ELECTRIC RAILWAY LEGAL DECISIONS

A
 Amusement Enterprise, Company Liable
 as Partner in 657
 Animals, With Fencing Law Danger to
 Deemed Imaginary 690
 Appliances—
 Deterioration of Mechanical 233
 Title to After Grant Ends 469
 Arrest, Road Officer Causing Wrongful
 595
 Assault, Company Entitled to Bill of Par-
 ticulars in Case of Alleged 626
 Automobiles, Duty of Persons in Charge
 of at Crossings 200

B
 Baggage, Company Not Liable for Loss
 of Hand 757
 Bars, Riding on Inside Running Board
 Outside of 790
 Bill of Particulars, Company Entitled to
 Have 626
 Boys Not Excused from Looking for Cars
 Bridges, Liability Under Ordinance as to
 Building 789

C
 Capital Stock, None Issued or Paid for
 Immaterial 333
 Cars—
 Asking Passengers to Change 233
 Diversion of to Restore Schedule 233
 Drinking Water Not Required on 595
 Equipment of with Powerful Search-
 light 595
 Injury to Bystander by Runaway 725
 Inspection of by Jury 267
 Lack of and Shortening Run of on
 Public Occasions 656
 Meeting of Where One is Stopped on
 Adjacent Track 468

Not to Stop Between Two Steam Roads 232
 Open Trapdoors or Defective Floors in
 and Inspection Thereof 790
 Ordinances as to Temperature, Sched-
 ules and Overcrowding of 333
 Ownership of Immaterial in Injury
 Case 300
 Passengers No Right on Particular 267
 Right to Transfers from Short to Long
 Service 627
 Risks Taken in Operating in Hilly
 Country and Bad Weather 725
 Running of Short-Service 627
 Running on Tracks Close Together 267
 Running-Time Orders and Uniform
 Spacing of 724
 Sufficient Identification of as for Pas-
 sengers 300
 Without Toilet Rooms or Water Tanks
 Not Up to Requirements 300
 Carrier of Freight Not a Street Railway. 690
 Carriers of Passengers, Judicial Notice
 Taken that Street Railway Com-
 panies Are 300
 Charter, Powers After Expiration of 20
 Child, Putting Off Car for Want of Fare 657
 Claim Agents, See Inspectors 690
 Common Carriers, What Constitutes 199
 Companies—
 Later Liable for Water Obstruction ... 52
 Not Deemed to Represent a Class. 333
 Liable as Partner in Amusement En-
 terprise 657
 Statute Authorizing to Take Roads. 20
 Compensation for Crossing Other Roads,
 When Payable 200
 Condemnation—
 None by Another Company 333
 Right to Cross Steam Roads Without ... 332
 Rights Acquired in with Filing of In-
 strument of Appropriation 789
 Conductors—
 Assenting to Changing of Seats 300

Dragging of One Into Pit at Shop 401
 Duties from Disabilities of Passengers 364
 Duty of to See Where Passengers are
 Before Starting Cars 690
 Duty from Seating of Passengers 19
 Injury to One Putting in Route Sign. 401
 Not Required to Look After Hand Bag-
 gage 757
 Settled Points as to Duties of 19
 Transfer Statements of 364
 Consolidation, Effect of on Franchises. 437
 Construction—
 None, Immaterial Between Companies. 333
 That Road Under is Street Railway as
 Authorized Cannot Be Questioned 332
 Contracts—
 Not Broken by Asking Passengers to
 Change Cars 233
 Permission to Cross Steam Road, Con-
 sideration for 206
 Controllers—
 Injury Caused by Flash from 232
 Inspection of by Jury 267
 Crossing Other Roads, Constitutional
 Right of 200
 Crossings, Duty of Persons in Charge of
 Automobiles or Other Vehicles at ... 200
 Crowds, Injury to Passengers by at Sub-
 way Stations 596
 Curves, Throwing of Passengers from
 Car at 233

D
 Damages—
 For Attempted Ejection 19
 For Expulsion for Refusal to Pay Fare
 Twice 401
 For Refusal of Transfer 757
 Rights Acquired in with Filing of In-
 strument of Appropriation 789
 Dogs Fighting on Tracks 139

E

Ejection—	
Damages for Account of Refusal to Pay Fare Twice	401
Damages for Attempted	19
Of Passenger with Expired Transfer Taken on Conductor's Assurance	757
Rule Requiring for Not Paying Fare	19
For Standing on Front Platform	267
For Poles in Unauthorized Places	233
Electric Railways—	
Care Required Crossing in Country	437
Interurban Not Subject to Grade-Crossing Act	725
Points as to Fares, Transfers and Duties of Conductors on	19
Right to Cross Other Roads	200
Right to Cross Steam Roads	332
Elevated Railways, Need Not Give Transfers to Leased	469
Employees—	
Duties of and to Track Repairers and Other	789
Instructions to Ignoring Ordinance	384
Sufficient Showing as to Being	300
Evidence—	
Admissible Relative to Fenders	436
Burden of Proof Where Gate Not Securely Fastened	401
Expense of Remedying Defect as	51
Of Prior Throwing at Cars	293
Of Right Speed	469
As to Working of Mechanical Device	401
Excursionists Carried Free, Duty to	199
Expense of Remedying Defect as Evidence	51
Experts, Right Speed Cannot be Shown by	469
Express Company, Rights as to Switch to Haul for	596
Extensions—	
Applicability of Statutes to	266
Name Does Not Make	469

F

Fares—	
Damages for Expulsion for Refusal to Pay Twice	401
Demanding Second Not Gross Negligence Nor Creative of Excessive Charge	757
Limited by that on Line Built or Purchased	300
Need Not Change \$10 Bills for	656
Putting Child Off Car for Want of	657
Settled Points Regarding	19
Fastenings Not Fictitious	468
Fellow Servants, Motormen and Conductors on Different Cars	51
Fences, Interurban Electric Road Requires	200
Fencing Law, Danger to Animals Deemed Imaginary with	690
Fenders—	
Choosing or Not Using Under Ordinance	436
Leaving Rear Down	364
Number and Kind of	364
Fire Department, Engines, etc., Right of Fireworks, Injury at Park from	52
Fixtures, Rails and Fastenings Not	468
Floors, Defective in Cars	790
Fourth of July, Shooting of Passenger on Franchises—	232
After End of	469
Of Common Carriers	199
Dea Molnes Perpetual Decree	433
Dea Molnes Perpetual Upheld	291
Effect of Consolidation on	437
Grants Expiring with Main Line	437
Immunity as to Paving Not Transferred with	724
Municipal and State Powers as to	364
Predecessor Not Having	20
Questioning Abuse or Non-Use of	333
Rules as to Construction of	436
Validity of Perpetual	214
Freight, Carrier of Not a Street Railway	690

G

Gates, Burden of Proof Where Not Securely Fastened	401
Grab Iron, Defectively Fastened	266
Grade of Railroad, No Right to Change	332

H

Headlight, Motorman Must Know if Burning	656
Highway, Unauthorized Railway in	595
Hilly Country, Risks Taken in Operating Cars in	725
Horses, Where Runway Collide with Cars	690

I

Injunctions—	
None Against Prosecution	333
To Protect Right to Old Roadbed	333
Injuries, Inspector Wrongfully Examining	620
Inspection, Insufficient of Cars	790
Inspectors, Liability for Wrongfully Examining Wounds	690

J

Juror, Having Book of Free Tickets	332
------------------------------------	-----

L

Lights—	
Failure to Turn on Block	51
Running of Car Without	52
Live Stock, Killing of on Unfenced Road	200
Looking, Boys Not Excused from	437

M

Main Line, Meaning of Expression in Grants	437
Motormen—	
Duty of Seeing Person on Trestle	469
Duty to Persons on Tracks	363
Duty Seeing Dogs on Tracks	199
Entitled to Rely on Orders from Starter	756
Inference from Occupying Place of Greatest Danger	725
Must Know Whether Headlight is Burning	656
Need Not Anticipate Runaway Horses	690

N

Negligence—	
Crossing Electric Railway in Country	437
Demanding Second Fare Not Gross	757
Error in Judgment as to Fender Not	364
High Speed with Searchlight as	595
In Riding on Inside Running Board Outside of Bar	790
No Rule of Putting Track Repairers in Class of Their Own	789
Not Presumed from Injury	299
Passing Teams Left Unguarded Not	363
Presumed from Trolley Pole Falling	19
Relative to Use of Fenders	436
Statutory Liability for	437
When Presumed from Injury	299
Notice, Judicial, Taken that Street Railway Company is Carrier of Passenger	300
Nuisance, Unauthorized Railway in Highway as	595
Numbers of Car, Motorman and Conductor, as to Plaintiff Furnishing	626

O

Orders—	
Motorman Entitled to Rely on from Starter	756
Running-Time, and Care	724
Ordinances—	
As to Ventilation, Temperature, Schedules and Overcrowding of Cars	333
Choosing or Not Using Fenders Under Giving Fire Department and Cars Respectively Right of Way	266
Liability Under as to Bridge Building Not Requiring Stop Between Tracks	232
Requiring Permit to Do Work Valid	626
Right Speed Cannot Be Shown by	469
Routing, Not Violated by Transferring Passengers	233
Valid as to Railroad Crossing by Cars	627
When Disregarded are Held Valid	364

P

Paralleling Steam Roads by Electric Lines	403, 412
Parks, Injury from Fireworks at	52
Partner, Company Liable as in Amusement Enterprise	657
Passengers—	
Allegation of Being Enough	300
Alighting When Car Approaching	468
As to Seeing Where They Are Before Starting Cars	690
Carried Beyond Destination Leaping from Car	468
Carried Free, Duty to	199
Catching Heel on Safety Tread	233
Duty as to Assisting to Alight	725
Duty to Relative to Safety of Seating	19
Duty to Tobacco Using in Vestibule	51
Extending Arms Out of Windows	267
Hit by Missiles Thrown at Motorman	299
Hitting Pole in Changing Seats	300
Injury to by Crowds at Subway Stations	596
Injury of on Rear Fender After Alighting	364
Injury to from Wrong Calling of Street	299
Left at Wrong Place, Duty of	299
Need Not Warn of Poles or Pillars	300
No Right on Particular Car	267
Not Bound to Notify of Gutter	233
Ordinances Providing for Welfare of	333
Regarding to be Had for Disabilities of	364
Requesting Them to "Move Quickly"	52
Right of Action of Given Wrong Transfers	724
Rising in Open Car to Get Attention	436
Shooting of on Fourth of July	232
Throwing of from Car at Curve	233
What Makes	690
When Duty to End	468
Who Are	199
Women with Children in Arms	62
Pavements—	
Duty Requiring Granite Block	266
What Duty to Repair Includes	724
Paving—	
Immunity as to Not Transferred	724

Not Required to Do Before Laying Tracks	401
Highest Court on Requirement for	468
Permits May be Required to Do Work	626
Pillars, Need Not Warn Passengers of	300
Pit, Conductor Dragged Into at Shop	401
Platforms—	
Liability for Areas of	414
Rules Forbidding Standing on Front	267
Woman Falling Between	52
Poles—	
Location of in Unauthorized Places	233
Need Not Warn Passengers of	300
Passenger Changing Seats Hit by	300
Title to After Grant Ends	469
Public Occasions, Lack of Cars and Shortening Runs on	656

R

Railroad—	
Interurban Electric Railway as	200
Interurban Road Not Under Grade-Crossing Act	725
Rails—	
Not Fictitious	468
Title to After Grant Ends	469
Railways—	
No, in Street for Private Parties	690
Power to Compel Removal of Unauthorized	595
Res Ipsa Loquitur—	
Applies to Catching Heel on Step	233
Applies to Collapse of Floor Beneath Passenger	790
Right of Way Across Street, Nature of	332
Roadbed—	
Acts Giving Right to Use Old	333
Duty to See Has Required Openings	52
Road Officer Causing Wrongful Arrest	595
Rules—	
For Ejection for Not Paying Fare	19
Forbidding Standing on Platform	267
Limiting Change Requirements to \$5 Upheld	656
Passengers Must Know Conductors Cannot Dispense with	757
Power to Make	51
Settled Regarding Electric Railways	19
Running Boards, Riding on Inside of Outside of Bar	790

S

Safety Tread, Injury from	233
Searchlight, Equipment of Car with Powerful	595
Signs—	
Duty Created by "Run Slow"	626
Injury to Conductor Putting in Route Single-Block System, Sufficiency of	51
Snow, Walking on Track to Avoid	363
Speed—	
Caro Required When Cars Run at High	364
Higher Rate of Permissible in Country	437
Right Cannot be Shown by Experts or Ordinances	469
Stairs, Injury from Fall Due to Tobacco on Station	756
Starter, Motorman Entitled to Rely on Orders from	756
State, Inquiry by into Street Occupation Statutes—	364
Applicability of to Extensions	266
Authorizing Operation of Roads	20
Drinking Water Not Required by	695
Right to Transfers Under	627
Steam Roads—	
Cars Not to be Stopped Between Two	232
Need Not Give Transfers to Leased	469
Paralleling of by Electric Lines	415
Permission to Cross Consideration for Assuming Responsibility	200
Right to Cross on Streets	332
Valid Ordinance as to Crossing by Cars	627
Steps—	
Catching of Heel on Metal on	233
Duty and Liability Arising from Muddy	725
Street Railway—	
Freight Carrier Not a	690
Judicial Notice Taken of as Carrier of Passengers	300
That Road Under Construction is Cannot be Questioned	332
Streets—	
Injury from Wrong Calling of	299
Nature of Right of Way Across	332
No Road in, for Private Party	690
Not Responsible for Safety of	233
Occupation of and State Inquiry	364
Subway Stations, Injury to Passengers by Crowds at	596
Switches, Rights as to Haul for Express Company	696

T

Taxation, Immunity from Not Transferred with Privileges	724
Teams, Passing Unguarded	363
Tickets—	
Conclusiveness of Transfer	19
Juror Having Book of Free	332
Prices for Sale of	300
Remedy for Passengers Given Wrong	19
Toilet Rooms Required	300
Track Repairers, Not Put in Class of Their Own	789

Tracks—
 Duty Requiring Paving..... 266
 May Secure Use of Without Exchange
 of Transfers 595
 Sign of Danger 437
 Use of Short Distance by Alleged
 Branch 469
 Walking on to Avoid Snow..... 363
 Transfers—
 Ejection of Passenger with Expired
 Taken on Conductor's Assurance.... 757
 Good Faith Required to Recover Pen-
 alty for Refusal of..... 756
 May Secure Use of Tracks Without
 Exchange of 595
 Need Not be Given to Leased Elevated
 or Steam Lines 469

No Rights Given by Intention to Issue 437
 Not One Continuous Trip for..... 363
 Ordinances v. Instructions as to..... 364
 Right of Action of Passengers Given
 Wrong 724
 Right to Not Limited to One Direction
 Right to from Short to Long Service
 Cars 627
 Rule as to Issuing at Time Asked for
 Upheld 402
 Settled Points Regarding..... 19

High-Voltage Third-Rail Line in California	17	New Semi-Convertible Cars for Toledo. (Illustrated.)	32
A New Governor on the New York Public Utilities	18	The Clark Soldered Rail Bond. (Illustrated.)	32
Airbrakes Versus Handbrakes	19		

With this issue the Electric Railway Review becomes a weekly publication. The reasons for the change are not far to seek. Firstly, a weekly journal is more in

The Weekly Electric Railway Review. line with the spirit of the times than a monthly and one of the chief excuses that we have for existence is that we are, or want to be, up to date. Secondly, we have

heard from a number of subscribers and other patrons, to the effect that, while the Review as a monthly was a most excellent paper and commanded the highest respect, it would be better as a weekly, and would have a much wider influence. Thirdly, we have the working organization to produce what we believe will be a first class weekly paper. Typographically it will be unchanged from the monthly. It will average about thirty-two pages of reading matter per issue; although more than this will be published whenever emergencies call for more. The subscription price will be two dollars per year and we believe the reader will get full value for his money. Old subscribers will receive the weekly to the expiration of their present subscriptions.

In a recent discussion of rotary converter substation apparatus at a meeting of the Western Society of Engineers in Chicago, it was stated by an engineer connected with the Chicago Edison Company that within the next six months rotary converters of a vertical type will be ready for operation. Owing to the limited headroom

Vertical Rotary Converters. In many of this company's substations, some of which are located in the basements of office buildings, a rotary converter of the vertical type would be very desirable. In the new design the shaft will be large in diameter and stationary, thus differing from the shaft of a vertical steam turbine. The revolving apparatus will be supported from the upper end of the shaft or pedestal, much like an umbrella. The first machines under construction will be of 2,000 kilowatts capacity, weighing 25 per cent less than usual for machines of like capacity. One of the desirable features of the new type of machine is that the brush ring will stand in a horizontal plane, and it will thus be possible to build a platform around

it so that all brushes will be equally accessible. The announcement of such a radical change in the design of the rotary converter as is demanded by limited headroom seems to emphasize the fact that the possibilities of substation improvement are by no means exhausted.

The Rapid Transit Railroad Commission of New York has given an illuminating example of what can be done by laymen to confound the operating official. It appears that the people who are enjoying the freedom, fresh air and lower rents above One Hundred and Thirty-seventh street did not think that these blessings compensated

for the extra time consumed in getting down-town in the subway under the stupidly impartial plan of falling in line behind the intermediate trains on the single down-town track between One Hundred and Thirty-second street station and Ninety-sixth street. It happened that the city had built a third or middle track extending from One Hundred and Thirty-seventh street down part way towards Ninety-sixth street, which was not being used for operation, and the minority of subway travelers living above One Hundred and Thirty-seventh street conceived the idea of appealing to the commission to compel the operating company to use this track for express trains down town in the morning and up-town in the evening. This would enable them to get ahead of some of the cars containing the amiable majority of residents living below One Hundred and Thirty-seventh street and to insinuate themselves into the single-track line again at a point farther down-town. They would thus get some such advantage as comes to persons who have sufficient aggressiveness to get to a ticket window without troubling themselves to fall in line, and the cars in line behind would suffer a corresponding delay. In this case the notable thing was that the commission not only winked at the plan but commanded it to be put in operation, although the operating officers explained that it would create another point of danger for the dispatcher to watch at the place where the express trains returned to the local track, and this point would be a particular source of apprehension because of the down grade from there to Ninety-

sixth street and the existence of only signal block termination between this junction and Ninety-sixth street, where the express trains switch again to the regular express tracks. Since this plan was put in effect it appears that the operating company still persists in being impartial and passengers on the express cars complain that they are sometimes stalled on the new third track waiting for a sufficient gap in the procession of piebald local cars to enable them to slip into line.

From time to time papers are presented in engineering societies discussing the relative merits of the many devices and construction schemes for lessening the ever-troublesome lightning troubles. There is hardly one of these discussions but that emphasizes the well-known fact that in order to protect the line from lightning dis-

charges advantage should be taken of the common characteristic of such discharges to move in straight paths. Thus it is recommended that no kinks or bends should be placed in the ground lines from lightning arresters. While these facts seem to be generally understood it is nevertheless true that many installations for both low and high-tension feeders are so arranged that if the kicking coil were ineffective the least reactive path from the outside feeder line to the interior of the building would be by the way of the wire carrying the dynamic current. This ineffective condition is brought about by the apparent lack of care in fixing the relative positions of the lightning equipment and the switching apparatus. Such details can best be taken care of in the preliminary design of the station building, and especially if it be for line entrances to a substation can the arrangement of the lightning arresters and the switching apparatus best be placed by using a wire tower. It is an easy matter to bring the high-tension wires into such a tower and across it to connect directly with the lightning arresters whose ground wires can pass straight down the tower wall to the earth. With an arrangement of this sort the connection for the dynamic current can be taken off by a tap making a curve such as will afford the sharpest angle in the path of the dynamic current. This doubling-back of the current wire calls into play the same principles that have been satisfactorily used on some foreign high-tension transmission lines, that is, carrying the transmission lines by the substations without curves in the wires to lightning arrester houses and making the taps to the building entrances at right or acute angles opposing the flow of the lightning discharge.

In a recent legal case in Arkansas the supreme court held as a correct declaration of law an instruction containing the statement, "A regulation forbidding passengers to stand upon the front platform is a reasonable and proper one. It is the duty of a passenger who is standing on the platform to go inside of the car when re-

quested to do so by a person in charge of the car, if there is standing room inside, although there are no vacant seats. And if a passenger refuses to comply with such request when there is room inside the car which can conveniently be reached, the servant of the company may lawfully eject him from the car." With regard to thus defining the term "ejected from the car" it is interesting to note that there were several of this electric railway company's cars standing at a station waiting to be loaded with passengers returning from a picnic, and while so waiting the plaintiff entered one of the cars. He became involved in a controversy with the conductor, then, without having paid his fare on the car, voluntarily left it to go upon the street where the conductor was standing, in order to maintain his contention. There the conductor informed him that he could not ride on his car, directing him to take passage on another car. With regard

to this the court held that the passenger was not denied the right to ride upon the defendant's car and was not, therefore, ejected therefrom. The court also said that where there is a train of cars for passengers, all of equal and sufficient accommodations, a passenger has no right to insist upon riding on any particular car.

NEW YORK TRANSPORTATION AND THE NEW GOVERNOR.

In his inaugural message to the legislature of the state of New York Governor Hughes recommends somewhat radical changes in the administration of the state's interests in public service corporations, notably in relation to transportation matters in greater New York. While the recommendation has reference also to the commission on gas and electricity, its chief effect if put into the form of a law would be upon the transportation interests, since it contemplates the abolition of the present board of rapid transit commissioners—which has served the public uncommonly well—and the establishment of a single board having jurisdiction over both interests. The governor expresses the opinion that there is no need of two separate commissions to deal with these subjects since similar principles are applicable to the decision of questions now within the jurisdiction of the two existing commissions and because in some cases the same questions are presented for the decision of both, there being some corporations subject to co-ordinate jurisdiction.

It should be noted, also, that the governor recommends a similar disposition of the bodies acting in similar capacities for the state. These state boards he would also consolidate, giving to one board jurisdiction over transportation matters, gas and electricity in the state outside of New York City, and to another board supervisory control over like matters in the city exclusively.

Whether or not such action at the present time is desirable is an open question. So far as the state outside of greater New York is concerned, the effect of such action should not be serious. The main difficulty is suggested in the message itself, in which it is recognized that "the problem of transportation in Greater New York demands special, prompt and comprehensive treatment." It is questionable if this would be secured by dethroning the present board of rapid transit commissioners, which, as before intimated, has performed its arduous duties with uncommon efficiency and zeal, just at the moment when it has outlined a comprehensive system of internal communication and by its completed work has given abundant evidence of its desire and ability to carry its plans to full fruition. Nor is it quite worthy of the great cause involved that the chief executive should base his reference to the necessity of means for securing better service upon existing lines upon, primarily, the fact that "in some portions of the city antiquated horse-cars may still be seen, giving picturesque emphasis to the disregard of the public convenience." It is true that non-electric and gasolineless power is employed in a few instances in hauling cars on crosstown lines on Manhattan Island; it is also true, or was two or three years ago, that mules were used in shifting cars on certain tracks of the Pennsylvania Railroad inside of Broad street station; and steam railroading had many years the start of transportation by electric power. It is trivial to cite instances in which expediency plays so conspicuous a part and in which the rights of the public are so little neglected.

That the operation of all railways within Greater New York should be under the supervision of one board will as a general proposition be unquestioned. Some difficulty may arise at the point where the authority of the proposed state and the proposed city boards meet, but doubtless this can be suitably regulated, since it is proposed that each board shall receive its authority from the state.

It is apparent that the new executive has prepared trou-

ble for the membership of the present legislature. He has placed dynamite under certain political structures which his economic sense points out as sufficiently dilapidated for removal in view of the more utilitarian structures which he desires to rear. The only thing to be feared is as to the zeal of the "contractor" to demolish more rapidly than he can rebuild in view of possible "labor troubles" among those who must do the actual work.

ELECTRIC RAILWAY EQUIPMENT IN 1907.

A very brief survey of the equipment available for electric railway service at the beginning of another new year is sufficient to convince the most skeptical operating man that no commercial transportation proposition need go by default for the lack of suitable apparatus to handle the business. It is not too much to say that the physical equipment necessary to maintain any speed specified up to a maximum of 100 miles per hour, can now be produced on contract guarantees. The wisdom of such selections of equipment is a matter of expert engineering, but the tools are at hand for the creation and shaping of every variety of transportation equipment from the urban system to the high-speed electrified network of steam trunk lines.

The production of the widest variety of electric railway machinery is now largely a matter of dollars and cents, but the selection of the most suitable apparatus for a given set of conditions is still a problem requiring careful analysis and step-by-step reasoning. In the field of power generation it is still a mooted point whether the gas engine, the steam turbine or the reciprocating engine is best suited for specific cases. The choice between the direct-current and the single-phase motor for interurban service is by no means settled practice as yet. The scientific proportioning of feeders to commercial traffic conditions, the design of durable track for heavy service, the best methods of fireproofing rolling stock and street railway buildings,—these and many other engineering problems need to be solved over and over again under divers conditions if progress is to continue.

It is remarkable how soon the standard equipment of railway service is superseded by new apparatus, even after two full decades of electric traction. Only six or seven years ago railway motors of the direct-current type had apparently reached such a high stage of development that little improvement could be foreseen, but as the lessons of operating experience were brought home in the maintenance expenses of rolling stock, more substantial construction was demanded and some of the best-known motors of that day have been set aside for machines of greater durability, increased armature and axle-bearing surface, larger commutators, three-point suspension gear cases and oil and waste lubricated bearings. Increase in weight has been merely nominal. The use of oil and waste lubrication in place of grease has been one of the most important improvements in railway motors in recent years, and it has resulted in a noteworthy increase in mileage with reduced maintenance expense.

Multiple-unit control methods have been much improved mechanically of late and the small amount of energy required to operate such systems is a triumph in design. The tendency is entirely away from breaking heavy currents on the platform in hand controllers which may short circuit and result in heavy damage suits by frightened passengers. Automatic acceleration is coming to be as favorably regarded on the street track as on the reserved right of way. In the power plant the gas engine is making a record for itself in economy; the alternating current steam turbine unit has "shown its mettle" on the score of operating simplicity and economy, particularly when using superheated steam, and the direct current steam turbine unit bids fair to be a useful adjunct of the motive power department as soon as the problems incidental to its construction can be settled.

Although it is difficult to forecast the development of equipment to be expected in the next year, it is safe to assume that reduced cost of operation and maintenance will be the chief objects sought by designers. First cost grows less and less important as the long-run economy becomes appreciated. This is particularly true in times as prosperous as the present. There is always an object in improving the mechanical strength of railway material, exposed as it is in so many cases to severe shocks and strains. Long after the electrical efficiency of a piece of machinery has been carried high up the line towards the practicable limit it remains possible to improve the mechanical structure. Increased facility of handling, greater ease of inspection and repair, more rugged design, less superfluous materials, better regulation and larger overload capacity are some of the desirable features in which we may expect the equipment of 1907 to surpass that of previous years. Along with these improvements it is to be hoped will go more careful records and analyses of repair costs and service performance on the part of operating companies. Only on the basis of such records can progress be given the most economical direction.

ROLLING STOCK ORDERED IN 1906.

Elsewhere in this issue is to be found a detailed statement of the equipment ordered by the electric railways of the United States, Canada and Mexico, which is effective testimony of the importance of electric traction interests as compared with those of the older and more assuming steam railways. The figures show that during 1906 contracts were placed for 6,104 cars and 23 electric locomotives, the cars including 851 for freight service. The balance of 5,253 cars were for passenger service which compares most favorably with the figures taken from *The Railway Age* showing orders placed by the steam roads calling for 3,402 cars for passenger equipment. In other words the electric railways ordered nearly 2,000 cars or 57.3 per cent more for passenger equipment than the steam lines. In view of the fact that the figures for the steam roads are probably even more complete than those of the electric railways they are impressive.

The cars ordered by the electric roads for passenger service include 3,730 cars for city service, 1,204 for interurban service and 319 to run on elevated lines. The number of cars of all kinds ordered to be built in company shops is 638 or 10.4 per cent. These figures and those showing 851 cars for freight service or 13.8 per cent are particularly interesting as indicating the extent to which the electric lines are devoting their attention to freight traffic and to the manner in which shops are being equipped to make the roads entirely independent of contract builders. The figures available showing equipment ordered by steam lines indicate that of the freight cars ordered to be built in company shops, the approximate total of all cars ordered for construction in company shops, was only 9.2 per cent. That is, the electric lines are, if anything, better equipped to care for their wants than the older steam lines.

Unfortunately, figures showing orders in previous years are not available for comparison, but assuming that the figures of American Street Railway Investments, which show the cars added to equipment of electric railways in 1905 to be 3,905 are fairly indicative of the orders placed during that year, the past year has seen an exceptional increase in equipment building activity by the electric lines. Taking the figures of the same authority there were on the lines of electric railways in the United States and Canada at the close of 1905 a total of 52,418 cars. The addition of 6,104 cars in 1906 represents an increase of 7.4 per cent.

At the close of the year ending June 1, 1905, the total mileage of electric lines in the United States and Canada was 34,106 and it is safe to assume that the addition of about 3,500 miles will give a reasonably accurate total at the close

of 1906 of approximately 37,600 miles. The figures of total equipment at the close of 1906 showing 88,577 cars indicate, therefore, that there are more than two cars to every mile of electrically operated track in the United States and Canada.

The figures tell their own story of the activity of electric traction lines during the past year, an activity which it is safe to say with respect to electric lines is without a parallel and which makes a showing that compares most favorably with that of the steam lines at the time of their greatest growth. How the permanence of the two works will compare is yet to be determined.

LOW STREET RAILWAY FARES IN CLEVELAND.

The Cleveland Electric Railway Company, which operates 236 miles of surface railways in the urban district of Cleveland, has just made a voluntary reduction in the rate of ticket fare to 3½ cents. The cash fare will remain at 5 cents but it is clear that it will seldom be paid except by visitors to Cleveland and residents who rarely use the street cars and there can be little doubt that from 90 to 95 per cent of the travel will be by those who use the seven-for-a-quarter tickets. Accompanying the reduction there is an extension of transfer privileges on the cross-town lines so that there can be no exception to the statement that Cleveland now has the lowest street railway fares, where the service available is considered, of any city in the world. The rates are absolutely lower than in any American city that is as large as Cleveland.

By this reduction the Cleveland Electric Railway puts in force as fully as it can without the legislative permission, which under the direction of Mayor Johnson, the city council still withholds, the terms of the offer on which the company is seeking a renewal of its rights to serve the public on the city streets. In other words the company has decided to afford its patrons a chance to test the merits of the consideration which, in addition to the surrender of existing rights, that although expiring at different dates from the year 1908 to 1929, have still an average life of from seven to eight years, it offers in exchange for a blanket grant running for twenty years and thus really amounting to a twelve-year extension of its rights. It is evidently the theory of the company that the users of the street cars will be so impressed with the convenience and desirability of the 3½-cent tickets and the more liberal transfers that the public sentiment created will force Mayor Johnson and his political associates to forego their own street railway plans and to deal with belated fairness with the old company. To an outsider this seems a most desirable result. The settlement of the prolonged and spectacular controversy over street railway fares and ownership which has long interfered with the development of Cleveland's facilities for urban transportation seems of the first importance and there is apparently no good reason for leaving it unsettled when an agreement can be made on the basis of the lowest fares in the world.

Hitherto Mayor Johnson has stood as a rock against the public demand for immediate settlement, but recent developments may have had the effect of decreasing his opposition. The disclosure of the extent of his financial interest in the Forest City Railway Company, the rival line which he promoted and for which he secured numerous franchise grants, has undoubtedly lessened his local prestige. The position of the old company has also been vastly strengthened by a series of favorable judicial decisions which have not only kept its officially favored rival from reaching the coveted terminal in the center of the city but have also indicated an early judicial determination that all of its alleged franchises are void and of no effect on account of Mayor Johnson's financial interest in them. It has already been held, in a carefully reasoned and thoroughly convincing opinion over-

ruling a demurrer, that if such a financial interest exists it utterly vitiates every franchise procured by the mayor and as Mayor Johnson has publicly admitted the facts necessary to establish the existence of such an interest it is merely a matter of weeks before the grants are declared invalid. Indeed, in evident anticipation of such a determination in the courts, the mayor's associates have organized a new corporation in which it is claimed that he has no interest, but as this corporation has very plainly inherited the mayor's extreme favor it is hardly likely that it will be judicially regarded as more than a very transparent subterfuge. Probably it was only formed in order to avoid a public admission of defeat pending negotiations for a settlement with the old company. The fact that the mayor's company is operating cars over five or six miles of streets at considerable daily loss which will continue at least as long as the legal situation remains unchanged is perhaps the strongest indication that a settlement will not be as obstinately opposed by Mayor Johnson as it has been since he was elected in 1901.

The fact is that there has been no time since the accession of the present management to the control of the companies consolidated in July, 1903, that lower fares were prevented by anything except the will of Mayor Johnson. Working in the ostensible interest of municipal ownership of Cleveland's street railways, a thing impossible under the laws of Ohio, and using the battle cry of "low fares" with 3-cent fares as the alleged object in view, Mayor Johnson has persistently stood in the way of a reduction by the old company, which is the only company that is in a shape to render the services wanted by the people of Cleveland, and his only real influence upon the situation has been to bring about a state of confusion, inconvenience and turmoil. If, as some of his critics assert, his real purpose was to harass and annoy the old company until he could purchase it for himself at a very low figure, he could not have worked more injury to the city and its interests.

The question whether, with American rates of wages and under American conditions, a street railway can be operated successfully on the basis of 3½-cent fares is one to which experience affords no adequate response. On a large scale, it has never before been attempted. The task which such figures devolve upon operating officers is a heavy one and only far-sighted and skilful operating officers can solve it—if it can be solved at all. How much help will come from the extra stimulation of traffic incident to the low rates and how much that stimulation will progress from year to year as the low fares affect the distribution of population within the urban district are now food for speculation rather than calculation. Street railway men will watch with profound interest the consequences of the low rates just inaugurated in Cleveland, if they are continued by the adoption of a proper agreement with the city, and will learn much from the results there. The results will also be watched by many who are not street railway men, who will want to know the influence of very low street railway charges upon the growth of cities and on their social and moral development.

Seeing San Antonio.

Visitors to San Antonio will have an opportunity to see all the points of interest in that city hereafter at a fair price, as the San Antonio Traction Company has solved the problem there of sightseeing by putting into service the first tourists' observation car which has ever been run in the south. The car, which has a seating capacity of 50 passengers, starts twice a day from the Alamo Plaza, in the center of the city, and with a guide to point out and explain all the points of interest as they are passed, runs for 35 miles over the traction company's lines, making a trip which with two short stop-overs, consumes four hours.—Southwestern Electrician.

STATISTICS OF ELECTRIC RAILWAY EQUIPMENT ORDERED IN 1906.

We present herewith a detailed statement of equipment ordered by the electric railways of the United States, Canada and Mexico during 1906, which we believe is the most complete list of the sort ever published. The figures are compiled from official sources and from the regular weekly records of the Electric Railway Review, and while necessarily incomplete in certain respects, as is the case with any lengthy detailed statistical statement, are as nearly accurate as it is possible to make them in the time available for their compilation. It will be well to bear in mind that the figures represent orders placed for equipment during the year just closed and not equipment delivered by the builders. The figures include both equipment built in contract and in company shops.

Unfortunately there are no figures for the previous year available, and hence it is impossible to state with any de-

gree of certainty, though it is more than possible, that the total of orders placed during 1906 was the largest in history, but the figures are at least effective testimony of the growth and importance of the electric traction field. For purposes of general interest the total has been divided into five classes, for which the figures are as follows:

Cars for city service.....	3,730
Cars for interurban service.....	1,204
Cars for elevated service.....	319
Freight cars	851
Electric locomotives	23
Total.....	6,127

Of the total, 638 cars or locomotives, or over 10 per cent, were built in company shops—evidence of the manner in which the electric railways are equipping their shops so as to be independently situated.

MARKET STREET TERMINAL, PHILADELPHIA.

In the Street Railway Review of September 15, 1905, brief reference was made to the joint terminal station to be located at the western terminus of the Philadelphia Rapid Transit Company's elevated line at Market and Sixty-ninth streets and to be used by the elevated lines of the Philadelphia Rapid Transit Company, by the Philadelphia & Westchester Traction Company and by the Philadelphia & Western Railroad. At a point 690 feet west of the western limit of the city of Philadelphia at Sixty-third street, the elevated, by an easy curve, reaches the private right of way of the company

Westchester pike along which extends the present line of the Philadelphia & Westchester Traction Company, the latter ending at Sixty-third street.

The main portion of the Philadelphia Rapid Transit Company's section of the building, which is the southeast corner, containing the main waiting room, has a front of 97 feet and a depth of 117 feet, with an extension at the rear of this 75 feet wide and 79 feet long, reaching over one emergency and two main passenger tracks and two platforms of the Philadelphia Rapid Transit Company. The platforms for this line are 350 feet long. Elevated cars will pass under the rear portion of the station from the east and discharge passengers

Market Street Terminal, Philadelphia—General Plan Showing Arrangement of Tracks and Buildings.

and passes on to the new terminal station, three-quarters of a mile beyond, as a double-track surface line.

Arrangement of Buildings and Tracks.

The station, a building of Flemish bond brick with terra cotta trimmings, which is approaching completion, consists at present of two parts, one built by the Philadelphia Rapid Transit Company and the other built by a subsidiary company of the Philadelphia & Westchester Traction Company. An addition to the present station with communication to the waiting room thereof will be added to the northern end of the present building by the Philadelphia & Western Railroad, the tracks of which pass through the Philadelphia Rapid Transit Company's terminal property about midway between the station building and the new shops.

The two parts of the present building are practically one, but each section was built by the company to occupy it. The station building faces the south on the Philadelphia &

at the north platform, from which they can reach the main waiting room exits above by means of a stairway. These exits on the west will lead to the Philadelphia & Westchester Traction Company trains and on the south to the street, or passengers arriving on the north platform may transfer to the platforms of the Philadelphia & Western Railroad. After discharging passengers the trains of the Rapid Transit Company proceed around a loop of 150 feet radius west of the platforms and return to the south side of the station platform to receive eastbound passengers. The main tracks continue in a direct line through the center of the loop and curve from the point of crossing with the loop tracks, continuing thence to the shops of the company. The loop track is gradually elevated to a sufficient height to avoid a crossing at grade at the intersection with the storage yard tracks. The loop is partially encircled by a second track leading from the storage yard to the station, extending under the station as

an emergency track upon which one or two extra trains ready for service will usually stand and from which freight may be unloaded at the basement level; and thence continuing as a switch track connection with the tracks of the Philadelphia & Westchester on the turnpike. It has been arranged that cars from the surface lines of the Philadelphia Rapid Transit Company shall proceed to the shops of the company over the Philadelphia & Westchester track from Sixty-third street and thence over this switch line. Reference to the general plan

of reinforced concrete consisting of slabs 8 inches thick supported on reinforced concrete girders and posts. The posts are 2 feet 6 inches square and are spaced 18 feet apart transversely and longitudinally. Where the platform passes under the building the columns are carried above the platform as circular reinforced concrete posts 20 inches in diameter, serving to support the arches over the tracks. The top of the arch is 16 feet and the platforms 3½ feet above the rail. The north or unloading platform is 15 feet wide and

Market Street Terminal, Philadelphia—Artist's Sketch of Building Now Under Construction.

makes evident the convenience with which cars may be taken out or returned to service at this terminal.

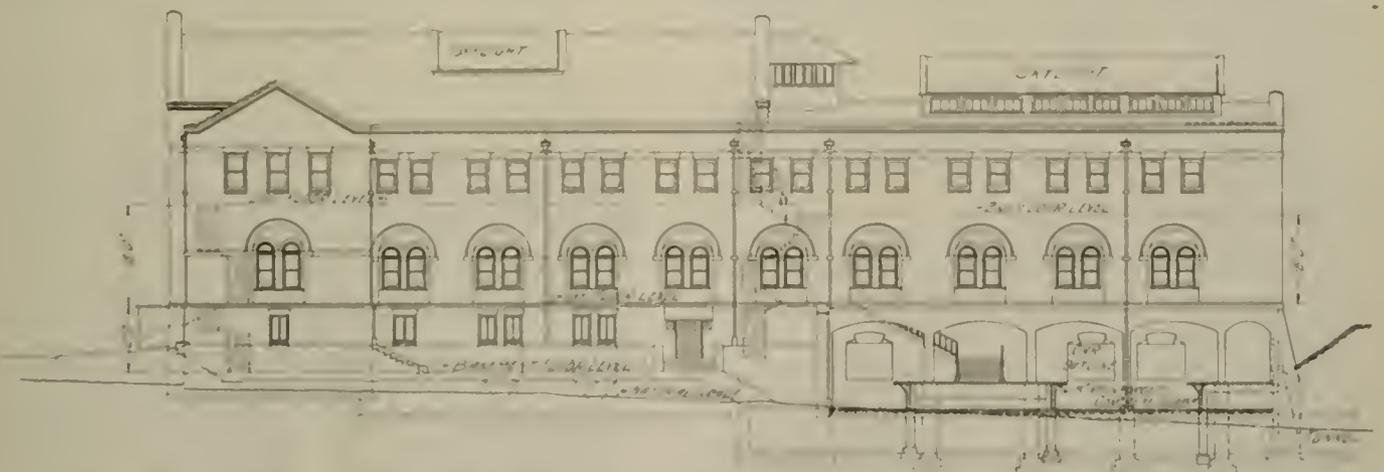

Building Details.

Entrance to the waiting room of the station on the first floor is through a handsome vestibule at the south end. The waiting room is 84 by 59 feet. Along its east side there are some small offices for the use of the personnel and retiring rooms for the public on the ground floor, while a balcony on the second floor serves another tier of offices on the east and south sides. On the west side of the waiting room are exits leading to a lobby 40 feet wide, extending the length of the room. The waiting room of the Philadelphia Rapid Transit Company will be used in common by all passengers. At the north end of the Rapid Transit waiting room are three passages, one admitting to stairs leading downward over the

the eastbound or loading platform, which also serves the emergency track and receives the stairway from the waiting room above, has a total width of 33 feet.

The Philadelphia & Westchester Traction Company's section of the building has a south frontage on the Philadelphia & Westchester turnpike of 172 feet and extends 117 feet back from the street. A portion of the east end, 54 feet wide, is two stories in height, with the upper floors to be devoted to office purposes.

The arrangement of the tracks in this portion of the station differs from that of the Rapid Transit Company's section, as this is a stub-end terminal while that of the Rapid Transit Company is a loop terminal. Five parallel tracks are provided in the station. These enter the building at approximately the waiting room level by means of an inclined

Market Street Terminal, Philadelphia—East Elevation Showing Platform Arrangement for Philadelphia Rapid Transit Trains.

emergency track to the eastbound platform and one giving exit from the westbound platform. The third is a corridor giving access to rooms for the accommodation of the trainmen and also will connect with the building to be erected by the Philadelphia & Western Railroad. Offices for the sale of tickets are placed in the waiting room on each side of the passage leading to the loading platform. The second floor of this portion of the building is to be occupied by offices, a room for the general use of the men, receiving room, etc.

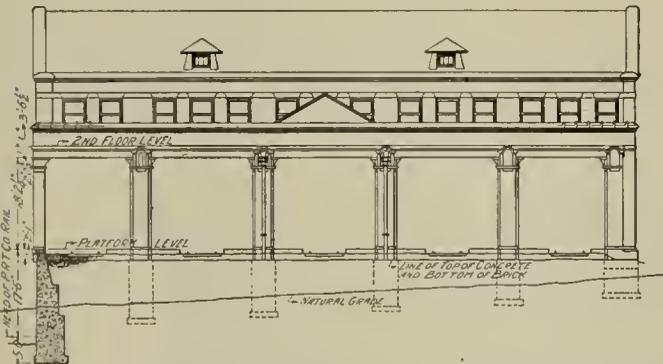

The Philadelphia Rapid Transit Company's platforms are

embankment supported by a concrete retaining wall between the property of the Westchester company and the tracks of the Philadelphia Rapid Transit Company. The Westchester company's terminal is served by a ladder arrangement of tracks. The track on the north side has a pit which can be used for the convenient inspection of cars. The loading tracks are 155 feet long excepting the one on the south side, which is only 128 feet. The platforms, of reinforced concrete, extend between the tracks a few inches above the level of the rail. Down the center of each of the four middle platforms,

which are 15 feet 5 3/4 inches wide, a fence will run the entire length of the trainshed, and a similar fence will extend from wall to wall along the west side of the 40-foot lobby previously mentioned. Double sliding gates will be provided in the latter fence at the end of each platform, so that passengers may be excluded from all platform sections excepting that leading to the train that they intend to take. The important advantages of this arrangement are: When the train enters the station the center platform fence prevents confusion between passengers being discharged and those taking a train on the other side of the platform. Passengers may be discharged on one side of a train, the doors on the opposite side of the train opened and a waiting crowd admitted at once from the other platform, thus separating the loading from the unloading platform and effecting an important saving of time and preventing confusion.

The trainshed has a flat reinforced concrete roof with a large skylight in the center. The supports for the trainshed are round iron columns filled with concrete and resting on concrete piers 4 feet 6 inches square placed below the platforms and spaced from 14 feet 6 inches to 17 feet apart, rows 19 feet 6 inches apart—the width necessary to accommodate a single track between two platforms. The north wall of the building is a continuation of the concrete retaining wall. This wall is designed to support 20-foot reinforced concrete girders 2 feet thick and 4 inches in diameter under the inspection pit and extending to the columns.

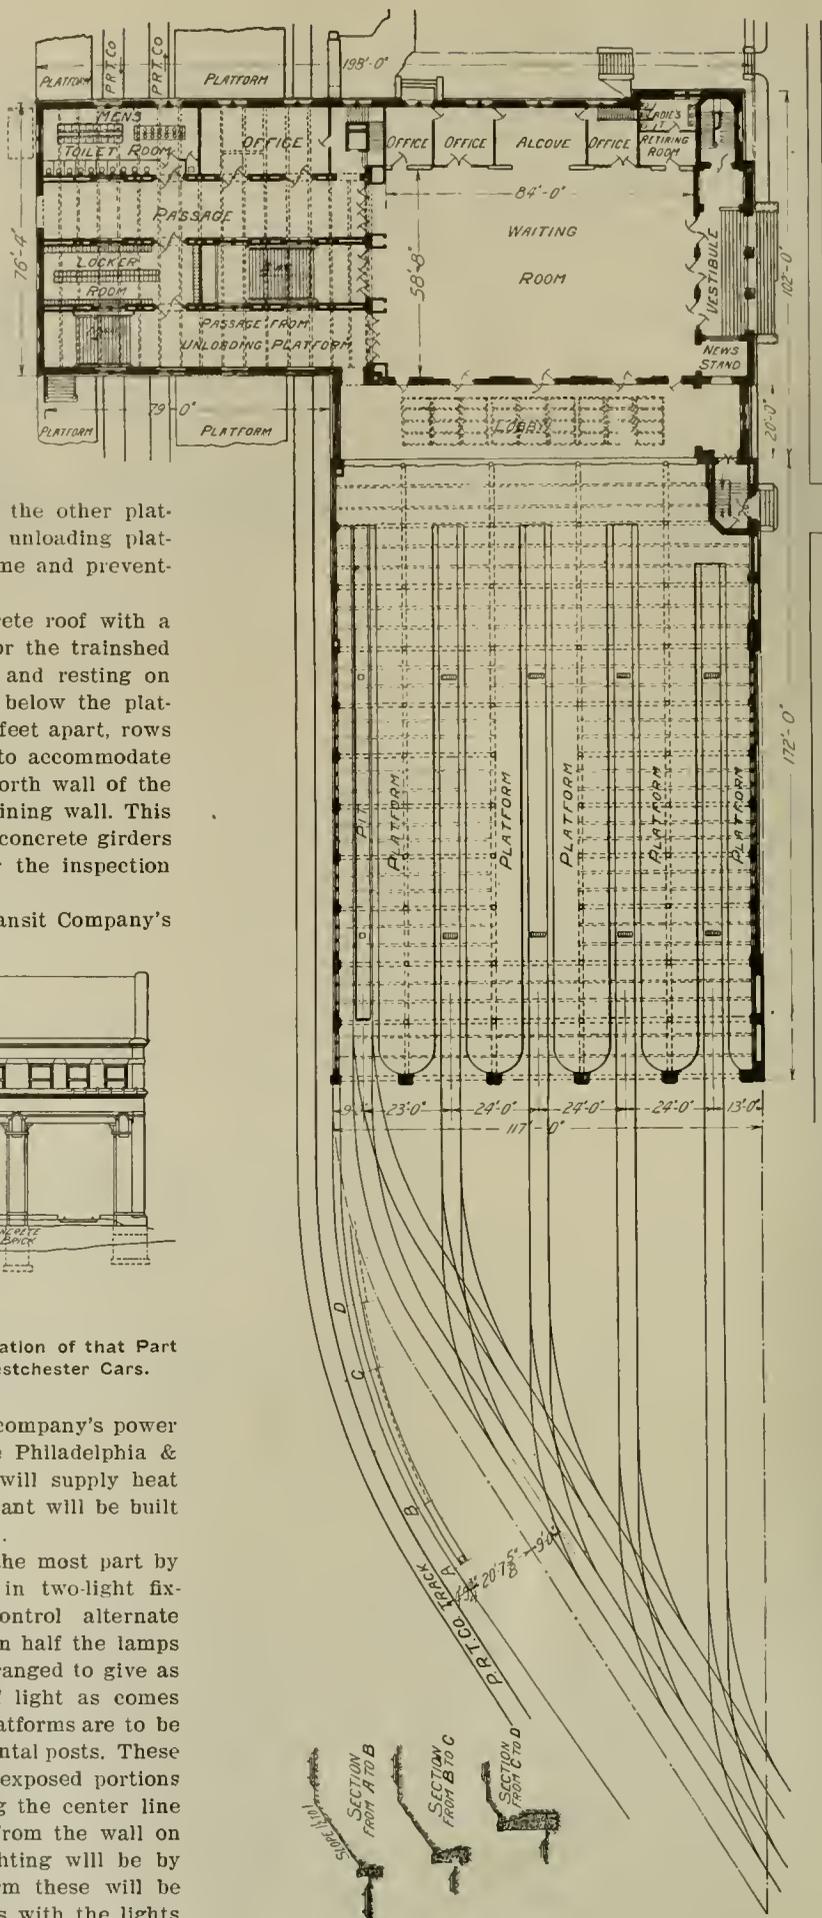

The lighting and heating of the Rapid Transit Company's

Market Street Terminal, Philadelphia—West Elevation of that Part of Terminal to be Used by Philadelphia & Westchester Cars.

portion of the station will be done from the company's power house, which is being built just north of the Philadelphia & Western Railroad right of way, and which will supply heat and light for the shops also. The heating plant will be built after the Warren & Webster vacuum system.

The station building will be lighted for the most part by 16-candlepower incandescent lights, chiefly in two-light fixtures, so wired that the switches will control alternate lights, giving even distribution of lights when half the lamps are in service. The ceiling lamps will be arranged to give as nearly as possible the same distribution of light as comes through the skylights in the day time. The platforms are to be lighted by arc lamps suspended from ornamental posts. These lights are spaced about 50 feet apart on the exposed portions of the platform, there being five lights along the center line of the double platform and five suspended from the wall on the single platform. Under the arches lighting will be by incandescent lamps. On the double platform these will be arranged in three rows of three-light fixtures with the lights

Market Street Terminal, Philadelphia—First-Floor Plan of Station.

spaced about 18 feet apart longitudinally. On the single platform there will be two rows similarly spaced. Arc lamps also will be used in the men's room on the second floor directly behind the main waiting room area. Here six lamps will be suspended from the roof trusses. The newel post lights will be attractive six-light fixtures or candelabra. The offices in the building will be equipped with a generous supply of wall sockets for desk lights, electric fans, etc.

The power station will be 100 feet square and will be

RECENT DEVELOPMENTS IN THE CLEVELAND STREET RAILWAY CONTROVERSY.

Following the decision of Judge Phillips, as reported in the last number of the Review, overruling the demurrer of the Municipal Traction Company in the so-called "blanket injunction" or "personal interest" case, and sustaining the right of the Cleveland Electric Railway Company to attack the former's franchises on the ground that Mayor John-

Market Street Terminal, Philadelphia—General View Showing Construction Work in Progress.

equipped with four boilers and two direct-connected engines driving direct-current generators. An interesting engineering feature of this building is the 150-foot circular stack of reinforced concrete. This stack will be 7 feet in diameter with a double shell for a height of 50 feet. The outside walls are 6 inches thick; there is an air space of 4-inches and the single shell is 5 inches thick. The stack is reinforced with steel T-bars and is being built by the Weber Steel-Concrete Chimney Company of Chicago. It is probable that an arrangement will be made whereby the station to be built by the Philadelphia & Western Railroad will be lighted from the power

son was financially interested in the company through guaranteeing its obligations, Councilman Hirstius, on December 10 introduced into the council a resolution calling for a list of the stockholders of the Forest City and Municipal companies. The resolution was passed by the council, but it was announced that both companies had anticipated it by filing their lists before the meeting convened. An examination of the lists showed that no city councilman or prominent city official held any stock directly in either company. The Municipal Traction Company's stock is held by five men, Du Pont, Howe, Stage, Wiebenson and Gref.

On December 14 the Low Fare Railway Company, of Cleveland, was incorporated at Columbus, with \$250,000 capital stock, by W. B. Colver, secretary of the Municipal Traction Company, and others, and it was generally believed that its intention was to take over any new franchises to be granted to the Municipal Traction Company in order to prevent their being involved in the "personal interest" litigation. This belief was confirmed on December 17 when the Municipal Traction Company presented at the council meeting a communication transferring to the Low Fare company its entire interest in a bid for a franchise around the Erie street cemetery, which was then pending, and which was thereupon granted to the Low Fare company. Another franchise was passed granting to W. B. Colver a franchise in East Seventy-First street, between Woodland avenue S. E. and Quincy avenue S. E. The Low Fare company also applied for another franchise for a line connecting with the present Municipal Traction lines, including a loop around the south side of the Public Square. The object of the company was explained after the meeting by F. C. Howe, a director of the Municipal Traction Company as follows:

"The Low Fare Railway Company is simply an anchor to windward for the three-cent fare movement in Cleveland. Even were the courts to declare all the franchises of the Forest City Railway Company to be invalid the city council could immediately grant the Low Fare Railway Company franchises over these routes as extensions. The consents filed with the city clerk did not specify consent to the Forest City Railway Company, but to the building of a street railroad. They would apply upon such extensions."

The "personal interest" suit of the Cleveland Electric

Market Street Terminal, Philadelphia—View of Subway to Philadelphia Rapid Transit Shops.

house of the Philadelphia Rapid Transit Company, but the Philadelphia & Westchester Traction Company will light its section of the building from its own current supply.

The Pittsburg Railways Company has recently tried the experiment of reserving cars for smokers. On the express trains to East Liberty the trailers on every other train are designated by a signal reading "Smoker." If the practice proves a success it will be extended so that the privilege may be enjoyed throughout the city

against the Municipal Traction and the city was called in Judge Phillip's court on December 17, but on the motion of attorneys for the former was continued until January 7. City Solicitor Baker had previously filed the city's answer, in which it was denied that the city had had any knowledge of the arrangement by which Mayor Johnson had guaranteed the company's obligations.

On December 19 the Cleveland Electric heard of a plan of the Municipal company to attempt to lay a crossing at midnight over the former's tracks at Detroit avenue and West Twenty-Eighth street and its attorneys immediately applied for an injunction. Judge Beacom did not grant the injunction, but accepted the promise of the Municipal Traction attorneys that no immediate attempt would be made to lay the crossing. Instead of laying the crossing the officials assembled workmen at midnight to erect poles and wires and instal switches in Superior avenue and on December 20 began operating cars over the tracks owned by the city on the Superior avenue viaduct. One of the company's grants had made Superior avenue "free territory," to be used jointly by both companies and it was the intention to run these cars in to the Public Square, but the Cleveland Electric attorneys, on the ground that the grants were invalid, secured from Judge Phillips a temporary restraining order. On December 24 Judge Phillips refused to dissolve the temporary injunction and in so doing foreshadowed the ultimate decision in the financial interest suit. The Municipal Traction Company's rights in Superior avenue are based on ordinances passed in September and October, 1906, permitting joint use of the Cleveland Electric tracks and fixing the amount of compensation therefor. Judge Phillips held that Mayor Johnson had admitted and that testimony had shown that he was financially interested in the company at the time he approved those ordinances and that it would be an abuse of the discretion of the court to refuse a temporary restraining order unless there appeared to be a probability of the order being refused on final hearing.

On the same day the Cleveland Press, which had guaranteed some of the Municipal Traction stock jointly with Mayor Johnson, announced that a new guarantee contract had been drawn relieving the mayor of all responsibility and that he was no longer interested in the company.

On Wednesday night, December 26, the Municipal Traction Company made another effort to reach the Public Square. The court having enjoined the use of the Cleveland Electric tracks it was decided to lay a temporary track on the surface of the pavement in Superior avenue. After the council meeting Wednesday night a permit was quietly secured from the board of public service and men and teams were suddenly brought forth from various secluded spots and put to work laying track and stringing wires on the side of the street from the end of the city's tracks on the Superior avenue viaduct, to the Public Square. The rails were laid on steel ties. As the tops of the rails were 5 inches above the pavement the space between the rails was decked over with planks, so that teams could use the track. The span wires were attached in advance to the poles, which were set in barrels filled with slag and cinders. Wagons loaded with stone were set alongside the poles and the poles were nailed to the sides of the wagons.

The work was stopped about 3 o'clock in the morning by an injunction secured by a property holder, after about a block of track had been laid.

On December 28 the city council granted the company a permit to lay the temporary track in Superior avenue, which had been stopped, but on Wednesday, January 2, Judge Beacom continued the temporary injunction, holding that the permits of the city council and the board of public service were unlawful. The injunction also requires the removal of the track already laid and will hold until the decision of the "personal interest" suit.

On Monday, December 31, the council granted the Low Fare company a franchise for a line on Sunner avenue connecting the proposed Superior street line with the Forest City main line. The next day Judge Ford, of the common pleas court, issued an injunction restraining the company from doing any work before Friday noon.

On Monday the Cleveland Electric company began selling seven tickets for a quarter with double transfers on cross-town lines for the purpose of demonstrating the meaning of the company's proposition already submitted to the city council, which the company stands ready to carry out.

THE ROTARY CONVERTER SUBSTATION.

On December 21 Mr. R. F. Schuchardt delivered an address before the Western Society of Engineers, Chicago, Ill., on "The Rotary Converter Substation." The speaker discussed very thoroughly the fundamental theories and constructional details of the rotary converter and its necessary auxiliaries as found in railway and lighting substations. During the address many lantern slides were exhibited by the way of illustration and interior views of substations of the Chicago Edison and the Commonwealth Electric companies, with which the speaker is connected, were presented.

After this very thorough treatment of the rotary-converter substation considered electrically, Mr. Ernest F. Smith, superintendent of substations for the same companies, was called upon. He discussed the mechanical side of substation operation and included in his remarks the following:

Brush Economy.

The question of brush economy is one of extreme importance, especially when considered in connection with the operation of a large system, such as that of the Chicago Edison and Commonwealth Electric companies. In these systems there are in operation about 70 rotary converters and when we consider that the cost of a complete set of brushes for a rotary converter ranges from \$40 for a 500-kw. machine to \$180 for a 2,000-kw. machine, which means that the cost of brushes only of the converters in operation in the system mentioned is slightly in excess of \$4,000, it will readily be seen that brush economy is quite an important subject.

This matter has been given a good deal of careful study and by careful attention to systematic maintenance of brushes, commutators, and collector rings, the life of a set of direct-current brushes has been increased until it is from four to five years at the present time. This figure includes wearing out and destruction of brushes from all causes, including the wear on commutator, sanding, cracking due to vibrations, explosions due to rapid expansion and burning off of pigtails or unsweating of pigtail caps due to poor contact or defective distribution of load between brushes.

Considering wear and loss due to sanding only, the life of a direct-current brush is equivalent to about eight years, and considering wear only the life would be about 10 years for an alternating-current copper brush and 20 years for a carbon brush. It will thus be seen that, considering 20 years as the maximum possible life and four years as the actual life obtained in practice, that the percentage of life in the Edison and Commonwealth systems is about 25 per cent. This is considered to be comparatively high.

Setting Brushes.

There are 430 brushes on a 2,000-kw. machine and 112 on a 500-kw. machine, necessitating constant care and attention in order to keep them in prime condition. The matter of properly setting the brushes is of the utmost importance. The brush-holder studs on the direct-current side should be accurately and equally spaced all around the commutator and a line of brushes of a given polarity across the commutator should be absolutely parallel with the commutator bars. The positive brushes on the alternate positive studs should be staggered with reference to each other, so as to cover the entire commutator surface, instead of allowing the brushes of a given polarity to track and form grooves.

Experience indicates that a carbon brush tension of about 1½ pounds per square inch gives most satisfactory service and contributes to the life of the brush and commutator. The copper brushes on the alternating-current side give very satisfactory results when the tension is from 1½ pounds with a 500-kw. to 2 pounds with a 1,000 or 2,000-kw. unit. The current density in the contact surface of the ro-

tary-converter brushes in use in the system referred to ranges from 27.6 amperes per square inch for a 500-kw. rotary to 33.3 amperes per square inch for 2,000-kw. rotary on the direct-current end and from 50 to 57 amperes per square inch for the laminated copper brushes on the alternating-current end.

The equivalent of one complete row of carbon brushes is treated with dynamo oil and distributed in the brush holders throughout the commutator in such a manner as to bear on the entire commutator surface. This is for the purpose of effectively lubricating the commutator, thereby reducing friction and noise in operation. The method of treatment consists of immersing the carbon brushes in boiling oil for a period of about an hour, after which they are removed and dried at a temperature of 200 or 300 degrees F. for a period of half an hour or more. The commutator surface is frequently wiped with a clean piece of cheesecloth, and when the machine is about to be shut down and is well heated up a piece of cheese-cloth bearing a trace of oil is wiped across the commutator, with a clean, dry piece of cheese-cloth bearing upon the commutator surface immediately back of the oiled cloth. This method of maintenance will keep the commutator and brush surfaces in good condition.

The alternating-current brushes are staggered on the ring, so as to get an even wear and it is found with good care that it is not necessary to retrim them or seriously disturb their adjustment more frequently than about once a year. They are then properly trimmed and beveled and replaced on the machine. A very light application of vaseline or machine oil from time to time, while the machine is in operation, will effectively prevent cutting of the ring or excessive wear on the copper brushes. This treatment will preserve the commutator and collector rings in good condition, requiring the turning down of the collectors at intervals of about five years, and turning of the direct-current commutators at intervals of from five to ten years. As the cost of turning down commutators and collector rings ranges from \$58 for a 500-kw. machine to \$110 for a 2,000-kw. machine, it will readily be seen that there is room for substantial saving by the proper care of these parts.

Oil Economy.

In connection with oil economy statistics show that the average consumption of oil for each machine in the system during the past year has been 3.2 gallons. This is equivalent to a life of four years for the oil. The temperature of the bearings is very closely observed with reference to the temperature of the surrounding air, and in all cases where the rise in temperature exceeds 15 degrees C. the oil is promptly filtered and replaced in the bearings. This will usually result in lowering the temperature. If the temperature still remains high the cause is further investigated and removed.

The average rise in temperature of all bearings in the Edison and Commonwealth systems at the present time is approximately 14 degrees C., the minimum being about 7 degrees C. A portable filter is used for the purpose of filtering oil and is sent from one substation to another as required.

Blowers.

It is extremely important that the condition of the blower equipment for the air-blast transformers and regulators be properly maintained at all times, as the shutting down of the blower would seriously affect the operation of the converter units at times of heavy load, and on account of the serious overheating of transformers and regulators which would follow, it would soon become necessary to shut down the main units if the air blast were not restored.

The screens used for cleaning the air are regularly inspected and washed and blown out and the ventilating ducts of the transformers and regulators are thoroughly blown out and cleaned from once to twice a week.

Starting and Synchronizing.

In connection with the operation of such substations, accurate synchronizing is about the most important specific operation required to be performed in a substation. Any serious inaccuracy in performing this operation will result in fracturing the castings of the potential regulator, or if there is no regulator used in connection with the unit, the armature conductors of the converter are likely to be drawn out of their slots or the transformer structure seriously strained.

In connection with the regular shutting down of rotary converters which are normally started from the direct-current end, it is extremely important that the field circuit of the converter should be left closed until the machine stops rotating. This is necessary in order to thoroughly de-

magnetize the transformer cores and it is partially true in connection with diametrically connected units.

Under certain conditions the converter may stop with the direct-current brushes resting on the commutator bars which are connected to the same armature conductors to which the collector rings are connected, which are in turn connected to the terminals of a given transformer coil. This places this transformer coil in short circuit with the armature windings of the converter. If this transformer coil has previously been demagnetized, its impedance will be sufficient, upon throwing the starting current into the armature of the converter, to prevent an undue amount of current from passing through the transformer instead of through the armature of the converter, and the machine will start. However, if the transformer had not previously been demagnetized and the field circuit had been opened at a time when the magnetization of the transformer coil was at a maximum in the same direction as would be caused by the passage of the starting current through the transformer coil, then there would be practically no impedance and the practical equivalent of a short circuit would be connected to the direct-current brushes of the converter, thus rendering it impossible to start the machine. In this case the brushes should be lifted from the alternating-current rings, and the transformer momentarily connected to the high-tension line, thus changing its magnetic state to a more favorable condition.

Starting After a Shut-Down.

In connection with starting up the system after a general shutdown, if the shutdown has been of such long duration as to result in fully discharging the storage batteries, thereby leaving many of the substations without an adequate source of supply for starting from the direct-current end in the regular way, the procedure employed in some of the large systems is to start a large group of converters from a turbine or prime mover from rest with low-frequency, low-voltage, multi-phase currents. The field circuits and direct-current switches of the converters are left open and the unit is connected on the alternating-current side only. A direct-current voltmeter is connected to the direct-current terminals of the machine and as soon as the turbine begins to rotate slowly, slight vibrations of the voltmeter needle will be observed. This action will continue, gradually increasing in amplitude until the rotary begins to turn. After the converter has made a few complete revolutions the voltmeter needle will have discontinued vibrating, and if the field circuit has not been closed at the proper instant, will have taken up a fixed position either above or below zero, indicating correct or incorrect polarity. The field circuit should be closed as the needle is swinging past zero in the direction of correct polarity, thus locking the converter into synchronism with the generator and insuring correct polarity if the operator is skilful in performing the operation.

The power factor is adjusted to unity by means of the field rheostat and as soon as the converter potential is equal to the system potential, the direct-current switches of the converters are closed and other converters are started from the direct-current side. They are then synchronized with the low-voltage, low-frequency line and other generators are synchronized under similar conditions at the power house. Another stage of acceleration then takes place and this action is repeated until the entire system load has been raised to the normal direct-current potential.

In our operating practice covering this emergency procedure machines of a rated capacity of 11,000 kw. have been thus started from rest and machines of additional capacity of 7,500 kw. were immediately started, receiving direct current from them, after which they were synchronized with the low-voltage, low-frequency lines. Additional machines of a rated capacity of 11,500 kw. were thrown onto the line merely as a drag, making a total of 30,000 kw. connected to one turbine when the final stage of acceleration was started. As the turbine used was one of the older units, it is believed that with a new unit of greater capacity a much larger load could be brought up from rest.

In some of these trials the time required to perform all operations from the time the converter started turning until the second converter had been started with direct current received from the first and synchronized and cut in with the low-voltage, low-frequency line, was as low as 30 seconds. The average time, however, is considerably higher.

The time required to start machines from direct current and under regular conditions ranges from about 51 seconds for a 500 kw. machine to about 1½ minutes with a 1,000 kw. machine, not including time required for regulator operation. It is not often necessary to operate the regulator after a shutdown, but in case it should become so, under extreme

conditions necessitating running from the neutral point, the time for a 500-kw. machine would be about 1 minute and 50 seconds, and for a 1,000-kw. converter about 2 minutes and 27 seconds.

NEW ENGLAND STREET RAILWAY CLUB.

The December meeting of the New England Street Railway Club was held at the American House, Boston, on the evening of December 27. President Paul Winsor was in the chair and the speaker of the evening was Mr. Jacob B. Struble of the Union Switch & Signal Company, Swissvale, Pa., his subject being "Railway Signaling."

Mr. Struble classified all signals as visual or audible, stating that form and color are the main division of visual signals with respect to their essential characteristics. The semaphore is the type of visual signal in widest use and in practically all cases a horizontal inclination of the arm stands for the danger position and the downward inclination for safety. Recently an upward inclination of the arm has been favored somewhat for a clear indication. It has been found difficult to secure distinctive colors enough for night indications. The well-defined conspicuous form of the semaphore arm is perhaps its most striking advantage. Various forms of disc signals were also discussed. These were said to be of questionable value for very high-speed service on account of their possible obscuration by snow and reflected sunlight. The latter cause tends to make disc signals better for night than for day work. Home and distant signals were then fully explained by the speaker.

A brief reference was made to the staff system and its value for single-track service emphasized. The Fontaine system of time spacing was instanced and comment was offered upon the fields of the telegraph block and manual lock and block systems. The former depends upon the absence of mistakes and is weak in this respect. The track-circuit automatic block system is probably the best of signaling methods. Mr. Struble described the function of the track circuit at some length and emphasized its ability to give danger indications in case any part of the equipment fails. In all automatic signals gravity should be used to return the signal to the danger position.

The automatic signal reduces the cost of operation through its lessening of the wages account. Discussing cab signals the speaker stated that the future of these is extremely difficult to predict, because thus far they do not seem to work out well in practice. Even if the mechanical and electrical problems of the cab signal could be solved a difficulty remains on account of the division of the motorman or engineer's attention between the cab signal and the track ahead. Attention cannot well be divided between the signal and the roadbed without neglecting one or the other. Mr. Struble pointed out that there is not as yet any system which interlocks both train and signal, though on the Boston and New York rapid transit systems the trains are automatically stopped in case they are run past danger signals. The derail is too drastic a means of protection except at certain crossings.

A brief description was given of the use of alternating-current block signals in track circuits carrying direct-current power in the rails. Mr. Struble closed his paper with a short discussion of the interurban signaling situation. No entirely satisfactory system of interurban signaling has thus far been produced, in his opinion. The fact that the rails are often covered with dirt on account of highway locations, is troublesome in the operation and maintenance of first-class track circuits. On many lines the use of single tracks and sidings with cars operating in both directions on close intervals, makes it exceedingly difficult to instal a successful automatic signal. Signals satisfactory in many particulars can be had, but it is difficult to find any single scheme capable of counting in and out double or triple headers in each direction,

through a block. The increase of traffic on railways has led to the organization of regular signal engineering departments on many systems and a more general appreciation of the art of signaling is everywhere becoming apparent.

Following the reading of Mr. Struble's paper a general discussion of signal work was held. Among the speakers were Messrs. H. C. Page of the Springfield (Mass.) system; General Superintendent Lee of the Boston & Maine Railroad; M. C. Brush of Newton; E. P. Shaw, Jr., of the Boston & Worcester Street Railway; Inspector of Signals Smith of the Boston Elevated Railway, and C. E. Potter of New Bedford. The meeting closed at 9:30 p. m.

CONTROVERSY OVER T-RAILS IN COLUMBUS.

The question of whether the interurban railway systems entering Columbus, O., will be allowed to lay T-rails in the city, or will be compelled to put up with the grooved rails will probably now be settled in the courts of the state. This is the result of a controversy caused by an attempt on the part of the city engineer to compel the Indiana Columbus & Eastern Traction Company to replace its T-rails on McDowell street, an unimproved street, with grooved rails so that the city can proceed with a paving contract.

The matter was threshed out in two open meetings, before the board of public service, in which the railway interests were represented by several business and improvement associations of the city and J. L. Adams, general manager of the western division of the Indiana Columbus & Eastern, and the advocates of the grooved rail, by City Civil Engineer Maetzel and Frederick L. Ford, city engineer of Hartford, Conn., who was brought to Columbus by a Columbus newspaper to furnish expert information regarding rails and the grooved rail in particular. At the close of the second meeting Mr. Adams handed a written statement to the secretary of the board of public service, which announced that his company refused absolutely to replace the T-rail on McDowell street with grooved rails. This means that the whole proposition will probably go into the courts for settlement and will undoubtedly be carried through to the supreme court.

Motives back of the attempt to force the grooved rail onto the interurban system on streets where it has succeeded in getting the T-rails, are said to be political and personal, while business men and associations of the city who have the best interests of the city at heart are in favor of allowing the traction company to put in the special T-rail that admits of paving up flush with a special paving block. They recognize that the future development of the interurban systems which have proved of great financial benefit to the business interests of the city, depends largely upon the attitude of the city administration on the T-rail proposition.

Fast limited passenger service from Zanesville to Indianapolis has been planned by the Indiana Columbus & Eastern Traction Company and to make such service safe the company will be obliged to put on heavier cars with the standard depth of flange on the wheels and these flanges can not be operated over grooved rails. Thus the T-rail controversy is not only an important one to the city of Columbus, but effects improvements and the character of passenger and freight service all over the Schoepf system in Indiana and Ohio.

The company not only agrees to do its part in improving and paving the streets and putting in the special paving blocks next to the T-rail, but it agrees to put up a million-dollar terminal passenger station and make other improvements in Columbus, if its plans are not blocked by the city insisting on the grooved rail.

Officials of the Indiana Columbus & Eastern believe they will win out in the fight should it be taken into the courts, because they are already using the T-rail on the street in question and the board of public service has given the com-

pany permission to lay this form of rail on several other streets of the city.

POWER HOUSE OF THE HUDSON TUNNEL SYSTEM.

Construction work is now in progress on a new power house which will generate current for operating the cars through the several tunnels of the Hudson Companies under the Hudson river between New York and New Jersey, and also current for operating passenger elevators and lighting the new terminal office building in New York city. This tunnel work was described in detail in the *Electric Railway Review*, November, 1906, page 593. The power station will be located in Jersey City on a block bounded by Washington, Green, Bay and First streets. The building will have a length of 230 feet from north to south and a width of 200 feet. The height from sidewalk to top of monitors will be 105 feet.

The interior of the structure comprises a boiler house and an operating and electrical room. The latter room extends the entire length of the building and will contain, on the north side, galleries for controlling the generating machinery and the local substation in the power house. The electrical generating plant will comprise two 3,000-kw. turbo-generators and three 6,000-kw. turbo-generators, a total generating capacity of 24,000 kw. or 32,409 hp. The immediate installation will aggregate 18,000-kw. capacity, but the structure is designed for an ultimate generating capacity of 36,000 kw.

The building with its facade of selected red brick and with doors and window frames of metal, will be as thoroughly fireproof as it is possible to build. In the windows wired glass will be used. A skylight with copper-covered metal work will run the entire length of the building.

Coal will be received at the eastern end of the boiler house and elevated from the yards to distributing conveyors which will carry it to several coal bunkers located in the top of the building. These bunkers will have a storage capacity of 5,000 tons. From here the fuel will be fed by gravity and automatic stokers to the furnaces on the ground floor.

The boiler house was designed to accommodate 16 water-tube boilers each having 9,000 square feet of effective heating surface, or 9,000 hp. as customarily rated. It is thought that these boiler units are larger than any heretofore used in this country. The boiler settings will be encased in steel and all openings in these casings will be made airtight. This type of construction will require details new to American boiler practice. The boilers will be fitted with superheaters and all piping and valves will be designed for use with superheated steam. For each 6,000 kw. of generating capacity there will be provided four boilers and for each set of four boilers one chimney; thus the plant will be developed on a sectional basis.

The chimneys are to be of heavy steel plates lined with nine inches of brick supported in sections, so that any portion of the lining may be renewed or repaired without disturbing other sections. The inside diameter of each chimney will be 10 feet 6 inches and it will rise to a point 175 feet above the street level. The bases of the chimneys will be supported on steel columns to permit of added space in the boiler rooms. The turbo-generators will be of the vertical shaft type and the plant will be equipped with apparatus assuring the maximum reliability and economy of production.

The tunnel trains, which will run as far north as Herald Square, as far east as Astor Place and as far west as Newark, will be operated by current from this new station. The tunnels along the various lines on both sides of the Hudson river will be lighted by current from the Jersey City power house.

The general design of the power plant, including the mechanical equipment, has been in charge of Mr. J. Van Vleck, and the electrical equipment has been designed by Mr. L. B. Stillwell. The power-house superstructure was designed by Robins & Oakman, architects, New York city.

EQUIPMENT OF THE TEXAS TRACTION COMPANY.

Contracts have been let by the Texas Traction Company for the equipment of a 65-mile electric road between Dallas and Sherman, Tex. The new line will parallel the Missouri Kansas & Texas road between the two cities and will be one of the longest electric roads in the state. While the apparatus is standard direct-current throughout, the equipment, in some respects, presents features of interest.

The country through which the new line will run is flat and rolling, there being no grades exceeding one per cent and a maximum curvature of but three degrees. A private right of way has been established by the company. The run between Dallas and Sherman will be made in 2 hours and 30 minutes. This schedule includes a 15-minute run within the city limits of Dallas, where the cars must necessarily be operated at lower speeds. While the main traffic will be of an express nature, stops have been provided about every two miles to take care of the local travel.

Fifteen car equipments will be provided for the first schedules. These will be of the standard interurban type, each 50 feet long, equipped with four GE-73 (75 horsepower) standard direct-current motors and the Sprague-General Electric type M system of multiple-unit control. Each car will be further provided with General Electric airbrakes and compressors.

Power for the new road will be generated by steam at McKinney, a town located about midway between Dallas and Sherman. The main power station equipment will include two 1,000-kilowatt Curtis steam turbo-generators working under a steam pressure of 150 pounds at the throttle with 125 degrees of superheat. The turbines will operate condensing. Current will be generated at 2,200 volts and 25 cycles and stepped up for transmission to 19,100 volts. For exciting the fields, two 35-kilowatt generator sets will be provided. The three-phase current from each of the turbo-generators will be transformed in a set of three 330-kilowatt, air-blast transformers, with one spare transformer as a reserve. To supply air for cooling, duplicate blower sets will be furnished, one set being driven by an induction motor, the other by a direct-current motor. Each blower will have a capacity of 10,000 cubic feet.

Six substations will be provided, including one at the main station and a portable equipment. The portable substation comprises a special car containing a 300-kilowatt rotary converter, air-blast transformer and suitable switching apparatus for cutting into the transmission system wherever necessary. This equipment renders unnecessary the duplication of rotary converters at the fixed substations, as it can be shifted to various parts of the line and used as an emergency station or auxiliary in case of need. Each of the regular substations will be equipped with a 300-kilowatt, 600-volt rotary converter with the necessary switchboards, oil-cooled transformers, and lightning arresters. The substations will be interconnected by high tension transmission lines, operated initially at 19,100 volts. Eventually, however, a transmission potential of 33,000 volts will probably be used, and for this purpose taps will be provided for Y-connection of the transformers. With the few exceptions noted the new line follows, in general, the standard direct-current practice of the General Electric Company.

J. F. Strickland is president of the Texas Traction Company and E. A. Jones chief engineer, both of Dallas, Tex., where the offices of the company are located.

INTERURBAN MAP OF THE CENTRAL STATES.

(WITH INSET.)

The map of the Central States, issued as a supplement to this number of the Electric Railway Review, when compared with a similar one published by the Street Railway Review a year ago, affords an interesting basis for studying the progress in interurban railway construction in the year 1906. During the past year there have been opened to traffic a comparatively large number of new interurban roads, but perhaps even more mileage has been built as extensions of already operating lines. Elsewhere in this issue appear statistics showing the rolling stock purchased during the year and used for these new lines and as additions to existing equipment.

This new map, for which we are indebted to The Arnold Company, Chicago, is thought to be complete. However, should there be errors the Review will be grateful for any information that will assist in making its reference files more complete.

CHICAGO TRACTION SITUATION.

Although the Chicago traction ordinances are still in the hands of the local transportation committee the situation has progressed rapidly since the last issue of the Review. The Chicago City Railway ordinance is now ready to be reported to the city council and unless further cause for delay arises will be submitted at the next meeting. The ordinance for the Chicago Union Traction Company, which is the same as the other except in a few details where changes are necessary on account of the difference in locality and the internal financial complications in the company, is now in the hands of the committee receiving the finishing touches.

The principal points of difficulty in the Chicago City ordinance, which also applied generally to the Union Traction Company, were cleared up at a conference between the representatives of the city and the companies on December 15. It was then agreed that in the event of purchase by the city, the valuation of the companies' property, both tangible and intangible, shall be \$50,000,000, which represents a compromise between the companies' figures of approximately \$74,000,000, and the city's experts' estimate of about \$46,000,000. Of this amount \$29,000,000 is apportioned to the Chicago Union Traction and \$21,000,000 to the City Railway. It was also agreed that in the division of profits 55 per cent of the net receipts shall go to the city and 45 to the companies. The companies are to be allowed 5 per cent interest on the money secured for reconstruction and 5 per cent brokerage on this money; also a 10 per cent contractor's profit on the work of reconstruction. During the three-year rehabilitation period 70 per cent of the gross receipts is to be set aside for operating expenses, the remainder of this amount, after payment of operating expenses, to be applied on renewals. After the rehabilitation period 6 per cent of the gross receipts is to be set aside for renewals. It was also decided to appoint Bion J. Arnold chief engineer of the board of supervising engineers, at a salary of \$30,000 a year. Although no contract has been signed it is understood that he will accept. The selection of Mr. Arnold to supervise the work of rehabilitation has met with unanimous approval, on account of his familiarity with the situation through his services as consulting engineer for the city throughout the entire process of the negotiations and because of the universal confidence in his integrity and his high professional standing.

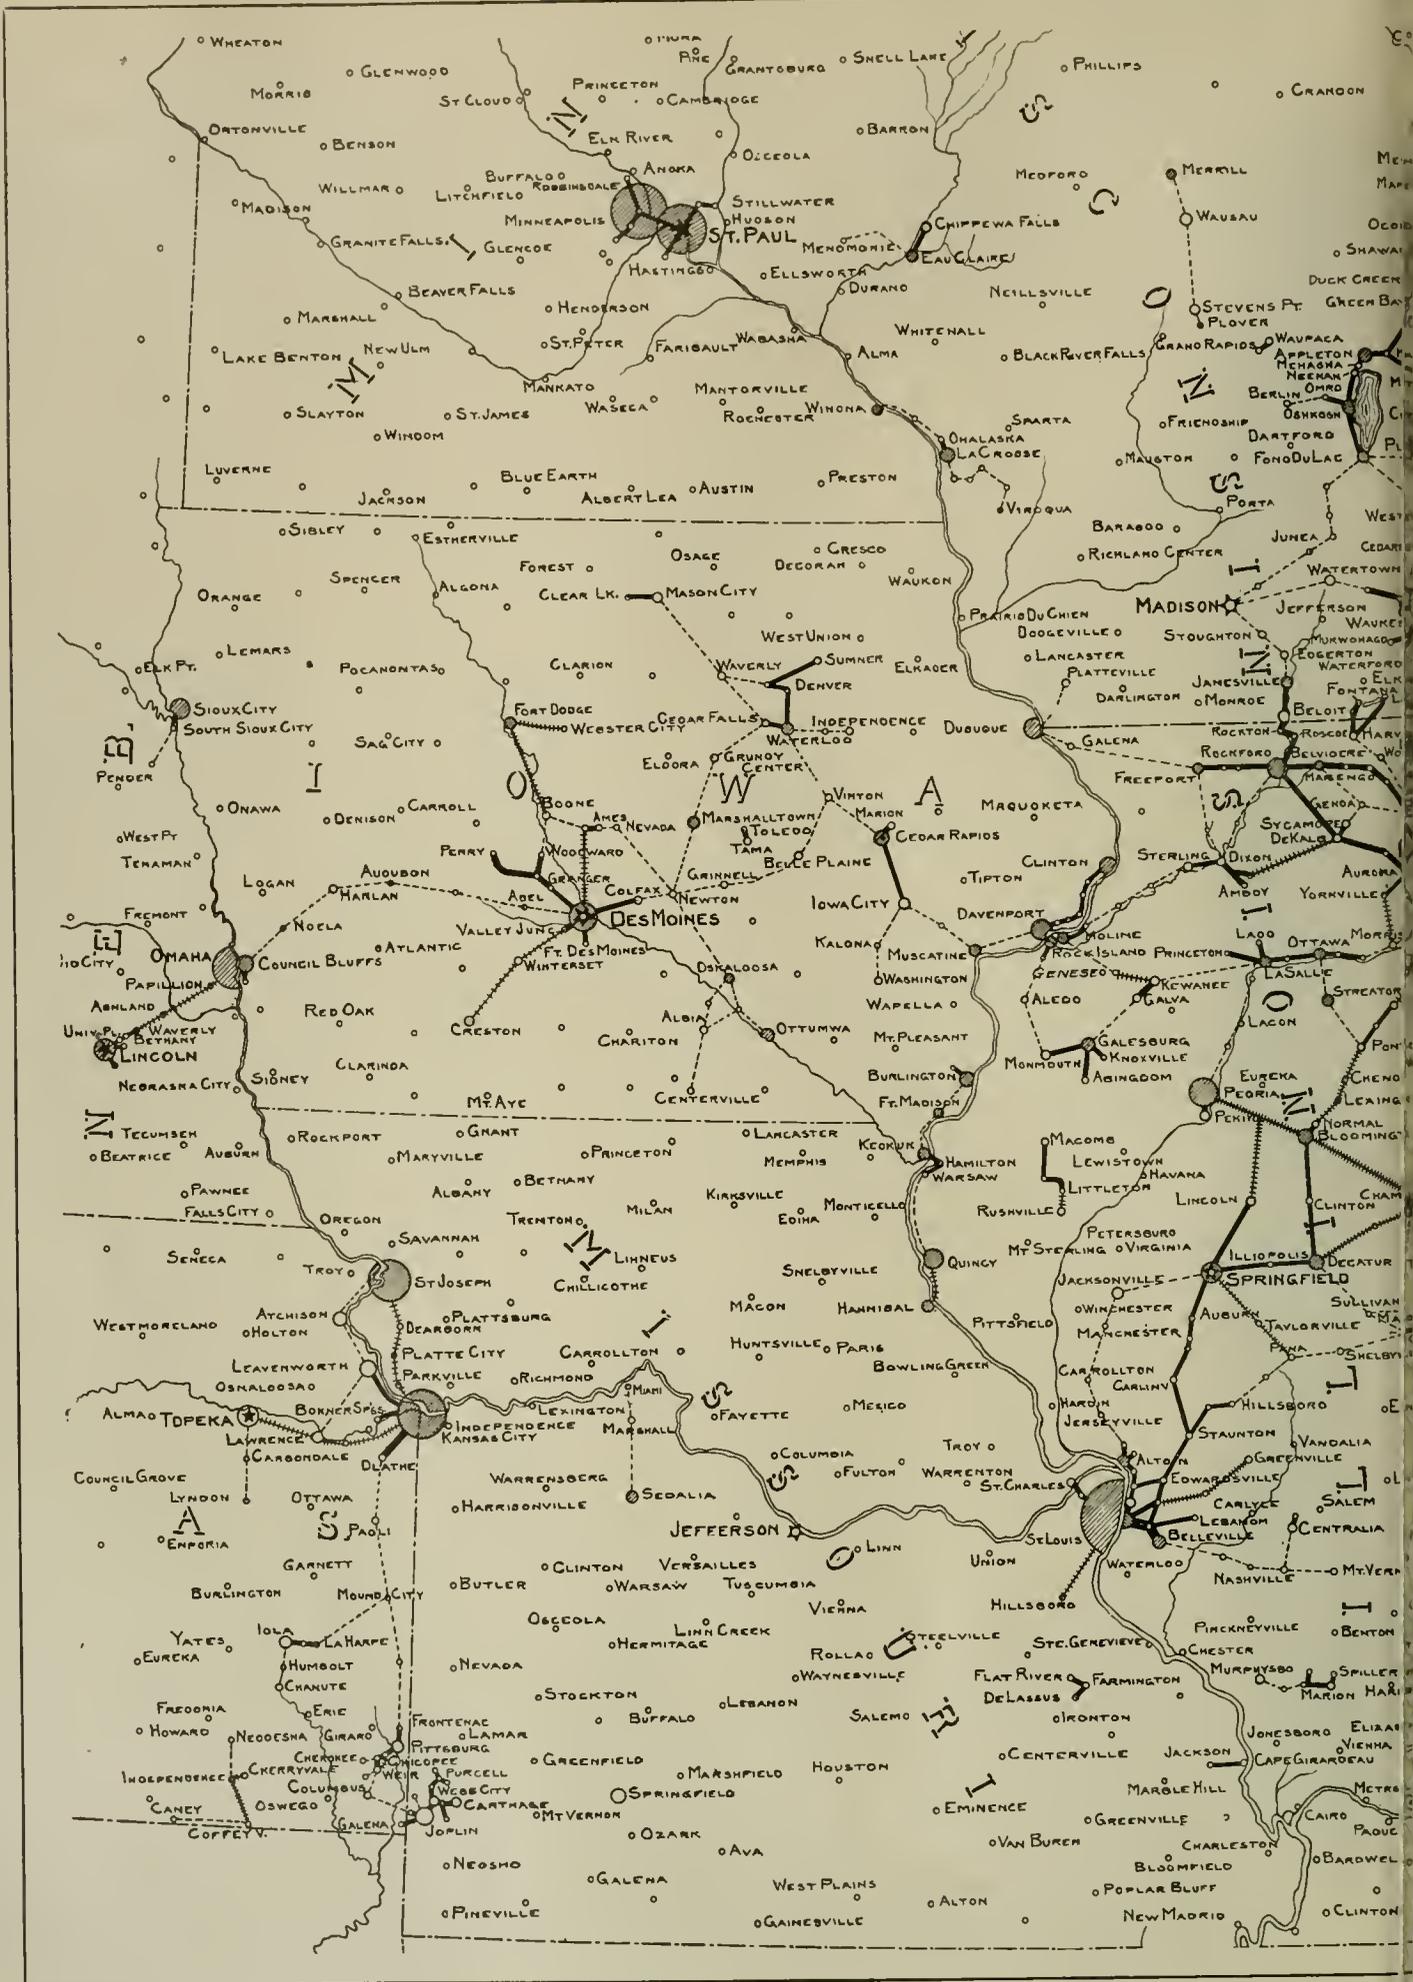

The situation in regard to the Union Traction ordinance is complicated by the internal financial relations between the company and its underlying companies. On December 19 John M. Harlan, representing Judge Grosscup, the referee in the Union Traction litigation, asked the local transportation committee to strike out the clause in the Chicago City

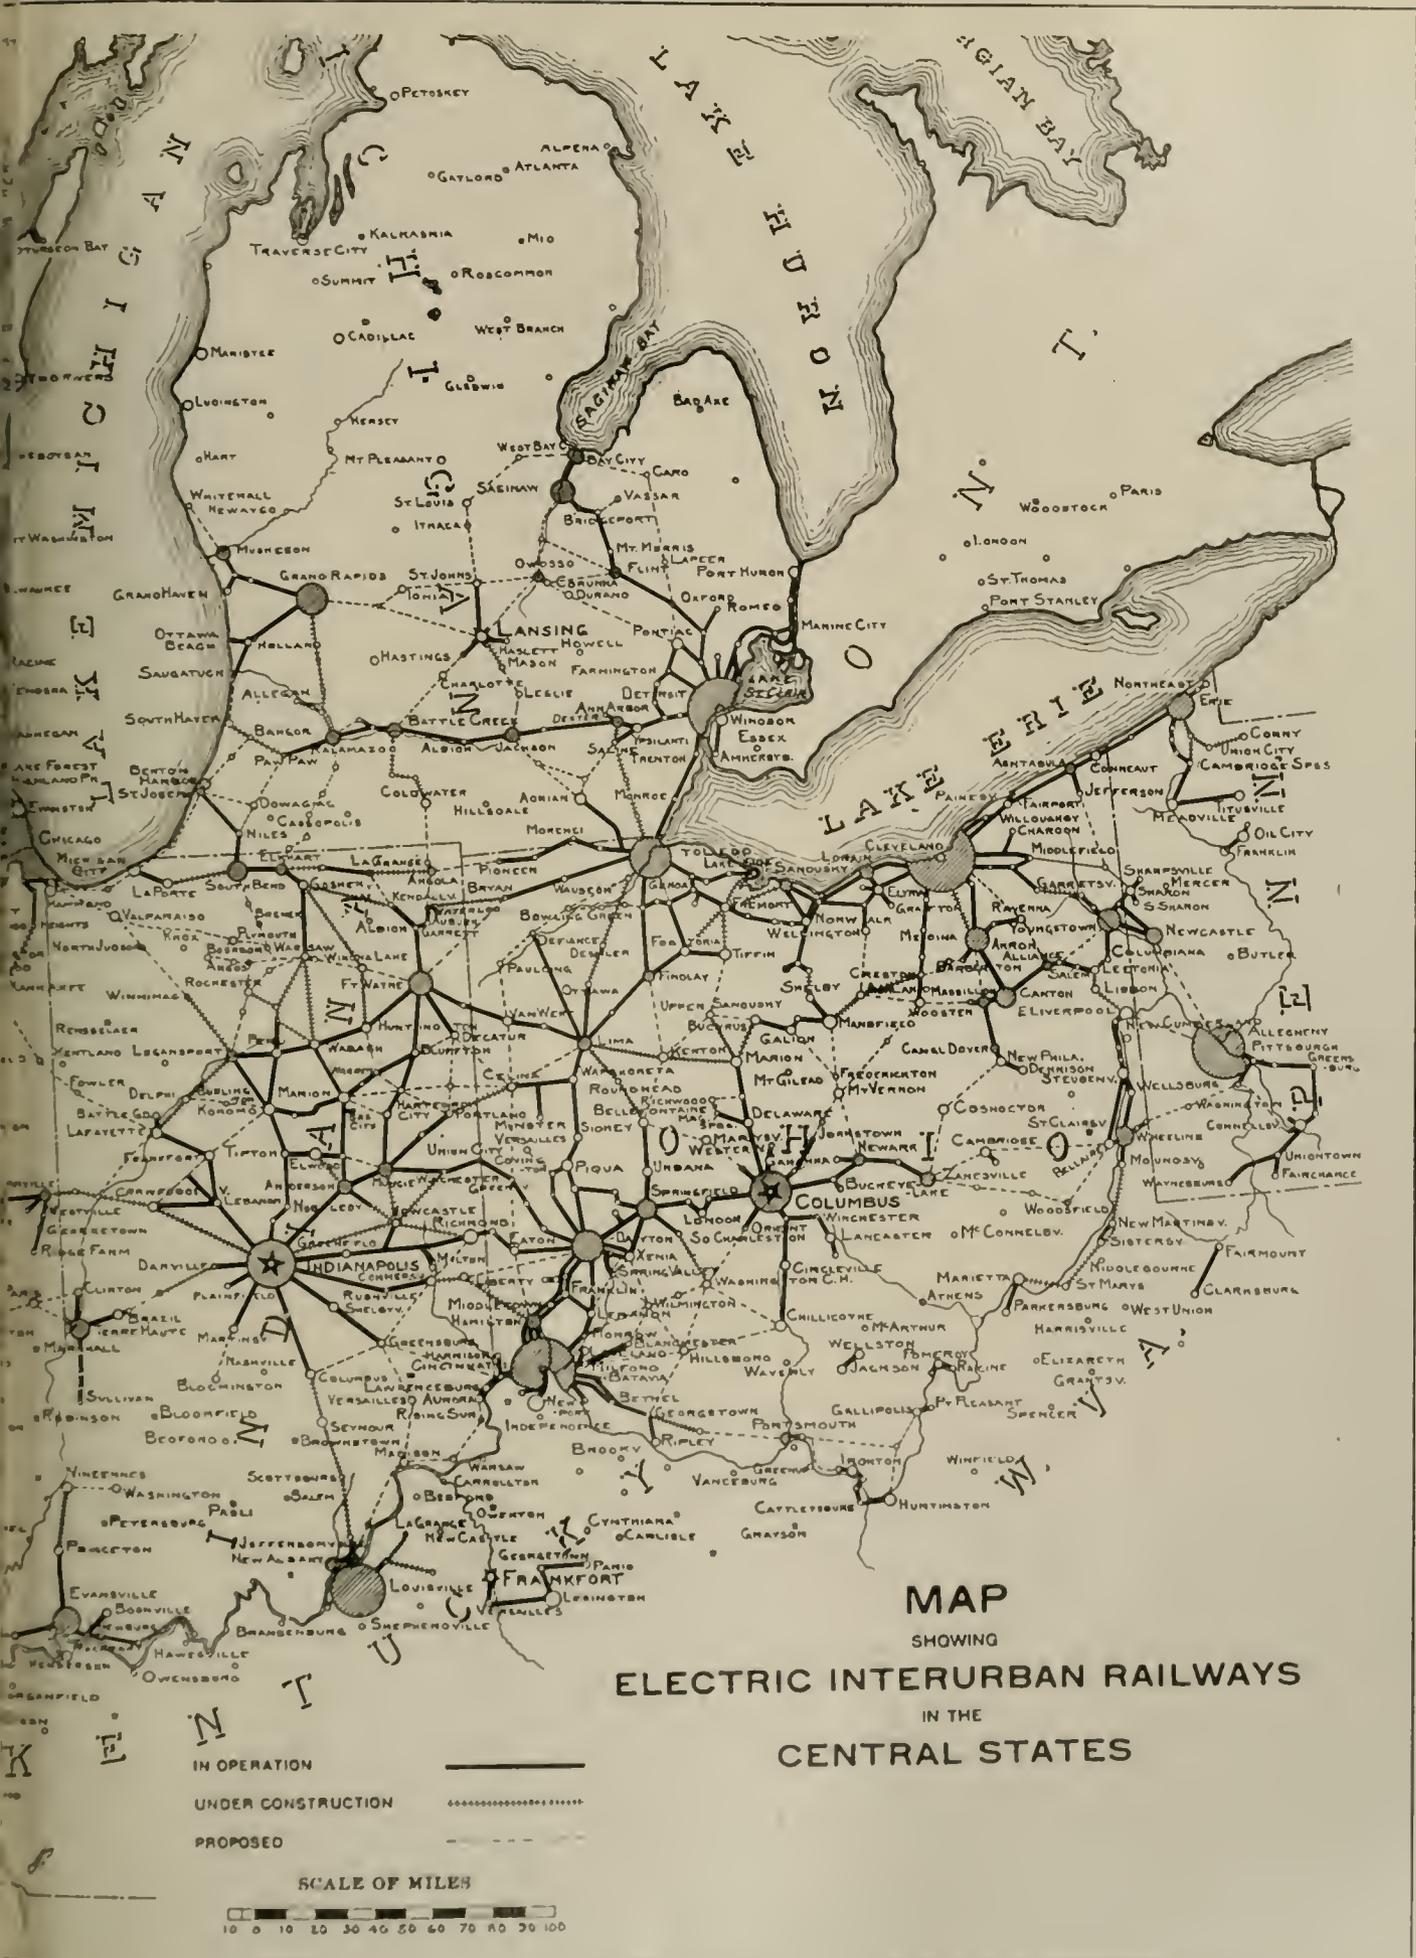

ordinance providing for the extension of that company to the north and west sides in the event of failure of the Union Traction Company to accept the ordinance, and to delay the settlement until the internal difficulties of the Union Traction could be removed and both ordinances be passed at once. Walter L. Fisher, city traction counsel, at once delivered an ultimatum that the Union Traction should get its affairs in such shape as to come to an immediate settlement or the City Railway would be empowered to take over its territory. The Union Traction Company replied that it would endeavor to come to an agreement at once and in no way delay the settlement.

While the Chicago newspapers and the people were congratulating themselves on the prospects of immediate settlement and consequent improved service, Mayor Dunne suddenly announced that he would insist on the ordinances being submitted to a referendum vote of the people at the April election before being submitted to the council. He stated that during his campaign for the mayoralty last spring he had repeatedly promised that all important measures relating to the traction situation should be submitted to the people for a decision, and that the city council had also put itself on record to the same effect. This unexpected announcement by the mayor met with an overwhelming protest from all quarters. In order to secure a referendum vote it is first necessary to secure a petition signed by a large number of names and in case such a petition could not be completed in time for the April election the whole matter would have to be postponed for another year or two. Civic bodies and merchants' leagues as well as individuals vied with each other in passing resolutions and writing protests to the newspapers, demanding an immediate settlement of almost any kind that would pave the way for a speedy elimination of the present intolerable service conditions. The Chicago Tribune even instituted a postal card ballot on the referendum question and the incomplete returns have shown a large majority in favor of immediate passage of the ordinance. A majority of the aldermen have also expressed themselves as opposed to any delay.

A meeting between the city's representatives and the eastern financiers controlling the Union Traction was held at Atlantic City last week and on his return to Chicago Walter L. Fisher announced that the main points had been settled. The company guaranteed to acquire a perfect title to the north and west side lines, to be delivered to the city in event of purchase, and that in the reorganization both minority and majority stockholders should be treated alike. The company also agreed to a single fare with universal transfers to the lines of the Consolidated Traction Company and to take care of the operating agreement with that company. It also agreed to build new tunnels at Washington and La Salle streets and to lower the Van Buren street tunnel. The ordinance is to run to the Chicago Railways Company, which is to reorganize the Union Traction, with Frederick H. Rawson at the head.

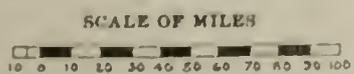

The City Railway ordinance was to have been reported on Wednesday night, but as it was being gone over for the last time by the committee in the afternoon, Attorney David K. Tone, representing the Chicago Federation of Labor and the Municipal Ownership League, appeared and attempted to show that the ordinance was full of flaws. He claimed that the City Railway under its charter could not extend to the Union Traction territory and that the charter could not be so amended; that the ordinance is practically a perpetual grant; that in the event of purchase at the end of 20 years the city or another company must pay for the value of the unexpired franchises at present, and that no company would be willing to pay such an exorbitant price. These, with various other objections, were all answered by Mr. Fisher and the mayor, but it was decided to hold the matter over another week.

MOTOR-OUT INDICATORS.

On a car equipped with four motors it frequently happens that from such causes as sticking brushes, broken connections in the armature or fields, etc., one of the motors gives out. While such failures will incapacitate a particular motor, this condition may not actually cripple the car, and in frequent cases the other motor of the pair may run for some time, perhaps all day, carrying double its regular load. In this way the operating motor may receive a strain and become damaged more or less in proportion to the length of time it is run with an idle mate. To provide against this condition and afford a continuous indication of the presence of current in motor leads, the "motor-

coil is connected with the A-2 binding post of the controller. Similar connections are made for the other coils in the indicator.

When the controller handle is moved and current is fed to the motors it first enters the solenoid and, the circuit being closed through the controller cable and motor, the indicator coil is magnetized, lifting the core to the center. As this core lifts, the pin in it lifts in turn the flap above, thus showing the word "In" which appears under the space normally covered by the flap. Thus the motorman knows that the particular motor circuit in series with this coil is in operative condition. If from any cause the circuit is open the coil will not act and the flap will remain at rest, showing the word "Out" on its face. The motormen are in-

Sketch Showing Detail Design of Motor-Out Indicator.

out indicator shown in detail by the accompanying illustration is used with four-motor equipments by the Denver City Tramway Company and is being placed on all of one class of cars owned by this company.

The active parts of the indicator are encased in a neat box of oak, 5 1/4 by 12 by 4 7/8 inches, outside dimension. This box has a glass top and is divided into two compartments; an upper one for the indicating flaps, which are similar to annunciator drops, and a lower one for housing the coils and delicate parts. As will be noted by reference to the illustration there are four coils or solenoids, one for each motor. These coils consist of about 30 turns of No. 4 wire wound in two layers on a brass tube 5/8 inch in diameter. Inside the brass tube is a movable iron core with a brass head and pin which, when at rest, is below the center of the coil. Each solenoid is directly in series with its respective motor. Lead A-1 is taken from the cable and connected with one side of the No. 1 coil, the A-1 binding post in the controller connecting with the other side of this coil; lead A-2 is run to coil 2 and the other terminal of this

constructed that when a flap fails to rise after two or three trials they should cut out the inoperative pair of motors, using the cut out switch in the controller box as usual.

This ingenious device for continuous inspection of motor equipments has been found to be a satisfactory supplement to the usual methods of inspection. The "motor-out" indicator boxes are placed at the back of and about flush with the tops of the controllers, so that they are constantly under the observation of the motorman.

High Voltage Third Rail Line in California.

The Central California Traction Company is building an interurban line from Stockton to Lodi, Cal., a distance of 15 miles, which will be operated by direct current delivered through an under-running third rail at a pressure of 1,200 volts. The General Electric Company is furnishing the electrical equipment and until the contract is completed in June, 1907, the line will be operated temporarily with 400 volt equipment. E. P. Hilborn, of Stockton, Cal., is general manager.

A NEW GOVERNOR ON NEW YORK PUBLIC UTILITIES.

In his inaugural message to the New York legislature Governor Hughes devotes considerable space to the matter of transportation interests and public service corporations in the state at large and in Greater New York. The following are extracts from the message:

Public Service Corporations.

Proper means for the regulation of the operations of railroad corporations should be supplied. For want of it, pernicious favoritism has been practiced. Secret rebates have been allowed, and there have been unjust discriminations in rates and in furnishing facilities for transportation. Those who have sought to monopolize trade have thus been enabled to crush competition and to grow in wealth and power by crowding out their rivals who have been deprived of access to markets upon equal terms.

These abuses are not to be tolerated. Congress has legislated upon the subject with reference to interstate commerce, where naturally the evil has been most prominent. But domestic commerce must be regulated by the state, and the state should exercise its power to secure impartial treatment to shippers and the maintenance of reasonable rates. There is also need of regulation and strict supervision to insure adequate service and due regard for the convenience and safety of the public. The most practicable way of attaining these ends is for the legislature to confer proper power upon a subordinate administrative body.

We have now a board of railroad commissioners of five members. It is charged specifically with important duties. The execution of mortgages and the increase or reduction of capital stock are subject to its approval, its certificate that public convenience and necessity require the construction of a projected railroad is required before construction can be begun, and it deals with changes in highway grade crossings and various other matters in a definite way.

The law also provides that the board "shall have general supervision of all railroads and shall examine the same and keep informed as to their condition and the manner in which they are operated for the security and accommodation of the public and their compliance with the provisions of their charters and of law." If in the judgment of the board it appears "that any change of the rates of fare for transporting freight or passengers or in the mode of operating the road or conducting its business is reasonable and expedient, in order to promote the security, convenience and accommodation of the public," it may after notice and hearing fix a time within which the changes shall be made.

But the action of the board in the exercise of this general power of supervision amounts to a recommendation. If its direction is not complied with, the law provides that the matter shall be presented to the attorney general for his consideration and action, and shall be reported to the legislature. So, if it appears that any railroad corporation has violated the law or unjustly discriminates in its charges, and the wrongful conduct is continued after notice, the matter is to be brought to the attention of the attorney general, "who shall take such proceedings thereon as may be necessary for the protection of the public interests."

The present scheme of regulation is inadequate. There is a lack of precision in the definition of the powers of the board and an absence of suitable means to compel compliance with its decisions. No penalties are provided for disobedience to orders of the board made within its proper authority. Nor is the board authorized to institute and conduct legal proceedings for the purpose of enforcing its requirements.

It is also provided that the expenses of the commission shall be borne by the railroad corporations upon the apportionment of the controller. This plan of reimbursing the state is wholly indefensible. The supervision of railroads is in the interest of all the people and should be borne by the people as any other expense of administration. Such a board should be established in public confidence as an independent governmental body receiving no support from the railroads save as they are duly taxed for the general support of the government.

We have also a commission of gas and electricity with broad powers with reference to corporations engaged in supplying gas and electric current.

New Railroad Commission with More Power.

It is my judgment that there is no need of two separate commissions to deal with these subjects. There are now corporations which are subject to the jurisdiction of both commissions, and in some cases the same questions are pre-

sented for the decision of both. Similar principles are applicable to the decision in many cases within the jurisdiction of each and harmony of administration would be promoted by having a single body. It is plainly in the interest of economic administration in order to avoid the unnecessary multiplication of officers and clerical force that there should be but one commission. In the two boards we have now eight commissioners. A board of less than this number would answer both purposes.

I therefore recommend that the present board of railroad commissioners and the commission of gas and electricity be abolished and that a new commission be constituted, with powers of regulation and supervision, within constitutional limits, of the corporations now subject to the existing commissions. The commission should have all the powers possessed by the present commissions and such additional powers as may be needed to insure proper management and operation. Its powers should be clearly defined and should embrace the power to act upon its own initiative as well as upon complaint; to pass upon the issue of stocks and bonds; to examine properties, books, and accounts; to require detailed reports in prescribed form; to prescribe reasonable rates; to require adequate and impartial service; to provide for the safety of employes and for the protection of the public, and generally to direct whatever may be necessary or proper to safeguard the public interests and to secure the fulfillment of the public obligations of the corporations under its supervision. Provision should be made for suitable inspection so that the commission may be advised as to all matters within its purview and be in a position to take action on behalf of the people without the formal institution of proceedings by complainants. A prescribed quorum should be entitled to decide all questions, and any one commissioner should be empowered to make examinations and investigations, and the proceedings and decisions of one, when approved by the board, should stand as its proceedings and decisions.

The corporation guilty of disobedience to its orders, and all officers and other persons responsible for such disobedience, should be visited with appropriate penalties. The commission should also be entitled to institute legal proceedings for the enforcement of its orders, and all such proceedings should be expedited by suitable preference in all the courts of the state. The legislature should thus provide, within its constitutional power, adequate means for the entirely just and impartial regulation of these important public enterprises.

Reform in Transit Conditions Here.

The problem of transportation in the territory of Greater New York demands special, prompt, and comprehensive treatment. The configuration of Manhattan Island and the concentration of business at its lower end, together with the rapid growth of population, have produced an extraordinary congestion. All the existing lines—surface, elevated, and subway—are overburdened, and the people suffer in mind, body, and estate. The worst congestion is found at the Brooklyn bridge, due to the convergence at that point of the Brooklyn traffic. The people of Brooklyn who do business in Manhattan are subjected morning and night not only to exasperating inconvenience, but to such maltreatment and indignities incident to their disgraceful herding that relief in the most practicable manner should be afforded them at the earliest possible moment.

Not only are new facilities needed, which should be planned with reference both to immediate and future needs, but there is urgent necessity for more strict supervision to secure better service on existing lines. In some portions of the city antiquated horse cars may still be seen, giving picturesque emphasis to the disregard of the public convenience. Overcapitalization and the improvident creation of guaranties and fixed charges to suit the exigencies of successive combinations entered into for the purpose of monopolizing the traffic have produced their natural results. There are such unjust burdens upon earnings and the tendency constantly to effect economies at the expense of proper service is so strong that it is imperative that the people shall have vigilant representatives clothed with ample authority to compel the corporations to perform their public duty.

In 1891 the legislature, for the purpose of providing for the development of additional transit facilities, passed the so-called Rapid Transit act. It constituted a board of rapid transit commissioners, who were named in the statute. Numerous amendments have been made and additional powers conferred. The statute contains important provisions with reference to construction by the city. Through the accretions of years it has become cumbersome and extremely complicated. It needs revision. Pursuant to the provisions

of this act the present subways have been constructed and plans have been made for further construction. By a recent amendment the board is authorized, with the consent of the board of estimate and apportionment of the city, to grant rights and franchises and to make contracts with reference to the construction and operation of the parts within the city of inter-state trunk lines.

Would Abolish Rapid Transit Board.

We have thus in the city of New York an anomalous condition. Two boards created by the legislature are exercising powers of the greatest importance with reference to transportation. The board of rapid transit commissioners is dealing with the question of new facilities and is empowered to make contracts for construction and operation. It is also dealing with the question of the construction of trunk lines into or across the city. The state board of railroad commissioners has general jurisdiction over the railroads of the state, and has supervisory powers over the surface lines and the elevated roads in the city. It does not exercise jurisdiction over the subways, as these were constructed under the rapid transit act. But while the powers of supervision are divided, the interests in control of the surface, elevated, and subway lines are now united in a single corporation.

This situation should be met by a comprehensive plan. All the operations of railroad companies in the territory of greater New York should be under the supervision of one board. And the board that is to have the power to supervise generally these operations should have the power of initiating plans and of making contracts for the construction and operation of new lines. Instead of two boards dealing with different phases of the same problem, there should be one board empowered to deal with it in its entirety. As such a board would exercise important state powers of control and regulation, it should be a state board, and should be composed of men familiar with conditions in the territory affected. In my judgment it would not be advisable to put all these matters under the control either of the present board of railroad commissioners or of the new commission which I have proposed to take its place. The urgent need of an increase in transportation facilities, and the unique conditions existing in Greater New York, justify the creation of a separate board to deal with the entire matter of transportation in that part of the state.

I recommend that the board of rapid transit commissioners be abolished and that a new board be created, to have all the powers now exercised by the rapid transit board, and also to have powers with reference to operations within the territory of greater New York—or if deemed advisable, within a wider district embracing the adjoining counties into which certain lines of the surface railroads extend—similar to the powers which I have suggested should be conferred upon the new commission for the rest of the state. There would thus be included the regulation of gas and electric corporations. Provision should be made for the retention by the board of estimate and apportionment of the city, of all the powers, including powers of approval, which it now enjoys.

The commission proposed for the state generally should have jurisdiction over all traffic between points within the city of New York and points elsewhere in the state. It is believed that in this manner the whole question of transportation, and of gas and electric service in the territory of greater New York can be dealt with in an intelligent and efficient manner, and that to the fullest extent possible the just requirements of that great community may be satisfied.

Airbrakes Versus Handbrakes.

The average difference in the cost of operating an electric car furnished with handbrakes and one equipped with airbrakes, on roads running through large cities where frequent stops are necessary, has been proven by actual tests with Christensen brakes to be between 10 and 15 per cent. These figures, furnished by the manufacturer, are based upon current consumption. The saving in current by the use of the airbrake is due to the fact that the powerful and instantaneous action of the brake renders it possible to leave the brakeshoe clear of the wheel, even when newly adjusted, and allow the motorman to run in "full release," except when he has occasion to stop or check the car; whereas, with the handbrake the shoes must not only be adjusted tight, but within city limits the motorman must keep the brake dragging, in order that he may stop quickly enough to avoid collisions. It is evident that, in addition to the economy of power, there is also a large saving in brakeshoes and labor incidental to their adjustment.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B.

PRESUMPTION OF NEGLIGENCE FROM FALLING OF TROLLEY POLE UPON PERSON WAITING TO BOARD CAR.

Cincinnati Traction Co. v. Holzenkamp (Ohio), 78 N. E. Rep. 529. June 26, 1906.

Proof of the falling of a trolley pole from an electric car, when it stopped at a usual stopping place, upon a person standing there for the purpose of getting upon the car, the supreme court of Ohio holds raises the presumption of negligence on the part of the traction company, and, unless rebutted, the party injured is entitled to recover damages.

DUTY OF CONDUCTOR TO SEE THAT PASSENGER HAS REASONABLY SAFE SEAT OR TO CONTROL RUNNING OF CAR ACCORDING TO DANGER TO ONE INSECURELY SEATED.

Van Horn v. St. Louis Transit Co. (Mo.), 95 S. W. Rep. 326. June 19, 1906.

While the upright stanchion to which the pivot was fastened upon which the back of a seat in an open summer car turned would be on the outside of, and afford protection to, a passenger occupying an ordinary position on the end of the seat, there was evidence in this case that a woman, owing to the cramped half-sitting position she occupied from the seat not being large enough to accommodate six occupants or two of them appropriating a larger share of the seat than necessary, had not the advantage of the protection afforded by the stanchion, but was compelled to sit with her back thereto, with nothing on the outside to protect her or prevent her falling off. The supreme court of Missouri, division No. 2, says that it was the conductor's duty to see that she had a seat reasonably safe and secure, and knowing, as he must have known, her position to be unsafe, it was his duty to control the running of the car with a degree of care proportioned to the danger to which she was exposed by reason of her insecure position on the seat.

FACTS AND RULES DEEMED ESTABLISHED IN CONNECTION WITH OPERATION OF ELECTRIC STREET RAILWAYS AS TO FARES, TRANSFERS AND DUTIES OF CONDUCTORS—RULE REQUIRING EXPULSION FOR REFUSAL TO PAY FARE OR PRODUCE PROPER TICKET IS REASONABLE—TRANSFER TICKET CONCLUSIVE—REMEDY OF PASSENGER GIVEN WRONG TICKET—DAMAGES RECOVERABLE FOR ATTEMPTED EXPULSION.

Norton v. Consolidated Railway Co. (Conn.), 63 Atl. Rep. 1087. June 5, 1906.

There are certain facts and established rules connected with the operation of electric street railways, which in these days are familiar to every person of ordinary intelligence who has occasion to ride on them, and which, the supreme court of errors of Connecticut says, are to be regarded in determining what the real contract of carriage is in a case like the present one—an action to recover damages for the alleged tort of the defendant's servant in attempting to forcibly eject the plaintiff from the car after he had produced an improper transfer ticket and refused to pay fare. Among them are, that the mere payment of the ordinary fare in a street car does not, of itself, as upon a steam railroad, indicate the destination of the passenger, nor suggest that he desires transportation by another line and upon another car; that a passenger upon one line desiring to be transferred to another, operated by the same company, must pay his cash fare on the first car; that upon such payment he will be carried, in that car, to the point of transfer to the second line, that before leaving the first car he must obtain from the conductor of it a ticket indicating upon its face his right to take passage upon a car of the second line; that as to the conductor on the second car, the person receiving such transfer ticket enters that car

like all other passengers taking the car at that point, and will not be permitted to ride unless he either pays his fare or presents a proper transfer; that it is the office of the conductor of the second car to determine the right of the passenger to ride upon that car, and that upon the presentation of a transfer ticket, the ticket itself is the only evidence of such right which the conductor can properly accept.

A rule requiring the expulsion from a car of a passenger who refuses either to pay his fare or produce a ticket showing his right to ride on such car is a reasonable one. In ascertaining whether the plaintiff was entitled to ride on the second car, it was not the duty of the conductor of that car to accept the statement made to him by the plaintiff that the mistake in his transfer was the fault of the conductor of the first car. As between the second conductor and the plaintiff, the transfer ticket was conclusive as to the latter's right to be carried as a transferred passenger upon his car.

In the court's opinion, the facts showed that the real contract of the defendant was to carry the plaintiff, upon the first car, to the proper point of transfer to the second line; to furnish him a proper transfer ticket to entitle him to a passage on a car of the second line; and to carry him upon that line, upon the presentment of such transfer or the payment of his fare to the conductor of the second car. Through the carelessness of its servant, in not giving the plaintiff the transfer ticket which he asked for, the defendant failed to perform its contract. For such breach of contract the plaintiff would have been entitled to compensation for the loss or injury, had there been any, which necessarily followed from the defendant's failure to furnish him a proper transfer ticket. His remedy for such breach of contract was not to refuse to pay his fare, and to forcibly resist being expelled from the car. As the transfer ticket which he presented did not even purport to authorize him to ride on a car of the line he boarded, the conductor of that car, notwithstanding his explanation of the mistake, was justified in refusing to accept it, and in requiring him to pay his fare or leave the car, and after the demands made by the conductor, it became the plaintiff's duty to either pay his fare or peaceably leave the car.

The court's conclusion is that the plaintiff, having by his own wrongful conduct invited the use of force, could not complain of the use by the defendant of reasonable force in the attempt to remove him from the car. It was error to hold that he was entitled to substantial damages, and the case was remanded for the assessment of nominal damages.

ANY TRACTION COMPANY AUTHORIZED BY STATUTE TO TAKE ANY EXISTING STREET RAILWAY WITH CONSENT OF OWNER, LESSEE, OR OPERATOR, AND OPERATE IT WITHOUT REGARD TO WHETHER ITS PREDECESSOR WAS CLOTHED WITH POWERS AND FRANCHISES—POWERS OF COMPANY AFTER EXPIRATION OF TERM LIMITED IN ITS CHARTER.

Mayor, etc., of Jersey City v. North Jersey Street Railway Co. (N. J. Sup.), 63 Atl. Rep. 906. June 11, 1906.

By the first section of the New Jersey act to authorize the formation of traction companies passed in 1893, it is enacted that any company incorporated under it "shall have power to enter upon any street or highway upon which any street railway or other railway operated as a street railway, is now or may hereafter be constructed (with the consent of the owner or owners, lessee or lessees of such railway, or of the person or persons operating the same), and * * * maintain and operate such railway." The second section declares that every company incorporated under the act shall have, in addition to numerous powers, privileges, and

franchises therein specified, "all other powers necessary to the performance of its duties and the exercise of its privileges imposed or conferred by this act."

When it is remembered that the primary object in incorporating street railway companies is, not the financial benefit to be obtained by their incorporators and their successors from the operation of the railways constructed by them, but the furnishing to the public of a cheap and easy means of intramural transportation, the purpose of those provisions of the act of 1893 which have been referred to, the supreme court of New Jersey says, seems apparent; and that is to prevent, as far as possible, the people from being deprived of the benefit which comes to them from the use of these public utilities, by the financial or other inability of the owners or operators of them to continue their operation.

The statute, the court continues, does not contemplate that the right of a corporation, organized under it, to maintain and operate a street railway shall depend upon the existence or nonexistence of such right in its predecessor in ownership or possession. It deals not only with railways which are owned and operated by corporations de jure (of right), having powers and franchises which are efficient to enable them to operate their roads, but with railways which are owned or operated by corporations which never had a de jure existence, and by those whose right to the enjoyment of the powers and franchises originally bestowed upon them has been terminated by efflux of time or otherwise. It deals with the railway as an existing thing, rather than with the question of the rights and powers of the corporation having possession of it. It authorizes a traction company organized under it to take possession of any existing street railway, or railway operated as a street railway, provided it obtains the consent of the party who owns, leases or operates it, and it confers upon such traction company all the powers and franchises necessary for the proper maintenance and operation of the railway after it has acquired its possession, without regard to whether or not its predecessor was clothed with powers and franchises. In a word all that a traction company organized under the act of 1893 needs to acquire from its predecessor, whether that predecessor operates the railway as owner, or as lessee, or by bare right of possession, is its consent. Its power to maintain and operate the railway is derived, not from its predecessor, but from the statute itself.

The expiration of the term limited in its charter, the court further says, did not absolutely destroy the corporate existence of the Jersey City & Bergen Railroad Co. That still remained to it by express statutory provision for the purpose of enabling it to settle and close its affairs and to dispose of and convey its property. At the time when it leased its railway to the Consolidated Traction Co., therefore, it had power to consent that the latter company should take possession of its railway and maintain and operate it. Its assignment to the Consolidated Traction Co. of the powers, privileges, and franchises which had been conferred upon it by the legislature was not requisite to enable the latter company [incorporated under the act of 1893] to maintain and operate the railway; and the fact that the assignment was fruitless, because such powers, privileges, and franchises had already ceased to exist, could not, of course, deprive the latter company of its powers, privileges, and franchises, conferred upon it by direct legislative grant. When the Consolidated Traction Co. acquired possession of the railway, therefore, it was clothed with full power to maintain and operate it; and when it, in turn, leased the railway to the defendant's company, that company, which was also incorporated under the traction act of 1893, was clothed with like power by direct grant from the legislature.

PIPING AND POWER STATION SYSTEMS—XXV.

BY W. L. MORRIS, M. E.

Figure 234-(H5-1) shows a very satisfactory construction with pipe connections entirely outside of the frame, thus avoiding the possibility of their being strained against the frame of the engine. As shown they are also exposed to view which is advantageous in case of leaks. The water can be diverted over the surface of the journal either by means of dividing partitions cast in the journal or by a pipe run into the journal and forming one of the connections. The regulating valve should be on the inlet branch, the outlet being free to atmosphere and discharging into a funnel that may readily be seen and tested by the operator. To allow the greatest possible flexibility the supports for the piping should be well away from the journal. The discharge

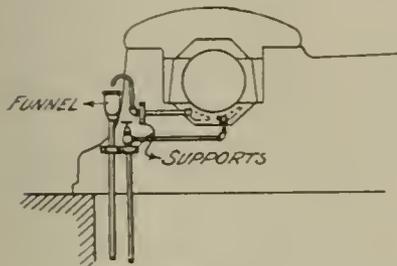

Figure 234—(H5-1).

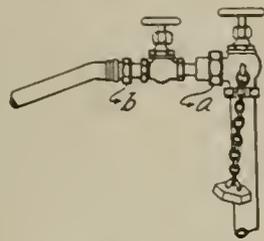

Figure 235—(H8-1).

should be carried to a height slightly above the journal, thus insuring that the bearing will at all times be full of water.

It may appear that the funnel, exposed pipe, etc., as shown are crude and unsightly, but it should be remembered that the first consideration is utility and the latter, appearance. That which on its face shows usefulness and convenience if neatly constructed has every reason for being left exposed.

Low-Pressure Water to Dry-Vacuum Pump.

For continuous running it is absolutely necessary to cool the air cylinder of the dry-vacuum pump. Low-pressure water is used for this purpose. The temperature of the air pumped is generally about 120 degrees F., and if no air cooler is used and air is compressed from about 2 pounds absolute to 15 pounds it is thus reduced to about 1-7 of its former volume. The dry-vacuum pump will operate under rather high temperatures, thus permitting cooling water to be discharged at a temperature as high as 175 degrees F. The arrangement of pipes for cooling the journal, as shown in Figure 234, is also suitable for cooling an air-pump cylinder, using only the inlet valve to control the water and an open funnel to observe the quantity and temperature. The amount of cooling water necessary to reduce the temperature of the air cylinder of the dry-vacuum pump is quite small, being only about 1.5 per cent of that used for boiler feeding. The amount of water so used should be determined by observation of the condition of the pump at various temperatures of the cooling water.

One of the most frequent troubles with air cylinders is brought about by the admitting of oil to the cylinder, which, due to the high temperature, becomes burned onto the air-discharge valve.

Low-Pressure Water to Pump Priming Pipes.

A low-pressure water connection is always provided for priming fire pumps. This connection is not installed because such pumps are not capable of lifting water without priming, but because the pump priming pipes connected with the low-pressure water main enable the fire pump to discharge water and be in service for full duty in the least possible time. As the saving in time in priming feed and

ordinary service pumps is not as essential as with fire pumps they are seldom equipped with priming pipes. The piping arrangement shown in Figure 216-(F1-3) will be found satisfactory for the service pump. A fire pump should have a foot valve, also a priming connection between the suction and discharge valves at both ends of the pump and should also have priming connections to the suction line. By the use of these several details air may be removed from the pump before it is started. If priming water is not easily obtainable from a low-pressure line or from the pump discharge as shown in Figure 216, then a hose valve should be attached to the pump between the suction and discharge valves at all four ends of a double-acting pump. This detail can be satisfactorily arranged by connecting the four ends with piping and using check valves that open into the ends of the cylinders and a stop valve to control the water from the hose or pipe line.

If the fire pump has a foot valve it can easily be primed by delivering the priming water into the pump suction. This may put a part of the water ends into service and leave one or more ends out of service, which difficulty may often be observed with pumps that have been in operation for some time. The presence of water at the suction valve does not aid the end of the pump out of operation in taking its water. To enable the inoperative end to take water it is necessary to reduce the pressure in this end as far below the atmospheric point as the pressure on the water in the suction at the suction valve. This can only be accomplished by discharging to atmosphere the confined air, since the pump is able to discharge only a part of its air into the discharge pipe.

The usual method of freeing a pump of air is to close the valves in the discharge and open the vent over the discharge pump valve, thus allowing the contents of the cylinder to be discharged to atmosphere at a low pressure. All the air can in this way be discharged from the pump if the priming water is admitted between the suction and the discharge valves. Such an arrangement of valves requires a large air vent, and if a check valve is placed in the discharge line from the pump it will prevent the pressure coming back on the pump valve whenever the air relief is open.

The usual boiler-room operator is not sufficiently skilled to handle these priming arrangements unless they are quite simple. To free a pump of air when it is not fitted with priming pipes requires even more skill. Any operator should quickly learn to open the air vent and admit priming water if that is all that is required. It must not be inferred that priming pipes are mere conveniences, since there are many installations in which they are absolutely essential and with which if priming pipes were not supplied it would be necessary when priming to open the pump and fill it with water by using a hose, pail or similarly crude method, before the pump could be put into operation.

The use of priming connections with centrifugal pumps is indispensable, as has been explained under Class C-(F1). Generally speaking, the priming line to a pump has a diameter of about $\frac{1}{8}$ that of the pump suction.

Low-Pressure Water to Hose Connections.

There are generally three distinct hose systems for a power plant, but oftentimes one of these systems is made to serve for another. They are the fire service, the sprinkling and the regular low-pressure service as used for wetting down ashes, washing floors, etc. For the purpose of simplifying piping arrangements these three services should be divided into two systems that may, with safety and without causing serious difficulty, be changed from low to high pressure systems. Ordinarily one system should supply all the hose connections. The other system should be designed without by-passes or other means by which high pressure could be put on it. The only hose connections that

should take their supply from the low-pressure system should be those for wetting down ashes. This class of work is better served by using water under low head, thus avoiding the dust and spattering that would be caused by water of high velocity striking the ashes. As this advantage is too slight to call for a separate pipe line for wetting down ashes it will be advisable, if the fire line passes near the boiler front, to connect with it the hose for this service, controlling the pressure by valves at the hose connections.

If the low-pressure system is supplied from a tank there should be only such connections taken off this system as would be injured by high pressure, but to avoid running special lines and thus complicating the station pipe work it may be found advisable to make occasional hose connections with the high-pressure line. This method is particularly advantageous if these connections can be left unused during such times as the tank supply is limited, which would be occasioned when the pumps were temporarily used for some other service. Hose connections for floor washing would form one of these exceptions, but such work can be postponed until water is available.

A simple arrangement for floor washing is to use a small hose with a large coupling at the end for attaching to the fire connection. To avoid cutting the regular fire-service valves it is quite necessary that a separate valve for controlling the water should be attached to the regular hose valve. If a hose coupling of large size can be tapped out of the fire line and a nipple attached as shown by, a, in Figure 235-(H3-1) a very convenient connection is had. An alternate method would be had by screwing a small valve onto the larger valve and connecting the hose with the coupling, b.

Low-Pressure Water to Oil Filter and Tanks.

Low-pressure water service for washing purposes supplied with hand control is usually provided for the oil filter and tanks. A very satisfactory piping arrangement is had by running steam and low-pressure water pipes to an "ejector-T," having a valve in each line and a means for connecting the hose to the T. With such connections water can be supplied either hot for cleaning tanks or cold, as may be desired for general use. If water is required in any tank it can be supplied by hose or, in the case of precipitating gravity tanks, it may be admitted through pipe connections. Ordinarily the water required for this service does not exceed that which may be delivered through a ½-inch pipe.

Low-Pressure Water to Grease Extractor.

Only a small amount of water is required for grease extractors, the quantity being just sufficient to keep the baffle plate wet and amounting to about 5 per cent of the steam passing through the extractor. A water connection is essential for the successful operation of even the most efficient grease extractors. The water admitted to the separator is discharged together with the condensation, grease, etc., to an entrainer. This entrainer, for a vacuum separator, is designed to receive first, drips under vacuum, then, by a tilting mechanism to close the drip opening and open a steam connection so that the accumulated drips are blown out; it then closes the steam and opens the drip connections in turn, working in a manner somewhat similar to the action of a steam trap.

If the grease extractor is in series with the vacuum line to the condenser the spray water, even though lifting is necessary, may be taken from the condenser circulating water. This supply will be found somewhat more reliable than the low-pressure main and no pumping machinery will be required to insure its continuous operation. If the grease extractor forms a part of an atmospheric exhaust line it will be necessary to supply the spray water under a head greater than the exhaust pressure. In this case the drips

would be discharged through a steam trap or a U-shaped drip loop.

Low-Pressure Water to Cooling Boxes at Furnaces.

There are some makes of furnaces that require water cooling to prevent them from being burned. Such devices waste the heat taken up by the water, when it is discharged to the sewer, and they are a source of constant trouble. The manufacturers of station equipments call into use many methods for eliminating this troublesome detail. The reason for this choice is not that they can secure better results, but with a view to avoiding the serious loss and any interruption of operation that would be caused by a failure of the water supply. The customary method of regulating the supply to such devices is by maintaining full water pressure on the parts to be cooled and controlling the water with a discharge valve. If the heat in the furnace increases it is possible to generate steam and drive the water out of the water box unless the discharge opening be increased before the temperature is raised to the steaming point. Thus in the operation of such cooling systems the water must be wasted or a risk run of damaging the water box. By admitting water into a box which has attained a high temperature and driven out the water or in some other manner been without water for a short time, there is not only the danger of burning the water box, but a still greater one of cracking it. As a proof that much greater damage is caused by cracking than by burning many of the builders of this class of apparatus are now making water boxes of riveted boiler plate.

If a considerable supply of water is connected to a water box so arranged that the water can circulate in it relief will be had from much of the danger occasioned by interrupted water supply. The water in the tank, in case of approaching trouble, would become overheated and give a warning. A tank for this purpose, to permit of circulating water being at not less than 210 degrees in temperature, should be placed as high as possible. When the heater used is of the open type and the tank is placed at a high level the overflow may be discharged to the heater.

(To be continued.)

Chicago & Oak Park Elevated Switching Car.

Mr. Amos Sillers, master mechanic of the Chicago & Oak Park Elevated Railroad, has recently had built in the company's repair shops at Fortieth and Lake streets, Chicago, a very simple and efficient switching car, which in addition to performing a general switching service on the elevated lines and around the yards and shops is occasionally used as a work car. It consists of an ordinary 46-foot flat car body mounted on two Baldwin trucks of the type used on the company's passenger equipment, and reinforced with steel rails laid lengthwise and bolted to the floor sills.

At the rear end of the car is a motorman's cab occupying a floor space about 8 feet square and 8 feet 3 inches high. The cab has windows on all four sides, giving the motorman a clear view in all direction, and contains two controllers, one on each side. The rear truck is equipped with two G.E.-85 motors of 160-horsepower capacity each. The car is equipped with airbrakes and with both third-rail shoes and trolley, as the road has several miles of surface lines operated by trolley.

The Street Railway Young Men's Christian Association of Memphis, Tenn., has been in existence about a year and now has a membership of 386, equally divided between motormen and conductors. The average daily attendance at the well-equipped rooms in the car barns is 280. The association is contemplating fitting up a restaurant for the use of its members. One of the interesting features of the year, which drew an attendance of 600, was a home-talent entertainment at one of the railway company's park theaters.

News of the Week

Kokomo Marion & Western Discontinues Passes.—T. C. McReynolds, general manager of the Kokomo Marion & Western Traction Company, has announced that after January 1 free transportation will be issued only to employes.

American Street & Interurban Railway Association Proceedings.—Secretary B. V. Swenson has announced that it is expected to have the annual proceedings of the association printed and ready for distribution some time in January.

Interurban Station at Columbus.—The Indiana Columbus & Eastern Traction Company has purchased property on East Rich street in Columbus, O., which is to be ultimately used for the erection of an interurban station. The plans have not yet been completed.

West Chester Street Railway Abolishes Passes.—The West Chester Street Railway Company, of West Chester, Pa., has announced that beginning with the new year, it will issue no more free transportation, giving as a reason that the pass system is a burden on the company.

Executive Meeting Engineering Association.—President H. H. Adams of the American Street and Interurban Railway Engineering Association has called for a meeting of the executive committee to be held at the Manhattan Hotel, New York, on January 7, to consider the future work of the association.

Columbus Delaware & Marion Railway to Handle Express.—The Columbus Delaware & Marion Railway, which operates an interurban line from Columbus to Marion, O., has made a contract with the Wells-Fargo Express Company to handle its express business between those points. The express will be carried on combination cars during the day and a special express car will be run during the evening.

Quarterly Meeting New York Association.—The regular quarterly meeting of the Street Railway Association of the State of New York will be held at the Iroquois hotel, Buffalo, N. Y., at 10 a. m., on January 11. The subject of the meeting will be "Track and Roadway," and it is anticipated that several interesting papers will be read. Further notice of the meeting, giving the subjects of the papers, will be sent out later by the secretary, J. H. Pardee, Canandaigua, N. Y.

American Society of Mechanical Engineers.—At the annual meeting of the American Society of Mechanical Engineers, held in New York last month, the following officers were elected for the ensuing year: President, E. R. Hutton, of New York; vice-presidents, P. W. Gates, Chicago; Alexander Dow, Detroit; Walter M. McFarland, Washington, D. C.; Walter Laidlaw, Cincinnati; Frank G. Tallman, Cleveland; Frederick M. Prescott, Milwaukee; treasurer, W. H. Wiley, New York City.

Ohio Commission Rules Against Passes.—The Ohio railroad commission has issued a ruling in regard to free transportation, which applies to both steam and electric interurban railways. The ruling is that free passes or special rates for use entirely within the state can lawfully be issued only to such persons as ministers of the gospel, agents of incorporated colleges and charitable institutions when traveling on business, destitute and homeless persons, railroad officers and employes, and attendants in shipping live stock. The maximum penalty for violation is \$10,000.

Express Service in Indiana.—The Indiana Union Traction Company has inaugurated a special express service on all its lines independent of express companies. A general express business will be conducted by the company which will carry packages and parcels, night and day, at a greatly reduced rate. All cars except the limiteds will carry express and special attention will be paid to the delivery of all consigned goods. By adopting a general express service the traction company adds another important feature to its business and one which the people will be pleased with, as it will afford them quick service at nearly every hour in the day.

Pittsburg Railways Company Abandons Park Business.—James D. Callery, president of the Pittsburg Railways Company, has announced that the company has given up its park business. Calhoun and Oakwood parks have been sold for building purposes and Duquesne Garden, Kenneywood and Southern parks have been leased to A. S. McSwigan, A. F. Morgan and W. F. Homburger, all experienced park managers. Mr. McSwigan has had charge of the company's amusements and advertising since its organization five years ago, and will continue to be identified with the company. Under the management of the lessees Kenneywood and Southern parks will be greatly improved and several new features will be added.

Bridge Loop Terminal at End of Brooklyn Bridge.—The city of New York has acquired the property now occupied by the Staats-Zetting building and others, bounded by City Hall place, Park Row, Duane and Center streets, which is to be used as the terminal of the proposed elevated loop from the Manhattan end of the Brooklyn bridge, as authorized by the board of estimates on November 24. The loop is to be connected with the elevated tracks of the Brooklyn Rapid Transit Company and is expected to relieve greatly the congestion on the bridge. The terminal is to be but a temporary one, to relieve the present crush, and may be torn down and eliminated after the subway loop and new bridges are completed. Surface cars may be run out of the

loop in some fashion to ease the crush during rush hours. Work is to begin in about 60 days.

Clubhouses for Portland Street-Car Men.—The Portland (Ore.) Railway Company has announced that it will build four clubhouses for the use of its employes next year, each building to cost about \$10,000, and each one to be located near a car barn.

Manufacturers' Association Elects Officers.—Mr. James H. McGraw was re-elected president of the American Street & Interurban Railway Manufacturers' Association at a meeting of the executive committee held in New York on Friday, December 28. The committee elected other officers as follows: Vice-president, F. C. Randall of the Allis-Chalmers Company; treasurer, Joseph R. Ellicott of the Westinghouse Traction Brake Company; secretary, Mr. George Keegan of the Interborough Rapid Transit Company. Mr. Charles C. Peirce of the General Electric Company was unanimously chosen chairman of the entertainment committee for the next convention.

Electric Cars Must Stop at Steam Road Grade Crossings.—The Ohio railway commission has ruled that the duty of the electric lines is to stop the cars at all steam railroad crossings at grade. The ruling declares that the cars must stop not less than ten feet nor more than fifty feet from the crossing and must remain at a standstill until an officer of the car has gone entirely across the steam railroad tracks to ascertain whether there is any danger. The car is not permitted to start until signaled to do so by the officer of the company. The managers of the electric lines have been instructed to post this information in a conspicuous place in the cars of the company and in the shops of the electric lines and at the offices.

Interurbans Claim Discrimination by Steam Road.—Several of the interurban roads entering Toledo are complaining of an alleged discrimination in the matter of switching charges by the Toledo Railway & Terminal Company, a steam road, and it is probable that the Ohio railroad commission will be asked to investigate the matter. The tariff sheet of the Terminal company shows that the switching of interurban cars is charged at the rate of \$3 per car while the steam roads are charged only \$1 per car. As every interurban road entering Toledo necessarily crosses the tracks of the Terminal and as nearly all are engaged in the handling of freight they must depend on the Terminal for the transfer of freight cars from one road to the other, and the extra charge often amounts to a considerable sum.

Oklahoma Electric Railway & Gas Association.—A large number of representatives of the electrical and gas industries of Oklahoma met in the chamber of commerce, Oklahoma City, on December 13 and organized the Oklahoma Electric Railway & Gas Association. A constitution and by-laws were adopted and a large number of members was enrolled. Officers were elected as follows: President, F. H. Tidman, manager Oklahoma Gas & Electric Company, Oklahoma City; first vice-president, F. P. Stearns, Shawnee, Okla.; second vice-president, H. C. Stettinund, president Stettinund Electric Company, Chandler, Okla.; third vice-president, E. M. Cooper, Degnan & Co., Wilburton, I. T.; secretary, Charles W. Ford, general superintendent Oklahoma City Railway; treasurer, John H. Merrill, manager Choctaw Railway & Lighting Company, South McAlester, I. T.

Bridge Loop Commission Proposed for New York.—Mr. Edward C. Dowling, of Brooklyn, will introduce into the New York legislature at the coming session a bill which, if passed, will take out of the hands of the New York City rapid transit commission all authority in regard to the construction of an elevated loop between the Brooklyn and Williamsburg bridges. The bill provides for the appointment of the mayor of five persons, one of whom shall be a practical civil engineer, to be known as the "bridge loop commission." This commission is to be authorized to prepare plans for the construction of a two-track elevated railroad in Center street, the Bowers and Delancey street, connecting the terminals of the Williamsburg and Brooklyn bridges. The bill further authorizes the commission, with the approval of the board of estimate, to enter into contract with any company operating an elevated railroad in New York, for the use of the structure.

Annual Count of Brooklyn and Williamsburg Bridge Passengers.—The annual count of the passengers crossing the Williamsburg and Brooklyn bridges was recently completed for the bridge department of New York City by the Brooklyn Rapid Transit Company. The count was made by the company's agents and by conductors of its cars and of the cars of the Coney Island & Brooklyn system and extended from midnight December 12 until midnight December 13. The weather conditions on that day were inclement, so that the count is not entirely indicative of normal traffic. The day for counting was set well in advance and was taken as representative of the bridge traffic for the year. On the Brooklyn bridge 283,429 passengers were carried from Manhattan to Brooklyn in the 24 hours, while 207,153 passengers were carried in the opposite direction, making a total of 390,582 passengers who used the structure on December 12. Of the Manhattan bound passengers, 88,172 crossed the bridge from seven o'clock in the morning to eight thirty o'clock. In the evening rush hours (from five to seven o'clock) 86,618 passengers crossed the bridge towards Brooklyn on surface and cable cars. The Williamsburg bridge is being plied to make a respectable showing as a passenger carrier. On that same day and in the same hours the Brooklyn trolley route on the local bridge cars carried 4,271 passengers from Williamsburg to Manhattan and 51,721 passengers from Delancey street to Brooklyn a total of 96,492 passengers. These figures do not include the cars of the Metropolitan system which use the north

tracks, but do include all the lines of the Brooklyn Rapid Transit and Coney Island & Brooklyn systems.

Jurisdiction of State Commission Over City Lines.—Governor Davidson of Wisconsin is reported to have written in his forthcoming message to the legislature a demand for the enactment of a law providing for the regulation of street and interurban traction systems by the present existing state railroad rate commission. The commission has already before it some cases which involve the question of its authority in this regard and it assumes authority whenever the traffic complained of extends beyond the corporate limits of a municipality, but the governor proposes that the commission shall be given power to regulate the business of purely urban as well as interurban and steam railroads. The most urgent popular demand for such regulation comes from Milwaukee, where the people are demanding a reduction of fare from the customary five cents, for general transfer privileges and for the prevention of the collection of two fares when the passenger rides outside of the city limits.

Pension System for Employees in Washington.—A pension system, to take effect on January 1, has been established by the Washington Railway & Electric Company and allied companies for the purpose of pensioning employees who have attained the age of 70 years, those who for 20 years or more have been continuously in the service of the company, and those who become physically disqualified by reason of injuries received in the line of duty. The company has appropriated \$5,000 per annum to defray the expense of the system. A pension board will be created for the purpose of considering and passing upon all matters in connection with the system. The board will consist of not less than five nor more than seven members, who will be appointed by the president of the company, and will serve during his pleasure. Forty per cent per annum of the average annual wages for the ten years previous to retirement will be paid in monthly instalments to those who have served the company continuously for 35 years or more; 30 per cent for 30 to 35 years' service; 25 per cent for 25 to 30 years; and 20 per cent for 20 to 25 years. To be eligible for pensions employees must be members of the Washington Railway Relief Association.

Annual Meeting Central Electric Railway Association.—The annual meeting and election of officers, together with the first annual dinner, of the Central Electric Railway Association will be held Thursday, January 24, 1907, at the Claypool hotel, Indianapolis, Ind. The business meeting and election of officers of the association will take place at the morning session at 10:30 o'clock. At the afternoon session the following subjects will be discussed: 1. Cost of power for rental purposes. 2. Developing a demand for renting power; does it pay? 3. The model car for long travel. 4. Car lighting. 5. Handling of accidents and claims. Elaborate arrangements are being made by the railroad officials of Indianapolis to make this a red-letter day and one of great importance to the entire railway fraternity of the middle west. One of the features will be the massing at Indianapolis for exhibition the various types of interurban cars now in service; it is also desired that all private cars in the middle west be centered at Indianapolis for this date. Ample arrangements have been made by the Indianapolis Traction & Terminal Company under the supervision of Mr. J. J. Mahoney, superintendent of the company, to have all the cars massed in the center of the city on one of the side streets opposite the Claypool hotel. Many prominent electric railway men from all parts of the country have been invited to be present, and under the direction of Mr. Charles L. Henry as toastmaster the after-dinner program will be elaborate.

Metropolitan System to Discontinue Street Transfer Agents.—The Metropolitan Street Railway of New York City discontinued on January 1 the employment of street transfer agents, which have been stationed at important traffic corners. The change is also intended to prevent the issuing of two transfers, one on the car and another at a transfer point, and to simplify a system which is confusing to people not familiar with it. Mr. Oren Root, Jr., the general manager, is quoted as follows: "Although we have as many men stationed at the transfer points as is practicable they are not able to handle the crowds in the rush hours and while one carload of people is transferring the cars behind continue to back up and cause a very bad congestion. Take the transfer station at Astor place and Broadway. We have three men there, the largest number possible without running the risk of issuing transfers several times to the same person. They are not able to pass the crowd fast enough and as many as ten cars sometimes are waiting to get to the transfer corner. We have had police stationed there to handle the crowd, but it is not possible for them to do so. If the conductors issue the transfers we believe that the cars will not be stalled in this manner and that traffic will go on uninterrupted. Transfer agents are also continually engaged in disputes with persons who say they have just alighted from a car, when they have actually walked in back of it at the transfer point and mingled with the passengers. The agents are put in the best possible position for seeing all those who alight, but although they are many times sure that certain persons have not come from the cars they are not able to prove it and trouble ensues. Also, many persons who ride on the principal lines of the city get two transfers, one on the car and another at a transfer point. We have calculated that at a minimum 2,000 cases such as this occur daily. On the Broadway downtown line a man may get a transfer for Fourteenth street on the car and at Twenty-third street get off and get a transfer from the agent. This transfer he will trade for a newspaper or something of that sort and then continue his trip in Fourteenth street. In the course of a year this loss alone

amounts to many thousands of dollars. In addition to all this the double system is generally undesirable and causes confusion, especially in the case of people who are not familiar with the city. Many cases of this kind have come to our attention lately."

New York New Haven & Hartford Acquires Electric Railways.

Formal announcement was made on December 20 of the completion of the purchase by the New York New Haven & Hartford Railroad of the Rhode Island Securities Company and the Rhode Island Company, both of Providence, R. I. The Rhode Island Securities Company owns the stock of the Rhode Island Company which controls practically all of the electric railways of the state. Both were controlled by the United Gas Improvement Company of Philadelphia. At the same time the leasing of the Connecticut Railway & Lighting Company and the purchase of various other electric railway and power companies of the state was announced. The official statement, as given out from the office of President C. S. Mellen, follows: "The New Haven road has purchased the capital stock and all of the indebtedness of the Rhode Island Securities Company, paying therefor in debentures of the Providence Securities Company (a Connecticut corporation), bearing interest at 4 per cent and indorsed as to principal and interest by the New Haven road at par for said stock and indebtedness as of August 1, 1906, upon the payment by present holders of Rhode Island Securities Company stock of an assessment of \$10 in cash: a share.

"Upon the completion of this purchase today the directorate of the Rhode Island Company and the Rhode Island Securities Company has been changed by a majority of said directors resigning and representatives of the New Haven road being temporarily elected in their places pending the permanent reorganization of the directorate.

"In pursuance of the above, Mr. Mellen of the New Haven road has been elected president of the Rhode Island Company and the Rhode Island Securities Company. A. S. May has been elected treasurer and J. G. Parker secretary of both companies, these men occupying relatively the same positions with the New Haven company.

"At the same time a lease has been taken, practically in perpetuity, of the properties of the Connecticut Railway & Lighting Company in Connecticut, and possession has been given to the Consolidated Railway Company, the corporation which has been formed to handle the electric properties of the New Haven road.

"A purchase has also been made of the United Gas Improvement Company interests of all the capital stock of the Meriden Southington & Compounce Tramway Company, of the New Milford Power Company, and the Housatonic Power Company, and changes in the organizations of those companies have been perfected whereby the officers of the Consolidated Railway Company have been elected and the directorate of the companies changed so that a majority of the directors are now held in the interest of the Consolidated Railway Company.

"No immediate change is contemplated in the management of the properties or in the subordinate officers, everything will continue as before until the new owners become familiar with the property. The hope of the new holders is that by the expansion of the properties and development of facilities the same will become more valuable and justify the prices paid for their control.

"In connection with the Rhode Island purchase, Edward G. Buckland, the attorney, of New Haven, has been elected a vice-president of the New Haven road, with offices at Providence, and will more particularly represent the interests of the company in all its departments in that locality hereafter."

Announcement had previously been made of the purchase of the Ray system of lines in Rhode Island and Massachusetts, including the Woonsocket Street Railway, the Providence & Burrillville Street Railway, the Milford Attleboro & Woonsocket Street Railway and the Columbian Street Railway. The purchase of the Rhode Island Company, with its lines in Providence, Pawtucket and vicinity completes monopoly of the electric railway business of the state. The Rhode Island Company at its last report was capitalized at \$20,000,000 and represents about 300 miles of track. The entire system in Massachusetts, Rhode Island and Connecticut now comprises some 1,350 miles of single track, with estimated gross earnings of approximately \$15,000,000 a year, and with an estimated market value of stocks and bonds of about \$125,000,000.

This great system, with the exception of 50 or 60 miles, has been acquired during the past three years since Mr. Mellen became president of the road, and its further expansion to any great extent is precluded by geographical considerations. With the exception of a few small roads in Massachusetts there are no more electric roads which the New Haven would reasonably care to acquire and it now enjoys a complete electric monopoly in its territory.

According to a statement by Vice-president E. G. Buckland, Mr. A. T. Potter will retain his position as vice-president of the Rhode Island Company. Mr. A. E. Potter, general manager, will also be retained, with jurisdiction over the electric lines of the entire state. Marsden J. Perry, president of the Rhode Island Company, who is recognized as the foremost electric railway builder of the state, will no longer be identified with the company except as a director.

One of the most important features of the deal, which, as announced by Mr. Buckland, will be developed as soon as practicable, is that the New Haven road is now in an excellent position to carry out its long-cherished plan of freight distribution, by which freight cars may be switched onto the city streets at night and their contents delivered to business concerns at their doors. The plan also contemplates a similar service for passengers in the event of electrification on the main line.

Construction News

FRANCHISES.

Albany, N. Y.—The New York railroad commission has denied the application of the Rochester Corning & Elmira Traction Company for a certificate of necessity to construct an electric line from Rochester to Elmira, N. Y. In denying the application the board points out that the territory proposed to be benefited by the proposed electric line is already served by one or more steam roads, one of which (the Erie) is electrifying its system between Rochester and Elmira, and that under these circumstances it was unable to say that public convenience and necessity required the construction of the railroad.

Albany, N. Y.—The state railroad commission has granted a certificate of necessity to the Malone Fort Covington & Hopkins Point Railway for a road from Malone to Hopkins Point, in Franklin county, N. Y., 16 miles. The road is to be continued to Dundee, Quebec.

Chicago, Ill.—The city council has authorized the Chicago Union Traction Company to double track its line on Fortieth avenue between Taylor and West Madison streets. The company will at once lay a temporary track to care for the winter traffic and will rebuild it before August 1, 1907. It was agreed that this shall not be considered as a franchise extension.

Defiance, O.—Permission has been granted the Indiana Columbus & Eastern Traction Company to cross the Second street bridge over the Auglaize river, in order to extend the Columbus & Lake Michigan steam road, which is to be electrified into Defiance. A franchise in Defiance has already been granted.

Denville, N. J.—The Morris County Traction Company has been granted a 40-year franchise for a connecting line between Denville and Boonton, N. J. F. H. Alleman, of Morristown, N. J., is general manager.

Dunkirk, N. Y.—The New York railroad commission has granted a certificate of necessity to the Dunkirk Street Railway for a 3½-mile belt line in the city of Dunkirk, and to the Buffalo & Lackawanna Traction Company for a proposed line from Hamburg turnpike to Lafayette square in Buffalo. Both companies are a part of the Buffalo & Lake Erie Traction Company which will connect Buffalo, N. Y., with Erie, Pa.

Evanston, Ill.—The Chicago Evanston & North Shore Railway is applying for a 50-year franchise for a line through the town, agreeing to pay \$66,250 in annual instalments, beginning with \$250 a year and increasing at stated periods.

Findlay, O.—The Findlay-Marion Railway & Light Company has been granted a franchise over the county roads from Marion to Delaware, O.

Freeburg, Ill.—A 20-year franchise has been granted to the Belleville & Pinckneyville Traction Company, which proposes to build from Belleville to Pinckneyville, Ill., via Freeburg.

Lima, O.—The temporary injunction against the franchise recently granted by the city council to the Schoepf syndicate has been dissolved by the court, after a long controversy. The franchise, which is for 25 years, is for the line from Lima to Bellefontaine and it is stated that work will be commenced at once in Lima. This line connects at Lima with the syndicate's Lima & Toledo Traction Company, which is now in operation as far as Leipsic, and at Bellefontaine with lines owned by the same interests extending to Springfield, Dayton and Cincinnati.

Macon, Ga.—A 50-year franchise has been granted to the Macon American & Albany Electric Railway, entering the city at the intersection of Boundary and Elbert streets. Work is to begin in the city within 12 months and cars must be run to Ft. Valley within two years.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis.—This company is circulating petitions to secure a franchise from the township of Milwaukee for an extension of its Third street line. The Milwaukee-Northern Electric Railway recently got a franchise from this town in return for which it proposes to carry passengers for a three-cent fare.

Pittsburg, Pa.—The Monongahela Street Railway has applied for a franchise for either a single or double-track line on Frankstown avenue from the Penn township line to Oakwood street.

Puyallup, Wash.—The city council has granted a franchise to the Puget Sound Electric Railway for its proposed extension from Tacoma to Puyallup and Orting. General Manager W. S. Dimmock Tacoma, Wash., says that work is to begin immediately at the Puyallup end.

Seattle, Wash.—The city council has passed over the mayor's veto the franchise for the Seattle Electric Company over Second avenue, Denny Way, Third avenue, Roy, W. B. and other streets.

Sidney, Ia.—The city council has extended for three years the franchise granted some time ago to the Council Bluffs, Taylor & Southern Electric Railway. The company was also granted an electric light franchise.

Springfield, Ill.—The city council has granted a 50-year franchise to the Springfield & Southeastern Traction Company for an independent entrance to the city for its proposed line to Pana and Vandalia.

INCORPORATIONS.

Alabama Railway & Power Company.—Incorporated in Alabama to build either a steam or electric railway from Chattanooga, Tenn., to Birmingham, Ala. Capital stock \$100,000. Incorporators: H. T. Henderson, Durango, Cal.; C. L. Young, J. M. and J. H. Hill, Ft. Payne, Ala.; and J. P. Montgomery, of Asheville, Ala.

Amarillo Street Railway.—This company has applied for a charter in Texas to build 3 miles of street railway. Capital stock \$250,000. Incorporators: John L. Brock and C. C. Harris, of Decatur, Ala.; J. C. Paul, H. A. Noble, J. W. Crudgington, S. D. Wharton, W. E. Kirk, C. E. Pash and John K. Shifman, of Amarillo.

Asheville Rapid Transit Company.—Incorporated in North Carolina with power to build an electric railway to any point within 25 miles of Asheville. The immediate intention, however, is only to build to Overlook Park on Sunset Mountain and Weaverville. The company has acquired the Overlook Park & Loop Line Railway and will rebuild its line to the mountain. Capital stock, \$500,000. Incorporators: Charles E. Van Bibber, of Holden, Mass.; Thomas S. Rollins and John P. Arthur, of Asheville.

Cleveland & Indianapolis Interurban Railway.—Incorporated in Ohio to build an electric line from Norwalk, O., to Bluffton, Ind., passing through Tiffin, Findlay, Ottawa and Van Wert, O., and Decatur and Bluffton, Ind. The road will connect at Norwalk with the Lake Shore Electric and the Cleveland & Southwestern for Cleveland and at Bluffton with the lines of the Indiana Union Traction Company for Indianapolis. It is stated that financial arrangements have been made for the preliminary work and that Riggs & Sherman of Toledo have commenced surveys. Incorporators: C. F. Jackson, S. W. Owen and E. L. Young, of Norwalk; P. J. Poole, John P. Montgomery and W. S. Parker of Findlay.

Columbus Traction Company.—Incorporated at Columbus, O., with a capitalization of \$1,000,000 for the purpose of taking over the Central Market Street Railway system, of Columbus, under the terms recently agreed upon between officials of the Columbus Railway & Light Company and A. E. Locke, of Boston, who has been holding the property for the Schoepf syndicate. At the annual meeting of the Columbus Railway & Light Company on January 29, the stockholders will be asked to vote on the proposition of taking over the Columbus Traction Company property for operation on the same terms that it holds and operates the Columbus Railway Company and the Columbus Edison Company. The officers of the Columbus Traction Company were elected last week as follows: President, Butler Sheldon; first vice-president, secretary and treasurer, Frank T. Stewart, and second vice-president, George Hardy. These, with William K. Lanman and Hartford Stewart, constitute the board of directors.

Hanover & York Street Railway.—Incorporated in Pennsylvania for the purpose of building a trolley road beginning at the junction of West King street and Highland avenue, West York, and continuing on through West Manchester township to Bear station and Spring Grove. Capital stock, \$120,000. Incorporators: President, W. F. Bay Stewart; George H. Frazier, Philadelphia; Grier Hersh, York; George S. Schmidt, York; A. H. Hayward, York; David Young, Newark, N. J., and Thomas Newall, Philadelphia.

Evansville & Southern Indiana Traction Company.—Incorporated in Indiana with \$4,500,000 capital stock. The intentions of the company are not stated, although it is believed that it will ultimately build from Evansville, Ind.; to Louisville, Ky. Incorporators: Hugh J. McGowan, of Indianapolis; James and Charles Murdock and Henry Marshall, of Lafayette, Ind.; H. B. Smith, Hartford City, Ind.; L. G. Neely, Lima, O.; W. T. Durbin and Robert I. Todd, of Indianapolis; T. S. Kurtz and J. W. Van Dyke.

Indianapolis Crawfordsville & Danville Traction Company.—Incorporated in Indiana to build an electric railway from Crawfordsville, Ind., through Covington, and Veedersburg to Danville, Ill., to be operated in connection with the Indianapolis & Northwestern Traction Company, which has a road from Indianapolis to Crawfordsville. It is stated that several franchisees and some right of way has been secured. Capital stock \$600,000. Incorporators: John J. Appel, Robert I. Todd, T. B. McMath, Fletcher M. Durbin and W. F. Millholland, all associated with the McGowan syndicate.

Saginaw Owosso & Lansing Railway.—Incorporated under the general railway laws of Michigan to build an electric railway from Saginaw to Owosso and Lansing with branches to Alton and Durand. Capital stock \$600,000. Incorporators: J. L. King, Saratoga, N. Y.; F. S. Richard, Cleveland, O.; George B. Morley, of Saginaw, Mich.; Phil H. McMillan, George Black, Frank W. Eddy, Frank West, Charles W. Baird, Thomas E. Roeder, Charles B. Warren, William H. Cady and J. A. Thlek, of Detroit.

San Bernardino Urban Railway.—Incorporated in California to build an electric railway from San Bernardino to Rialto, Ontario, Riverside and Redlands, Cal. Capital stock \$1,000,000. Incorporators: H. B. Harris, Victor Smith, A. G. Kendall, O. L. Moorman and B. S. Draper.

Stauben Traction Company.—Incorporated in New York with headquarters at Hornell, to effect a consolidation of the Hornellville Electric Railway, Hornellsville & Canisteo Railway, Canisteo Valley Railway and Canisteo Jasper & Woodhill Railway. Capital stock \$750,000. Incorporators: Charles Adit of Hornell, J. W. Powell of Canisteo, and L. D. Whiting, of Jasper.

TRACK AND ROADWAY.

Evansville & Eastern Electric Railway.—It is reported that this line from Evansville to Rockport, Ind., 24 miles, is nearly ready for operation its entire distance. Track is laid practically into Rockport and the grading within the city is being completed. W. H. McCurdy, Evansville, Ind., president.

Ft. Wayne & Springfield Railway.—It is stated that it is hoped to have this road in operation between Springfield and Decatur this week. The power house at Decatur is ready for operation, the overhead wires have been tightened, and the roadbed is said to be in good condition. W. H. Fledderjohann, of Decatur, Ind., is president and general manager.

Kansas City St. Joseph & Excelsior Springs Electric Railway.—Work has been started on the construction of this company's \$2,000,000 bridge over the Missouri river near Kansas City. The line is to connect Kansas City and St. Joseph, Mo., 52 miles.

Lexington & Interurban Railway.—This company, which recently took over the property of the Winchester Railway Light & Ice Company, of Winchester, Ky., is rebuilding the track and roadway of the new acquisition and making many other improvements in the system. During the period of rebuilding the line no cars have been run, though it has been announced that a regular schedule would be resumed on January 1. The tracks are being laid with new 70-pound T-rails in crushed stone ballast. It is expected that the Winchester property will later serve as the eastern terminus of the interurban line that the company proposes to build between Lexington and Winchester.

Milwaukee, Wis.—Mayor Thomas L. Johnson of Cleveland, G. J. Kobusch of the St. Louis Car Company and Joseph Heim, a Kansas City brewer, are said to be planning to build a street car line in Milwaukee 60 miles long. Their plan is reported to be to connect all city parks, railroad stations and other places of importance with a system which will charge a fare of but 3 cents. Milwaukee capitalists are alleged to be ready to invest several hundred thousand dollars to assist the outsiders. A map has been prepared, showing that the routes contemplated will parallel many tracks of the Milwaukee Electric Railway & Light Company at distances of one to four blocks.

New York New Haven & Hartford Railroad.—Vice-president E. G. Buckland has given out a statement that it is the intention to operate fast electric trains between Providence and Boston as soon as the tunnel in Providence is completed, provided the electrification of the line between Stamford, Conn., and New York proves a success.

Northern Electric Company.—This company, which is building a line from Chico to Sacramento, Cal., 150 miles, and which has a line in operation as far as Oroville, 10 miles, will begin work some time in January on a line from Chico to Red Bluff, for which a location survey has been made. Work will begin at Red Bluff on account of the right of way situation. A. D. Schindler, general manager, Chico, Cal.

Springfield & Southeastern Traction Company.—Work on this line between Springfield and Pana, Ill., is to be started early in the spring at a point between Taylorville and Pana. The contract has been awarded to the G. R. Turner Construction Company, of New Orleans. Chief Engineer C. F. Terhune, of Taylorville, has completed surveys and all the franchises have been secured, including an independent entrance to Springfield. The capital stock is \$250,000, which is to be increased to \$2,250,000 at the next meeting of the directors. J. J. Finn, of Decatur, president; M. P. Vale, of Chicago, secretary.

Boston & Providence Electric Railway.—The Stone & Webster Engineering Corporation, of Boston, Mass., announces its intention of organizing a company under the above name to build an electric railway from Forest Hills to Seekonk, Mass., on the Massachusetts-Rhode Island state line, passing through Hyde Park, Dedham, Westwood, Norwood, Canton, Sharon, Foxborough, Mansfield, and Attleboro. Capital stock \$5,000,000. Directors: Russell Cobb, Concord, Mass.; H. Heustis Newton, Everett, Mass.; Frederick E. Snow, Boston; Frederick S. Pratt, Newton; James L. Richards, Newton.

Chicago Lake Shore & South Bend Railway.—J. B. Hanna, president, South Bend, Ind., writes that this road will extend from a connection with the Illinois Central Railroad at Kensington, Ill., through Hammond, Indiana Harbor, East Chicago, Gary, Michigan City and New Carlisle to South Bend, Ind., 78 miles. Franchises have been secured in all the towns and the entire right of way has been purchased. Surveys have been made for the entire distance and 15 miles, from South Bend to New Carlisle, has been graded. Grading is now in progress between New Carlisle and East Chicago and will continue throughout the winter, as will the tracklaying. About 2 miles of track have been laid. The United States Steel Corporation has the contract for the rails, 70-pound, and 10½ miles of steel and 30,000 ties have been distributed along the right of way. The Cleveland Construction Company has the contract for the grading, the power house, which is to be located at Michigan City, the substations and pole lines. The site for the power house has been purchased. Single-phase current will be used. The equipment for the power house and substations will be contracted for in January. The overhead construction will be of the single catenary type, suspended from center poles set in concrete. The sliding contact will be used instead of a trolley wheel. It is probable that the car house and shops may be located at Michigan City. John W. S. Reigle, of South Bend, is the chief engineer.

Denver City Tramway.—President William G. Evans has announced that this company has made a traffic agreement with the Colorado & Southern Railroad, which is electrifying its line between Boulder and Denver, Colo., whereby the latter will carry its passengers into the heart of Denver over the Tramway system. Mr. Evans also stated that plans are being made for 42 miles of extensions, including several lines and loops within the city, and lines to Globeville, Ft. Logan and Valverde, at a cost of about \$3,500,000.

East Liverpool Traction & Light Company.—This company has disposed of \$2,750,000 of its bonds for the construction of several extensions and over 2,000 men are to be set at work at once on the new line from Wellsville to Empire, O., 10 miles. The Ohio River Railways Company, a subsidiary property chartered under the laws of Pennsylvania, will build an extension to connect the Ohio lines of the East Liverpool Traction & Light Company with those of the Beaver Valley Traction Company at Vanport, Pa. J. C. Rothery, general manager, East Liverpool.

East River Tunnel, New York.—The shields in the north bore of the East River tunnel met on December 15 under the middle of the river and the engineers report that the two sections joined perfectly. This is the extension of the present Rapid Transit subway from the Battery to Joralemon street, Brooklyn, and which is being built by the New York Tunnel Company for the Rapid Transit Subway Construction Company, to which the city awarded the contract for the Brooklyn extension of the subway.

Ft. Dodge Des Moines & Southern Electric Railway.—Construction work on this line from Fort Dodge to Des Moines, Ia., has been discontinued until spring.

Galesburg & Kewanee Electric Railway.—The nine-mile interurban line connecting Kewanee and Galva, Ill., was recently opened for operation. W. H. Lyman, president, Kewanee, Ill.

Houston-Galveston Traction Company.—It is reported that the final route of this line which the Stone & Webster Engineering Corporation, of Boston, proposes to build between Houston and Galveston, Tex., has been located along the Harrisburg road from Houston to Harrisburg and parallel to the Galveston Houston & Henderson to Galveston.

Illinois Traction Company.—The first car was operated over the new Springfield-Lincoln division on December 15 and regular operation was begun on December 16.

Indianapolis Crawfordsville & Western Traction Company.—It is announced that it is hoped to run cars soon after the first of the year on this new line from Indianapolis to Crawfordsville, Ind., which is nearing completion. A large force of laborers is now at work and the track is laid from Indianapolis nearly to Crawfordsville. The poles have been set and wires are being strung. A. E. Reynolds, general manager, Indianapolis.

Lewiston Brunswick & Bath Street Railway.—It is reported that surveys have been made and plans nearly completed for an extension of the Sabattus branch of this road from Sabattus through Litchfield Corner to Gardiner, Me., there to connect with the line from Gardiner to Augusta. E. D. Reid, chief engineer, Lewiston, Me.

Lima Kenton & Marion Traction Company.—A contract has been let to the Lackawanna Steel Company, of Buffalo, N. Y., for 51 miles of steel rails for the proposed line from Lima to Marion, O. The company has secured options on the resort property at Magnetic Springs. Joseph A. Vandergrift, of New York, president.

Long Island Railroad.—Plans have been prepared for a new model station at Jamaica, L. I., and for the elimination of all grade crossings in and near the town. Twelve tracks will enter the station, eight tracks for through trains and four for suburban trains from New York. A thoroughfare running directly under the station platforms will be built and every platform will be reached by steps from below.

New York Subway.—The New York rapid transit commission has instructed Chief Engineer Rice to prepare plans for a double-deck subway, with the two lower tracks for express train service and the two upper tracks for local service, for the Lexington avenue subway route, one of the seven routes for which bids will be advertised some time in January. The route extends from the Bronx to Thirty-sixth street on Lexington avenue and on Thirty-sixth street west to Broadway. On Broadway from Thirty-sixth street to the Battery the four tracks will all be on the same level. The lower tracks are to be 35 feet below the surface. Mr. Rice says he will have the plans ready in three weeks.

Roanoke Railway & Electric Company.—The directors have authorized an expenditure of \$108,000 for various improvements, including considerable double tracking and paving, new cars, additional power equipment, and the first section of a new car house. R. D. Apperson, president, Lynchburg, Va.

Utah Light & Railway Company.—General Manager Joseph E. Wells has submitted plans for improvements during the coming year involving an expenditure of \$3,250,000, including reconstruction of tracks and extensions, power house with two 5,000-k.w. units and provision for a third similar unit, the placing of the wires underground in the paved district, material yards, trolley and feed wire reconstruction, 1,500-kv. motor generator, additional transformers, and 50 new cars.

Worcester Consolidated Street Railway.—This company's air line from Worcester to Leominster was opened for traffic on December 18.

POWER HOUSES AND SUBSTATIONS.

Brooklyn Rapid Transit Company.—This company is reported to have ordered from the Westinghouse Machine Company five Westinghouse-Parsons steam turbines of 10,000 kw. capacity each, and an equal number of electric generators from the Westinghouse Electric & Manufacturing Company, to be installed in the Kent avenue power house. The company has already contracted with the Westinghouse company for four 7,500-kw. turbines, of which two have been installed and an Allis-Chalmers 5,500-kw. turbine has also been installed.

Charleston & Summerville Electric Railway.—As announced the track and roadway work of this 27-mile line from Charleston to Summerville, S. C., is progressing rapidly. The power house near Charleston will be equipped with Snow gas engines and 6,600-volt single-phase electrical apparatus will be used. D. E. Baxter & Company, Incorporated, 27 William street, New York, has the complete contract covering the construction and equipment of the road ready for operation.

Chattanooga Railways.—The Ridgedale power house at Chattanooga, Tenn., is being remodeled and its capacity largely increased. Large new water-tube boilers are being installed and a new 800-kw. generator has just arrived. Several carloads of machinery are to be shipped. D. J. Duncan, general manager, Philadelphia, Pa.

Ft. Wayne & Wabash Valley Traction Company.—This company, it is reported, will expend \$50,000 in the enlargement of its power plant at Lafayette, Ind. An addition will be made to the building and enough new machinery will be installed to give the plant 2,200 horsepower. Work is to begin in a short time and the enlargement of the plant will be completed by the time that the Lafayette & Logansport traction line is ready for operation. The work on the grade for the line is progressing nicely at the Lafayette end of the road.

Georgia Railway & Electric Company.—This company has ordered and will shortly receive a Snow gas engine and dynamo of 3,000 horsepower capacity, which will be installed in the Devils street power house, Atlanta, Ga., as an auxiliary unit. To accommodate this engine the building has been enlarged by an extension 50 by 150 feet.

Jackson Electric Railway Light & Power Company.—This company's new power plant at Jackson, Miss., which has just been completed at a cost of \$125,000, was put in operation for the first time on December 15.

Lake Shore Electric Railway.—This company is building a new substation a short distance west of Cleveland.

North Midland Electric Railway.—It is reported that this company will enlarge its power plant at Stratford, Ont., at a cost of \$100,000.

Orange County Traction Company.—This company has purchased a tract of land in Newburg, N. Y., on which it will erect a large brick car barn and machine shops, which will accommodate all the company's rolling stock. Office, Newburg, N. Y.

Portsmouth (O.) Street Railroad & Light Company.—This company is preparing to install a 500-kw. Curtis steam turbine in its power house at New Boston, O. The increased power is needed to furnish current for the 4½-mile extension which is being made to the city lines. An additional turbine unit of 1,000-kw. capacity will be installed this year to care for the increasing demand made by manufacturers of the city for additional power.

Rapid River Light & Traction Company.—This company proposes to build a power plant on Rapid creek, at a cost of \$250,000. T. N. Blockhart, of Rapid City, S. D., is interested.

Roanoke Railway & Electric Company.—This company has recently installed in its power house at Roanoke, Va., a new 500-kw. General Electric railway generator, direct connected to a Corliss engine and a 500-kw. three-phase alternating current generator, direct connected to a McIntosh & Seymour vertical compound condensing engine. A Babcock & Wilcox 400-hp. boiler is now being installed which will increase the boiler capacity to 2,000 h. p. The above units will increase the generating capacity to 2,500 kw.

Rochester Railway & Light Company.—This company has filed plans for its new power station on Hastings street and Itavine avenue, Rochester, N. Y., which will be of reinforced concrete, to cost about \$57,000. Sellers & Ripley, Philadelphia, are the architects.

Scranton (Pa.) Railway.—This company is making preparations for the erection of a \$555,000 power house near Carlton street bridge on the Lackawanna river, in Scranton. The present power house will be converted into a repair shop. The company also expects to spend about \$150,000 for double tracking and improvements to its lines.

Texas Traction Company.—The General Electric Company has been awarded the contract for the electrical equipment of this line which is to run from Dallas to Sherman, Tex., 65 miles. The main power house will be located at McKinney and will be equipped with two 1,000-kw. Curtis steam turbo-generators. Current will be generated at 2,200 volts and 25 cycles and will be stepped up for transmission to 19,100 volts. Two 35-kw. motor-generator sets will be provided for exciting the fields. There will be six substations, including a portable one and one at the power house. Each substation will be equipped with a 300-kw., 600-volt rotary converter, oil-cooled transformers and the necessary switchboards and lightning arresters. J. F. Strickland, of Dallas, president

Personal Mention

Mr. E. E. Franklin, of Portland, Ore., has been appointed master mechanic of the Utah Light & Railway Company, at Salt Lake City, Utah.

Mr. Ira Schofield, heretofore master mechanic of the Toledo & Western Railway, at Sylvania, O., has been appointed superintendent of motive power.

Mr. C. W. Chase has resigned as secretary of the Mobile Light & Railroad Company, Mobile, Ala., to engage in other business in Leavenworth, Kan.

Mr. A. L. Lindner has resigned as general manager of the Citizens' Railway & Light Company, of Muscatine, Ia., which position he has held for three years.

Mr. D. M. Deininger, of Omaha, Neb., has been appointed auditor of the International Railway Company, of Buffalo, N. Y., succeeding Mr. A. C. Emmerleck, resigned on account of ill health.

Mr. C. C. Benson has been appointed general manager of the San Jose & Santa Clara Railway and the Santa Clara Interurban Railroad at San Jose, Cal., succeeding Richard Emory, deceased.

Mr. C. J. Franklin, who recently resigned as superintendent of the Tacoma Railway & Power Company, has been appointed general superintendent of the Portland (Ore.) Railway & Light Company.

Mr. T. K. Wells has resigned as superintendent of transportation of the Manila Electric Railway Company on account of ill health. Mr. Wells was formerly transportation manager of the Syracuse Rapid Transit Company.

Mr. Fenwick E. Lowe has been appointed superintendent of the St. Paul division of the Twin City Rapid Transit Company, succeeding Mr. C. C. Burdick, resigned. Heretofore Mr. Lowe has been chief clerk to the general manager.

Mr. G. E. Tracy, formerly master mechanic of the East St. Louis & Suburban Railway, has been appointed to a similar position with the Cleveland & Southwestern Traction Company, in charge of the shops now under construction at Elyria, O.

Mr. W. O. Woodward, formerly general passenger agent of the Indianapolis & Eastern Traction Company, has been appointed general passenger agent of the lines of the Indiana Columbus & Eastern Traction Company between Richmond, Ind., and Columbus, O.

Mr. D. Frederick Carver has resigned as general superintendent of the Rochester Railway Company, of Rochester, N. Y., and has been appointed assistant general manager of the Aurora Elgin & Chicago Railroad, with office at Wheaton, Ill., effective on January 1.

Mr. Charles F. Shelton has resigned as superintendent of the Ft. Wayne & Wabash Valley Traction Company, with office at Ft. Wayne, Ind. It is stated that no successor will be appointed but that Mr. Shelton's duties will be assumed by Mr. C. D. Emmons, general manager.

Mr. J. R. Harrigan, until recently general manager of the Canton-Akron Railway at Canton, O., has been appointed general manager of the Buffalo & Lake Erie Traction Company, of Buffalo, N. Y., a consolidation of the Sheehan-Mayer lines between Buffalo, N. Y., and Erie, Pa.

Mr. John H. Merrill, who resigned recently as secretary of the Central Electric Railway Association to become manager of the Choctaw Railway & Lighting Company, of South McAlester, I. T., has been elected treasurer of the newly organized Oklahoma Electric Railway and Gas Association.

Mr. J. D. Pope has been appointed chief electrical and mechanical engineer of the Lexington & Interurban Railway with headquarters at Lexington, Ky. Mr. Pope was formerly connected with electric railways in Virginia and other eastern states. He assumed his new duties on December 15.

Mr. Arthur B. Smith, assistant general passenger agent of the Northern Pacific Railway, with office at St. Paul, Minn., has been appointed traffic manager of the Consolidated Railway Company, of New Haven, Conn., which controls the electric railway system of the New York New Haven & Hartford Railroad.

Mr. James B. Luckey has resigned as secretary of the Washington (D. C.) Railway & Electric Company, to become secretary and business manager of the Street Railway Advertising Company of New York. Mr. Frederick J. Whitehead, heretofore secretary to the vice-president, has been elected to succeed Mr. Luckey.

Mr. A. Gadhbury has been appointed superintendent of the Montreal Street Railway the Montreal Park & Island Tramway the Montreal Terminal Railway and the Suburban Tramway & Power Company of Montreal, Que., succeeding the late L. Trudeau. Mr. Gadhbury has had practical charge of the operating department since Mr. Trudeau's illness last May.

Mr. S. L. Rhoades, chief claim agent of the Philadelphia Rapid Transit Company, has resigned to become general supervisor of claims of the Casualty Company of America at New York, N. Y. Mr. Rhoades has been associated with the claim department of the Rapid Transit company since 1888 and has been president of the American Street & Interurban Railway

Claim Agents' Association since its organization in 1905. Mr. Harry R. Goshorn, assistant claim agent, has been appointed chief claim agent to succeed Mr. Rhoades.

Mr. J. B. Ingersoll, heretofore assistant general manager and chief electrical engineer of the Spokane & Inland Railway and the Spokane Terminal Company, with office at Spokane, Wash., has been appointed general manager and chief electrical engineer. He succeeds Mr. F. A. Blackwell as general manager. Mr. Blackwell will remain as chairman of the board of the Spokane & Inland Empire Railroad system.

C. Loomis Allen, general manager of the Utica & Mohawk Valley Railway, the Rome City Street Railway and the Oneida Railway, has been elected vice-president and general manager of the Utica & Mohawk Valley Railway, the Rome City Street Railway, the Oneida Railway and the Syracuse Rapid Transit Railway, with office at Utica, N. Y., succeeding Mr. John J. Stanley, who has held that title since Mr. E. G. Connette resigned to go to Worcester. These appointments were made December 6 by the four companies interested. This places Mr. Allen in charge of the electric railway properties from Syracuse on the west to Little Falls on the east, including the electrification of the West Shore Railroad between Syracuse and Utica. Mr. Allen is a native of Syracuse and was educated at Alfred and Syracuse universities. He adopted civil engineering as a profession and was first employed with the Norfolk & Western Railway Company. In 1892 he went to Syracuse to engage in private practice as a civil engineer, being a member of the firm of Mather & Allen. In the spring of 1895 he was appointed civil engineer of the Syracuse system and had charge of the reconstruction of the track and overhead line on some 64 miles of road. Three years later he became assistant general manager and in February, 1899, he became general manager of this company. He left Syracuse on December 31, 1899, to accept the position of general manager of the Lorain Street Railway in Lorain, O., where he remained a year and a half. When the Andrews-Stanley interests acquired the property of the Utica & Mohawk Valley Railway Mr. Allen was offered and accepted the position of assistant general manager of that company with Mr. Stanley, and when Mr. Stanley, in May, 1902, returned to Cleveland Mr. Allen was made general manager of the Utica & Mohawk Valley Railroad and the Rome and Oneida properties. In 1904 Mr. Allen was president of the Street Railway Association of the state of New York.

Obituary.

J. W. Hartzell, promoter of the San Francisco Vallejo & Napa Valley Railroad, and who had long been identified with electric railway construction in California, died at Vallejo, Cal., on December 8, aged 67 years.

Nathaniel Pope Yeatman, secretary and treasurer of the Nashville Railway & Light Company since its reorganization in 1895 and prior to that time secretary and treasurer of the Nashville Street Railway and the Cumberland Electric Light & Power Company, died at his home in Nashville, Tenn., on December 19, aged 54 years.

George Franklin Wright, of the law firm of Wright & Baldwin, of Council Bluffs, Ia., and vice-president of the Omaha & Council Bluffs Railway & Bridge Company, died at his home in Council Bluffs on December 13, at the age of 73. Besides being prominent in his profession Mr. Wright had for many years been identified with various street railway enterprises. In 1863 with his associates, he organized and built the first street railway line in Council Bluffs, and was for a time president of the company. In 1886 with the same associates he organized the Omaha & Council Bluffs Railway & Bridge Company, operating the first electric railway in Iowa and Nebraska, now leased to the Omaha & Council Bluffs Street Railway, and in 1889 he was one of the organizers of the street railways of Ottawa, Ill.

Samuel Little, formerly president of the West End Street Railway, of Boston, Mass., died in Boston on December 21. Mr. Little was born at Hingham, Mass., on August 15, 1827, and completed his education at Hingham. He first became interested in street railways in 1872, when he aided in the organization and became treasurer of the Highland Street Railway, of Boston, when that road was later consolidated with the Middlesex Street Railway as the West End Street Railway. Mr. Little became a director of the consolidated company and in 1893 was made president, which position he held until his retirement from active business in 1900. The West End company is now leased to the Boston Elevated Railway Company. Mr. Little was well known as a business man and took an active part in public affairs.

General John M. Hood, formerly president and general manager of the Western Maryland, and since February, 1902, president of the United Railways & Electric Company of Baltimore, Md., died at his home in Baltimore on December 17 at the age of 63 years. He was born at Sykesville, Md., on April 5, 1843, and entered railway service in July, 1859, from which date to August, 1861, he was assistant engineer of the Delaware Railroad and the Eastern Shore Railroad. He was then for four years chief engineer of the Port Deposit Branch of the Philadelphia & Baltimore Central, and for one year engineer and superintendent of the last-named road. In April, 1870, he was appointed general superintendent of the Florida Railway, and from November, 1871, to April, 1873, was chief engineer of the Peach Bottom Railway. He then went to the Baltimore Philadelphia & New York as chief engineer, which position he held until he became vice-president and general superintendent of the Western Maryland on January 14, 1874. On March 24, 1874, he was made president and general manager of the latter road, which office he held until July 8, 1902.

Financial News

Augusta Winthrop & Gardiner Railway.—It is reported that an arrangement has been made by which this road is to be purchased by the syndicate headed by John R. Graham, of Bangor, Me., which owns the Lewiston Brunswick & Bath Street Railway and the Bangor Railway & Electric Company. Thomas J. Lynch is president. It is stated that if the deal is accomplished the syndicate has plans for the construction of 50 miles of new road next year, including a line from Augusta to Winslow, and one connecting with the Lewiston Brunswick & Bath at Sabattus.

Aurora Elgin & Chicago Railway.—The gross earnings for the month of November were \$96,722, compared with \$89,415 in 1905. Net earnings for the month were \$39,904 and surplus \$13,745, against \$37,835 and \$13,355 for November, 1905.

Buffalo & Lake Erie Traction Company.—This company, a consolidation of the Sheehan-Mayer roads between Buffalo and Erie, the Buffalo Dunkirk & Western Railroad, the Dunkirk & Fredonia Railroad and the Lake Erie Traction Company, has filed a mortgage for \$12,000,000 to the New York Trust Company.

Chicago, Ill.—The case of Lobdell against the city of Chicago, in which the plaintiff, said to represent the Chicago traction interests, questions the constitutionality of the Mueller law, providing for an issue of \$75,000,000 of certificates to enable the city to purchase the street railway system of the city, was submitted before the supreme court of Illinois at Springfield on December 22 and taken under advisement by the court. Harry P. Weber, who appeared for the plaintiff, argued that the ownership of street railways was not a municipal purpose; that the Mueller law was a local or special law; and that the certificates would constitute a debt of the city beyond the constitutional limit. Walter L. Fisher appeared for the city to defend the law.

Chicago-New York Electric Air Line Railroad (Portland, Me.)—This company, which is promoting an electric railway from Chicago to New York, has filed notice of an increase of its capital stock to \$5,000,000 to \$25,000,000.

Cincinnati Toledo & Detroit Short Line Railway.—The application of Ella Buxton, a stockholder, for the appointment of a receiver has been denied by Judge Kincaide, of the common pleas court at Toledo. The court found nothing in the evidence to sustain the charges of mismanagement.

Cleveland & Southwestern Railway.—The reorganization committee of the Cleveland & Southwestern Traction Company has decided upon a comprehensive merger of the three interurban properties controlled by the Pomeroy and Mandelbaum interests in northern Ohio and the plans have been approved by the directors. The merger will include 210 miles of single track and will bring lines reaching from Cleveland to Norwalk, Wooster, Wellington, Ashland, Mansfield, Galion and Bucyrus and including intermediate towns such as Elyria and Oberlin, into one large system. The roads involved are the Cleveland & Southwestern Traction Company, 135 miles; the Cleveland Ashland & Mansfield Traction Company, 43 miles now building, and the Ohio Central Traction Company, 29 miles. The new company will take the name of the Cleveland & Southwestern Railway Company. It will have \$10,000,000 capital stock, of which \$2,500,000 will be 5 per cent cumulative preferred and \$7,500,000 common. The authorized bond issue will be \$10,000,000. Of the above capital \$5,000,000 in bonds will be issued, together with \$2,400,000 in preferred and \$4,700,000 common stock, to take care of the exchange of securities in the present companies, and the balance of \$5,000,000 in bonds, \$100,000 in preferred and \$2,800,000 common stock will remain in the treasury for the purpose of acquiring new lines and improvements to the property.

Columbus Railway & Light Company.—It is expected that the annual report to be submitted at the annual meeting of the stockholders of the Columbus Railway & Light Company January 29 will show that the receipts of the Columbus Railway Company for the year have reached \$1,750,000. If the final results bear out the expectations, this will mean that the company will have to sell eight tickets for 25 cents instead of seven. There is a provision in the blanket franchise granted the company several years ago that when the receipts of the railway company in any one year have reached \$1,750,000 it shall sell eight tickets for 25 cents. The annual meeting of the Columbus Railway Company will be held on January 10, but all matters of importance will be referred to the meeting of the Columbus Railway & Light Company on January 29.

Evansville & Southern Indiana Traction Company.—This company, which has taken over the Evansville Princeton & Vincennes Interurban Railway, has elected the following officers: President, James Murdock, of Lafayette, Ind.; vice-president, Henry Smith, Hartford City, Ind.; secretary and treasurer, Charles Murdock, Lafayette; general manager, R. R. Smith.

Frontier Electric Railway.—The New York railroad commission has granted this company, which proposes to build an electric railway from Buffalo to Niagara Falls, N. Y., for the International Railway, of Buffalo, permission to increase its capital stock from \$300,000 to \$1,500,000, and to issue a mortgage of \$2,000,000.

Hudson & Manhattan Railroad.—This company has been formed as a consolidation of three companies which are building tunnels under the Hudson river between New York and Jersey City—the New York & Jersey Railroad Company, the Hudson & Manhattan Railroad Company and the Hoboken & Manhattan Railroad Com-

pany. The Hudson & Manhattan Railroad and the Hoboken & Manhattan Railroad were consolidated last week under the name of the Hoboken & Manhattan Company with a capital stock of \$38,500,000. It is now stated that this merger was only a preliminary step in the formation of the larger company. The Hudson & Manhattan Railroad Company will have a capital stock of \$50,000,000 of which \$10,000,000 will be five per cent non-cumulative preferred stock. The officers are Wm. G. McAdoo, president, Frederick B. Jennings, vice-president and C. W. King, secretary and treasurer, with offices in both New York and Jersey City.

Interborough-Metropolitan Company.—D. W. Burrows, of Chicago, has brought suit in the United States circuit court at New York asking to have declared void the formation of the Interborough-Metropolitan Company last January by the merger of the Interborough Rapid Transit Company, the Metropolitan Street Railway Company and the Metropolitan Securities Company. The plaintiff alleges that as a result of the consolidation his 1,400 shares of stock of the Metropolitan Securities Company became valueless.

Macon Americus & Albany Electric Railway.—The Interurban Construction Company and the Macon & Albany Securities Company have been organized and chosen headquarters in the Grand building, Macon, Ga. The Interurban Construction Company is headed by W. Jordan Masee, president. This company will have charge of the engineering for the proposed line between Macon, Americus and Albany. The Macon & Albany Securities Company, which will handle the finances, is headed by Nicholas J. Cruger, Albany, Ga., president.

Milwaukee Electric Railway & Light Company.—President John I. Beggs has given a sworn statement that the gross earnings for the 12 months ended on November 30, 1906, were \$3,494,838, of which \$546,722 was derived from the lighting business. The gross receipts of the subsidiary suburban company, the Milwaukee Light Heat & Traction Company, were \$694,180. The mileage of the Railway & Light company in Milwaukee, East Milwaukee, Whitefish Bay and Wauwatosa is given as 116.22 miles. The Traction company has 142 miles. The taxes on the two companies, 5 per cent of the gross receipts, were \$174,742 and \$34,709.

Pennsylvania & Maryland Street Railway.—The Somerset County Street Railway and the Pennsylvania & Maryland Street Railway, which was incorporated in July to build 30 miles of electric railway in Somerset county, Pa., have been consolidated under the name of the latter. Capital stock \$410,000.

Peoria Bloomington & Champaign Railway.—This company, a part of the Illinois Traction System, has filed a mortgage to the Central Trust Company, of Chicago, to secure an issue of \$3,000,000 30-year 5-per cent bonds, of Chicago, to secure an issue of \$3,000,000 line between Peoria and Champaign, Ill.

Rock River Traction Company.—The stockholders have authorized an issue of \$2,000,000 of bonds for the purpose of constructing an electric line from Sterling to Rock Island, Ill.; from Rock Island to Geneseo and Princeton; and from Sterling to Morrison, a total distance of 125 miles. F. E. Andrews, vice-president, Sterling, Ill.

Rome (Ga.) Railway & Light Company.—The directors of this company, a reorganization of the Rome Traction Company, have authorized an issue of \$500,000 30-year 5 per cent bonds, of which \$300,000 will be used to retire bonds of the old company and the remainder for improvements and extensions, including a line from Lindale to Boozeyville. S. S. Busch, Louisville, Ky., general manager.

Southwestern Traction Company.—It is rumored that the Detroit United Railway will absorb this company, which operates a line from London to St. Thomas, Ont., and is constructing extensions. F. G. Rumball, London, Ont., is president.

Springfield & Xenia Transit Company.—The receivership of this company was terminated on December 18 when the common pleas court at Springfield, O., affirmed the report of the receiver, Fred J. Green. The property was purchased some time ago by a committee of the bondholders. It is stated that a new company will be incorporated.

Stuebenville & East Liverpool Traction & Light Company.—This company has increased its capital stock from \$5,000 to \$3,800,000.

Toledo & Western Railway.—Judge R. W. Taylor, of the United States circuit court at Toledo, O., has confirmed the sale of the Toledo & Western Railway at auction to J. R. Nutt, of Cleveland for \$344,759.

United Railways of St. Louis. This company on January 1 formally took over the property of the St. Louis & Suburban Railway and that system is now operated as a part of the United Railways System, transfers being exchanged between the lines. General Manager Herbert McCulloch has had his jurisdiction extended over the Suburban system succeeding Julius H. Walsh, Jr. The Suburban stockholders receive 40,000 shares of United preferred stock. The United Railways now controls practically every street railway line in St. Louis and vicinity, including 473 miles of track and 1,600 cars. Its capital stock is \$45,000,000 and the bonds outstanding aggregate \$51,900,000. John L. Beggs, of Milwaukee, is president.

Western New York & Pennsylvania Traction Company.—A certificate has been filed showing that this company, recently incorporated in Pennsylvania with a capital stock of \$2,000,000, has effected a consolidation of the Olean (N. Y.) Street Railway and the Bradford (Pa.) Electric Street Railway. Wilson R. Page of Olean is president.

Manufactures and Supplies

ROLLING STOCK.

Marcellus & Otisco Lake Railway, Marcellus, N. Y., is in the market for a passenger coach.

Pennsylvania Railroad is reported in the market for 50 new cars for use on the West Jersey & Seashore Railroad.

American Railway, Philadelphia, has ordered ten double-truck cars from the Jewett Car Company.

Virginia Passenger & Power Company, Richmond, Va., is receiving the first of an order of 20 semi-convertible cars.

Middletown & Cecilton Railroad Company, Middletown, Del., expects to place orders for new equipment in February, 1907.

Toronto Railway, Toronto, Can., is reported to have ordered 15 new cars and to be in the market for 40 additional.

Toronto & York Radial Railway, Toronto, Ont., is having a number of cars built at the shops of the Toronto Railway Company.

Indianapolis & Louisville Traction Company, It is reported, will order three cars at an early date. John E. Greely, Jeffersonville, Ind., is interested.

Whatcom County Railway & Light Company, Bellingham, Wash., is in the market for two closed single truck cars 31 feet over all for city service.

Elmira Water Light & Railway Company will probably place orders for two 15-bench open cars for spring delivery and is rebuilding a number of its cars.

Inter-Urban Railway & Power Company, Hot Springs, Ark., expects to purchase during 1907 eight combination cars to be 55 feet over all for interurban service.

Indianapolis Columbus & Southern Traction Company, Columbus, Ind., has ordered 3 combination cars 50 feet long over all from the Niles Car & Manufacturing Company.

Winnipeg Electric Railway, Winnipeg, Can., has 25 new cars under construction. Ten of these are under construction at the company's shops and the balance in contract shops.

Owosso & Corunna Electric Company, Owosso, Mich., has been reported to be considering additional car equipment. We are advised that an order may be placed early in 1907.

Savannah Electric Company, Savannah, Ga., will build four open trailers, 40 feet long over all, for suburban service in its shops. The cars are to be equipped with two G. E. 67 motors each.

Indianapolis Newcastle & Toledo Electric Railway, Newcastle, Ind., has ordered 3 interurban coaches and 2 express cars from the Jewett Car Company. Electrical Installation Company, Monadnock block, Chicago, are engineers in charge of construction.

Indianapolis Crawfordsville & Western Traction Company, Indianapolis, Ind., has ordered eight double truck passenger cars 57 feet 8 inches over all for high-speed interurban service and also two 60-foot express cars. The cars are to be equipped with Baldwin trucks.

Lake Shore Electric Company, Cleveland, O., has 15 cars under order with the Niles Car & Manufacturing Company for February and March delivery. Ten of these will be 51-foot coaches with double trucks and live combination passenger and baggage cars of the same dimensions.

SHOPS AND SHOP EQUIPMENT.

British Columbia Electric Railway.—A contract has been let for the construction of additional car barns at Vancouver, B. C.

Indiana Union Traction Company.—A general contract for the new car barns and shops at Anderson, Ind., has been let to Sheperdson & Hawkins, of Anderson. The buildings are to be completed by July 1, 1907, at an estimated cost of \$160,000.

International Railway Company (Buffalo, N. Y.)—This company has decided to erect a brick car barn on Broadway near Bailey avenue in Buffalo. The building will be of brick, 660 feet long by 164 feet wide, and will have a capacity for 200 cars. Ground will be broken in the spring.

Los Angeles Railway.—This company is now building and expects to occupy about February 1 a large new car house on Avenue 28, Los Angeles, Cal. The building is of brick, 600 feet by 150 feet, containing 3,000 feet of track under cover with storage room for 250 cars. Two cross-over tracks make a connection with the main line of the Eagle Rock Valley division. H. E. Huntington, general manager, Los Angeles.

Omaha & Council Bluffs Street Railway.—It is reported that this company will build eight cars at its shops in Omaha and that if the experiment proves successful it will build additions to its shops, install new machinery and in the future build all its own cars.

Portsmouth (O.) Street Railroad & Light Company.—The company is planning for the construction of a car house and machine shop during the next year. It is expected the new buildings will occupy ground at the western terminus of the company's line, where a large tract of land is owned by the company.

TRADE NOTES.

Edward Morris Lara, who was until recently associate editor of the Electric Railway Review, has taken a position with Keuffel & Esser Company, New York, in the publicity department.

Missouri Central Railroad, New Florence, Mo., is in the market for immediate purchase of a short abandoned railroad of about seven or eight miles in length together with rails, ties and rolling stock. The company is also desirous of obtaining at once a dummy or gasoline engine capable of handling two or three cars of standard gauge.

Lunkenheimer Company of Cincinnati, Ohio, has purchased for its works there seven 60-cycle induction motors ranging in size from 7½ to 15 horsepower to be used in driving machinery for the manufacture of valves and other high grade engineering specialties. These motors will be built by Allis-Chalmers Company at its Cincinnati works.

Aaron Dean, Jr., heretofore resident manager of the western district of the Federal Railway Signal Company with headquarters at Chicago, has been made chief engineer of the Federal Railway Signal Company with headquarters at its works, Troy, N. Y., in place of P. G. Ten Eyck, who was recently appointed general manager of the company at Troy. W. W. Lavarack, assistant to the president, will succeed Mr. Dean with headquarters at Chicago in charge of the Western district of the company.

Frank H. Taylor, who has been elected a director and vice-president of the Yale & Towne Manufacturing Company, was born in Cincinnati, O., and was graduated from Haverford college. He later entered Harvard University from which he was also graduated, receiving the degree of A. B. with the class of 1877. In 1882 Mr. Taylor moved to Philadelphia where he assisted in the organization and became treasurer of the Belmont Iron Company of which he ultimately became president. In 1890 he accepted the position of manager of the Philadelphia branch of the Yale & Towne Manufacturing Company which position he retained for seven years. In 1897 he was appointed sales manager of the Westinghouse Electric & Manufacturing Company, serving in that position for three years, following which he was elected second vice-president of the company, resigning the position in April, 1906. As vice-president of the Yale & Towne Manufacturing Company Mr. Taylor's duties will relate to the manufacturing and sales departments of the business and will ultimately include many of the matters which have heretofore been handled by the president. The present official organization of the Yale & Towne Manufacturing Company, is as follows: President, Henry R. Towne; vice-presidents, Schuyler Merritt, Frank H. Taylor; treasurer, A. R. Erskine; general manager, Kirk Brown; general superintendent, Walter C. Allen.

J. W. Duntley, president of the Chicago Pneumatic Tool Company, Chicago, noted in the columns of this paper some time ago as sailing for Europe in behalf of the company, has just returned from a six-weeks' tour in that country. Mr. Duntley reports that the pneumatic tool business abroad has shown an increase during the past year of between 25 and 30 per cent over any previous year. The products of this company have been installed in the shops of practically all foreign railways as well as larger industrial institutions and government ship yards, enjoying a large per cent of the pneumatic tool business in foreign countries.

Edison Electric Company of Los Angeles, Cal., has ordered for its hydro-electric plant on the Kern river, at Edison, Cal., eight Allis-Chalmers direct-current motors with controllers and gearing equipments, to be used for operating 28-inch gate valves. The motors will be 120 volts, series wound, machines of the vertical shaft type, fully enclosed, and especially adapted to the service required. This company has installed on the Kern river at Caliente five 3,200-kilowatt Allis-Chalmers alternating current generators direct connected to Allis-Chalmers hydraulic turbines, forming one of the largest long distance transmission plants on the Coast.

Electric Service Supplies Company announces that it has secured in addition to its former territory, the states of Michigan, Ohio and Indiana for the complete line of Locke insulators manufactured by the Locke Insulator Manufacturing Company, of Victor, N. Y. This company has experimented with insulators under all conditions until it now believes that both the electrical and ceramic qualities of its product are as near perfection as possible. Particular attention has been given to the effect of atmospheric moisture and temperature on the efficiency of insulation at high voltages; to the development of neutral colored glazes as the least conspicuous for insulators, and in the matter of provid-

ing large factors of safety in designing supports and insulation for transmission lines.

D. E. Baxter & Co., Incorporated, 27 William street, New York, has placed an order with S. L. Benz, of Pittsburg, Pa., for 76,000 cross-ties to be 7 by 8 inches by 8 feet long and for 900 poles 30 feet in length and having a diameter of 7½ inches at the small end, for immediate delivery at Charleston, S. C.

Chase-Shawmut Company, Newburyport, Mass., reports an order from the Northern Electric Company, of Chico, Cal., for 138,855 of its Shawmut soldered rail bonds, which in connection with two previous orders makes the total number of bonds ordered by this company 243,355. The type of bonds used are a 400,000 circular mils Type A for the third rail and a 200,000 circular mils Type B B bond for the track. The installation of these bonds is being superintended by the Chase-Shawmut Company.

B. F. Sturtevant Company, Boston, Mass., reports rapidly increasing sales of enclosed forced lubrication engines. Among these may be mentioned C. H. Mears & Co., Chicago, Ill.; Old Dominion S. S. Company, Norfolk, Va.; Swedish Hospital & Nurses' Institute, Minneapolis, Minn.; Belmare Manufacturing Company, Canton, Pa.; Phoenix Woolen Company, Stafford, Conn.; Hoopes & Townsend Company, Hoopston, Pa.; Manufacturers' Furniture Exchange, Chicago, Ill.; Silver Brothers Iron Works Company, Salt Lake City, Utah; Burgess Mills, Pawtucket, R. I.; Narragansett Mills, Fall River, Mass.; U. S. Navy Yard, Washington, D. C.; Henry Steers, Inc., New York City; and G. H. Breyman & Bros., Boston, Mass.

Roberts & Abbott Company, engineers, Cleveland, O., has found it advisable, due to its increasing work in the west, to provide facilities for handling the work to better advantage by establishing an office at Chicago, and W. D. Ball, E. E., has been placed in charge of the work there with headquarters in the First National Bank building. Mr. Ball has been connected with a great deal of electrical and civil engineering work, principally for trolley railways and hydraulic plants and was one of the United States government's representatives at the Paris Exposition in 1900. The efforts of the Chicago office will be along the same lines on which the Roberts & Abbott Company has specialized, namely, interurban railways and hydraulic plants.

ADVERTISING LITERATURE.

The Arnold Company, 181 La Salle Street, Chicago, Ill.—Bulletin No. 16, descriptive of the Sedalia shops of the Missouri Pacific has recently been issued by this company.

J. H. Wagenhorst & Co., Youngstown, O.—An illustrated folder calls attention to electric blue printing machines manufactured by this company and presents a list of the more prominent users of the machines.

Nernst Lamp Company, Pittsburg, Pa.—An attractive little pamphlet describes the architecture of the New York terminal of the Pennsylvania and calls attention to the manner in which it is to be lighted.

Dayton Pneumatic Tool Company, Dayton, O.—A flat vest pocket lead pencil encased in celluloid with gold tipped ends and an eraser calls attention to the pneumatic hammers manufactured by this company.

Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 1503 describes Allis-Chalmers direct-connected Reynolds-Corliss engines with a number of engravings from photographs showing complete engines and various parts.

Sprague Electric Company, New York.—Electric hoists and cranes are described in a 14-page leaflet with illustrations showing many combinations of its hoists, carriages and cranes. The pamphlet calls attention to Hoist Catalogue No. 220, which is a complete catalogue of the company's manufactures.

F. W. Bird & Son, East Walpole, Mass.—"First Expedition to Cuba" is the subject of a blotter in two colors which refers to a large order for Paroid roofing which has been received by the company to cover buildings at Newport News, Va., from which point the first expedition to Cuba recently started.

Newman Clock Company, Chicago.—As a souvenir of the recent street and interurban conventions at Columbus, this company is mailing a handsome half-tone panorama view of the Ohio state fair buildings suitable for framing, accompanied by another engraving showing the company's booth at the conventions.

Joseph Dixon Crucible Company, Jersey City, N. J.—"Air Compressor Lubrication" is the subject of a 24-page pamphlet issued by this company. It calls attention to the necessities of proper lubrication for air compressors, quoting a number of authorities, and then describes various methods of successful lubrication.

D & W Fuse Company, Providence, R. I.—Catalogue No. 12 of this company is a complete compendium of fuse material with all necessary information on cartridge fuses and safety devices for lighting, heating, power, railway, signal, telephone and telegraph circuits. It is a 90-page publication fully illustrated with engravings and complete with various tables.

Wellman-Seaver-Morgan Company, Cleveland, O.—This company is a stock company incorporated under the laws of Ohio for the purpose of transacting a general engineering and manufacturing business. A pamphlet issued by it calls attention to the general classes of work to which the company devotes attention and shows a number of interesting views of machinery and plants which have been designed and installed by it.

Frank H. Taylor.

"TRANSITE" ASBESTOS DOORS.

The great danger attending the handling of high-tension currents makes necessary some suitable provision for preventing persons coming into contact with the apparatus, as well as for protecting the latter from short circuits between adjacent parts. In modern transformer stations a very efficient and satisfactory method of protecting high-tension transformers and switches is to surround them with brick walls, in front of which movable doors made of "Transite" asbestos fireproof lumber are placed, as here shown. These doors are absolutely fireproof and will prevent danger to both persons and property.

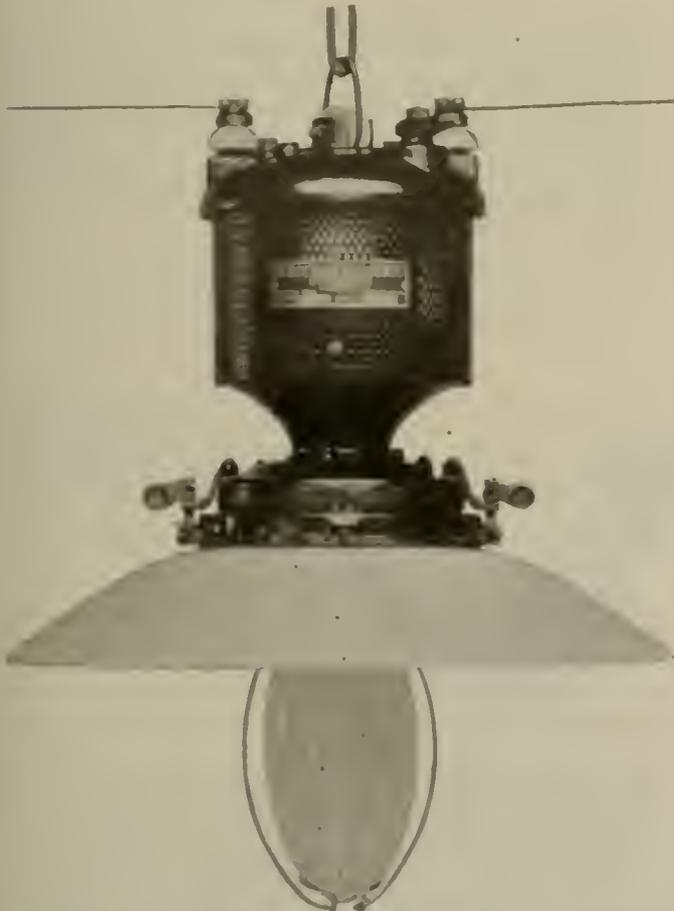

"Transite," which is manufactured by the H. W. Johns-Manville Company, of New York, is a fireproof sheathing, the basis of which is asbestos fiber. It is mechanically much stronger than ordinary asbestos board, and has a density which makes the finished material practically non-absorbent, and possessed of the very highest heat-resisting properties. It will stand much rougher usage than slate, being harder and tougher and not so brittle. This material is extensively used in various ways about electric light and power plants, owing to its high efficiency, durability and the fact that it is very easily worked, being cut, nailed or screwed, very much the same as ordinary lumber.

Asbestos Door.

NEW ARC LAMP FOR LOW CEILINGS.

The accompanying illustration is a view of a newly designed short lamp, adapted for 110 or 220 volts, direct current, which possesses many features of excellence in design, material and workmanship. The efforts of manufacturers to produce a lamp adapted to low ceilings have resulted heretofore in a lack of sym-

Arc Lamp for Low Ceilings

metry of design and compactness. In the new lamp which is now being sold by the Western Electric Company the overall length has been reduced to but 20 inches from the top of the lamp to the lower end of the enclosing globe. This feature of shortness is obtained without reducing the length of the carbon in any appreciable manner, thereby cutting down the life and under that given by an ordinary incandescent lamp. A life of 100 hours with each tripping is guaranteed. Instead of the large bulk case, this lamp is reason-

able of the use of indestructible windings and specially designed resistance units, is of very small dimensions and quite symmetrical in design.

Special attention has been paid in the construction of this lamp to secure adequate ventilation, while at the same time protecting the regulating mechanism from harmful accumulations of dust. Such lamps are often placed in basements and low rooms, such as boiler and engine rooms, where the heat is often excessive, and their design has been with special reference to such service. In the choice of materials for the different parts, only those that have been found best adapted for the purpose have been made use of, regardless of cost, and this fact, the manufacturers claim, combined with excellence of workmanship and care as to the accuracy of detail parts, has produced a lamp which can be relied upon for years of service with but little expense for maintenance.

It is found quite difficult in practice to apply any effective safeguards against injury to lamps of this type as ordinarily constructed, by the use of fuses, and it has frequently been found that lamps which were thought to be well protected have been practically destroyed by excess currents. In the new lamp, provision is made to preserve the lamp absolutely from injury, even where fuses are entirely omitted, and the lamp may stand with the arc short-circuited for hours without material injury and will be found ready for normal operation the moment proper conditions are restored.

250-VOLT INDICATING PLUG FUSE.

The D & W Fuse Company, Providence, R. I., has introduced a 250-volt plug cut-out fuse of the Edison type which embodies the merits of its cartridge type fuses, including the bullseye indicator. Heretofore the construction of the plug fuse has been such that it was impossible to determine whether the fuse had been blown without testing the circuits, but with the new type a blown fuse is detected at a glance by the appearance of the "bullseye" on the label.

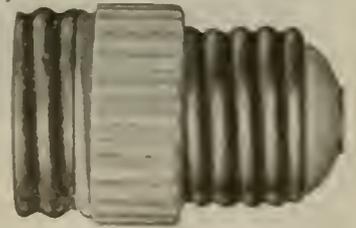

Figure 1.

Figure 1 gives a full-size side view of the fuse. Figure 2 is an end view showing the appearance of the label before the blowing of the fuse, and Figure 3 shows the same fuse blown, as indicated by the black spot in the bullseye.

Figure 2.

Figure 3.

The fuses may be renewed by returning to the factory, and have been approved by the National Board of Underwriters.

CHICAGO ELECTRICAL EXHIBITION.

The second annual electrical show of the Chicago Electrical Trades Exposition will be held at the Coliseum in Chicago, January 18-26. Every branch of the electrical field will be represented and it is expected that this will be one of the most complete exhibitions of electrical devices ever held in America, far surpassing both in the number of exhibitors and the number and variety of displays the successful exhibition of last year.

Managing Director Homer E. Niesz has announced the following special days: Monday, January 14, formal opening, Wednesday, Thursday and Friday, January 16, 17 and 18, annual convention of the Northwestern Electrical Association, with both afternoon and evening sessions, Thursday January 17, Ben Franklin Day, Friday, January 18, meeting of the Illuminating Engineering Society, Monday January 21, Telephone Day, Tuesday, January 22, Rejuvenation of the Sons of Love, Wednesday, January 23, Thomas A. Edison Day, Thursday, January 24, meeting of the American Electrical Stationers' Association.

One of the features of the show will be the "Electric Midway," for which the main floor of the Coliseum Annex will be divided into four small theaters. One of these will be devoted to new developments with static apparatus and high and low frequency current by Prof. W. J. Clark. Another theater will have a new electrical and mechanical creation called the "Aurora Research," which will show beautiful lighting effects, as arranged by Mr. Edgar Healy, of Chicago. In the third theater will be an electrical musical act. It is announced that a new storage battery which has just been perfected by Mr. Thomas A. Edison will be exhibited and demonstrated for the first time.

Thirty thousand square feet of space 30 per cent more than

last year—has been sold for general exhibits on the main floor of the Coliseum. Encouraged by the interest the trade and the public took in last year's show the exhibitors are planning to put more money and effort into their displays. The list of exhibitors numbers nearly 200.

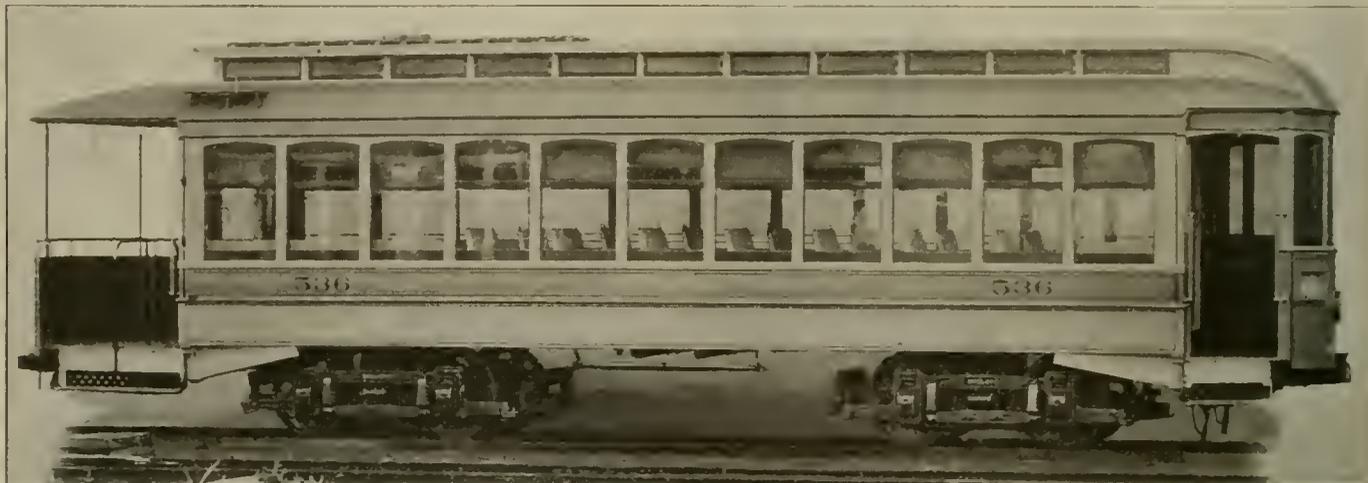

The Electric Railway Review will be represented at Space 6, Section D, and will be pleased to receive calls from any of its friends who are attending the exhibition. The more interesting exhibits include the following:

The Electric Service Supplies Company, Space No. 13, will exhibit the automotoneer and other patented devices together with lighting and railway materials and supplies.

The Ohio Brass Company, Space No. 7, Section D, will exhibit

NEW SEMI-CONVERTIBLE CARS FOR TOLEDO.

The illustration shows one of 20 cars which were recently delivered by the G. C. Kuhlman Car Company to the Toledo Railways & Light Company. The new cars are generally similar to the advance lot of 10 cars for this company shipped by the same builders at the beginning of last year. Their construction includes the Brill grooveless-post semi-convertible window system as well as other specialties. As will be noted from the two types of platforms these cars are for operation in one direction only. The front platform contains the motorman's compartment, which is formed by the conjunction of two hinged doors extending diagonally across the car. The entrance from the platform to the

Type of Semi-Convertible Car for Toledo.

overhead electric railway supplies, and a full line of rail bonds and third-rail insulators.

The Joseph Dixon Crucible Company, Space No. 4, Section A, will exhibit a full line of the Dixon graphite products and will entertain its visitors in the "laughing gallery," which was a feature of the exhibit at the Columbus convention of the American Street and Interurban Railway Association.

The Western Electric Company will show a very large and handsome watercolor view of its new 110-acre plant at Hawthorne, Ill. The exhibit will include American transformers, Thomas high-tension insulators, electro-insulating material, arc lamps and direct-current motors, with a series of alternating equipment in full operation.

At the exhibit of W. N. Matthews & Brother may be seen the Lima jack box. The boxes are to be installed on poles along the line of the railway and connected with the regular telephone wires. Each train crew is provided with a portable telephone and a plug which makes connection with the box so that the dispatcher may be reached quickly.

The engineering department of the National Electric Lamp Association will have an interesting exhibit of the latest achievements of electric lamp makers, including "Tantalum," "Tungsten," metallized and ordinary carbon filament lamps.

The Ft. Wayne Electric Company has installed a generating set of 150-kilowatt capacity to furnish all the electrical energy for exhibitors. The company's regular exhibit in Space No. 13 is a complete working demonstration of the series alternating-current arc-lighting system of 25-light capacity; also the company's standard line of wattmeters and prepayment devices.

The display of the Vulcan Electric Heating Company will include various small electric heating devices such as soldering tools, branding appliances and electric household appliances.

The Bishop Gutta Percha Company, New York, will show the same exhibit which received a gold medal at the Centennial Exposition in Philadelphia, in 1876, as well as several interesting electric devices for household purposes.

Central station men and owners of buildings requiring elevator service will be interested in the working single-phase electric motor shown by the Wagner Electric Manufacturing Company in Space 10, Section D. This company is also showing a novel little instrument which indicates the cost of operation of electric lamps, curling irons, chafing dishes, etc.

H. F. Vogel Contracting & Railway Supply Company has been incorporated in Missouri with a capital of \$5,000. The officers of the company are H. F. Vogel, president; Nic Le Grand, secretary and treasurer. The new organization succeeds H. F. Vogel & Co., whose offices are at 420 Rialto building, St. Louis.

passenger compartment is through a door of the Brill "semi-accelerator" pattern; its location at the side rather than in the center of the bulkhead makes access to the car more convenient for passengers. The platform is of the familiar "Detroit" type. The interior finish is cherry. The dimensions are: Length over end panels, 30 feet 8 inches; over vestibules, 40 feet 8 inches; width over sills including sheathing, 7 feet 11½ inches; over posts at belt, 8 feet 2 inches; height from floor to ceiling, 8 feet 4½ inches; from track to under side of sills, 2 feet 8¾ inches; size of side sills, 4 inches by 7¾ inches; end sills, 5¼ inches by 6¾ inches. The car bodies are mounted on the Brill No. 27-F1 truck with a wheel-base of 4 feet 6 inches.

THE CLARK SOLDERED RAIL BOND.

The illustration shows a new soldered rail bond patented by Mr. Walter G. Clark, of the Clark Electric & Manufacturing

The Clark Soldered Rail Bond.

Company. Although the desirability of using soldered rail bonds has long been recognized, serious difficulty has been met in soldering the bond properly to the rail and in the tendency of the bond to peel off, caused by the difference in the coefficients of expansion of the steel and copper. Mr. Clark, after many experiments, found that if the terminals were made sufficiently thin the copper would expand and contract without this tendency to peel. He also found that if the bond terminal were provided with openings for the admission of solder and the escape of gas, the solder would flow well between the rail and the bond terminal and unite the rail and the bond perfectly. As shown in the illustration Mr. Clark's bond is made with perforated terminals to permit the gases from the flux or soldering salts to escape and enable the solder to flow well under the bond. The terminals are also increased in area and reduced in thickness to a point where the expansion and contraction do not loosen them from the rail. This bond is manufactured by the Clark Electric & Manufacturing Company, 135 Broadway, New York.

Last week we announced that the Electric Railway Review had become a weekly publication. This week we are pleased

to announce a change of address. The

New Offices for the Review. general offices of the Electric Railway Review will be moved this week to the eleventh floor of the new Patten building, 160 Harrison street, Chicago, where we shall have most commodious offices in which we shall always be glad to receive our friends.

The Wisconsin railroad commission is in a quandary as to how to deal with the electric railways. Under the Wisconsin

State Control of City Lines. law, as construed by the attorney general and by the commissioners, they have the power to regulate any street railway company whose lines pass beyond the limits

of the city in which it is operating. This right of regulation extends to the urban business of the company as well as to its business outside of the city limits. As a result the commission appears to have a right to regulate the entire business of a street railway where any of its lines extend beyond the city limits, but it has no control over a company whose lines are entirely within the limits of the city in which it is operating. In its last annual report to the governor the commission recommended that its jurisdiction be either increased or diminished so that it shall either have power over the business of all street railways operating in the state or that such power shall not extend to any of them. Other states are facing the same and other similar problems. In Ohio the commission is in some doubt as to its control over city lines. According to the law creating the commission, "street and electric railways engaged solely in the transportation of passengers within the limits of cities" are without its jurisdiction. A universal principle is at the root of the whole matter; the laws are always a little behind the times. But at the rate at which the electric railways are forcing themselves to the front it should not be long before the attention of the law-makers is suf-

ficiently attracted to the inconsistency of the present situation to effect the required changes.

A good method of handling what is frequently one of the most difficult features of association work destined to be performed by committees was pursued at a recent meeting of the executive committee of one of the railway associations. It was taken up in pursuance of a design to make some one definitely responsible for certain work. The plan consists simply in assigning to each member of an executive committee a certain portion of the work which it is expected will be performed by other individuals or committees outside the executive committee. In other words, a subject for a paper or a report is assigned to each member of the executive committee. It is his work to get the proper person or persons to produce the actual result. In case of negligence or failure he is placed in the unfortunate position of being obliged to explain his delinquency and this reflects upon his capacity as an executive officer. This appears to be a much better plan than that of using an executive committee solely for the purpose of unthinkingly ratifying the work of a president and secretary.

The paper on "Gas Engines" presented at the last meeting of the American Street and Interurban Railway Engineering Association by Paul Winsor of the Boston Elevated Railway, was so valuable a contribution to the somewhat meager literature of this subject, that those interested

Further Consideration of Gas Engines. in this form of prime mover will be glad to know that Mr. Winsor will follow at the next annual meeting with an account of the operation of gas engines during a longer period of use. This will be particularly valuable in the direction of accurate data, since Mr. Winsor has discovered that on account of the brief time for preparation some errors crept into his original paper. These will, however, be corrected in the printed proceedings of the meeting. The record of coal consumption is said to have been made to

appear too favorable to the gas engine and as this is one of the chief points of interest in the whole consideration the correction will be valuable as placing the facts on a basis of accuracy. A full year's experience, also, upon which Mr. Winsor will base his second paper, should furnish data upon which far more reliable conclusions may be predicated than was possible upon a limited experience of four weeks.

In the Electric Railway Review for August, 1905, some editorial consideration was given to the tenacity with which the "one-ride, one-fare" idea holds its place

Ten Cents for a

Ten-Cent Ride.

in the public mind with relation to electric railways. The case in point was the contention of citizens of the borough of Brooklyn that because a single system of railways had superseded the several lines formerly connecting Brooklyn and Coney Island, passengers should be carried by the Brooklyn Rapid Transit Company, the existing company, between these points for a single five-cent fare. In an attempt to enforce this demand, rioting occurred, hundreds of persons were injured and at least one life was lost as an indirect result of the disturbance. The contention has now been settled in the courts with such unanimity and definiteness that the incident may be considered closed and the citizens of Brooklyn will continue as before, but without rebate certificates, to pay for services rendered. But probably the most wholesome lesson that can be drawn from the whole circumstance is the folly of accepting as a finality upon which physical violence is justifiable the opinion of a petty judicial officer upon an incomplete statement of facts, which opinion could at best be classed only among obiter dicta—the whole trouble having arisen from a statement of Justice Gaynor that the Brooklyn Rapid Transit Company had no legal right to exact more than one five-cent fare for a ride to Coney Island and that persons resisting its collection would not be liable to arrest. The attitude of the railway company has been distinctly tolerant and was based upon a firm conviction of its moral and legal rights. Pending the decision of the case certificates have been issued to payers of the ten-cent fare which, in case of a decision against the company, would have been honored as rebates. These are now valuable only as waste paper unless they are preserved as mementos of one or two lessons such as have here been pointed out.

The valuable claims made for regenerative braking include the assertion that under no circumstances will it lock the car wheels; if the connections are out of order it cannot be moved; it is not dependent upon the continuity of the supply circuit and the more the regenerative feature is called into play the less will be the proportionate amount of current required for operation. Some official tests made last year showed that similar two-motor cars, one equipped with regenerative motors and one with series motors, each traveling 44.18 miles, showed a saving of 24 per cent in favor of the regenerative car. Other comparative tests showed percentages of 26.7 and 28.7, with exactly similar cars in actual service. In discussing this paper as read several operators using the regenerative system introduced points of interest. The fact that a car did not accelerate when it got over the brow of a hill was thought to be a strong point as regards safety, and when descending very steep hills the regenerative effect gave the motorman every confidence, as on descending the controller was not switched off, but kept on the running notches according to the speed required. The motors were found to have a slightly higher heating than the ordinary series parallel type. One road operating a considerable number of cars had not experienced any serious armature troubles and never a burnout. The adjust-

ment of brakes on the ordinary car had to be carried out on an average of once every day, but on the cars fitted with regenerative control, while they were examined every day, adjustments were necessary but about once a week. Considerable economy was shown in the matter of brakeshoes. The extra cost for a regenerative equipment over a standard type on a two-motor city car was stated as approximately \$200. While these advantages are striking ones it must yet be remembered that a motor for regenerative control has not gone through a serious process of design. All the motors considered by the author in obtaining the results described were series motors with the series coils changed for shunt coils.

An important topic to be presented for consideration at the next annual convention of the American Street and Inter-urban Railway Engineering Association, as determined upon at the meeting of the executive committee held in New York on January 7, is that of "Open versus Closed Terminals with Reference to Effect Upon Rolling Stock."

Outdoor or Indoor

Car Storage.

In the course of the informal discussion leading up to its definite assignment as a subject, it appeared that there is a well-founded belief that the amount of injury to rolling stock from exposure is more than enough to counterbalance a considerable investment in car barns; but there appear to be no definite data available. It is significant, however, that several companies which have heretofore stored equipment out of doors are now either building or preparing to build extensive barns, and the initial expense is undoubtedly warranted if the statement sometimes made that expenses of maintenance are doubled by outdoor storage has any foundation in fact. Another point worth considering in cold climates is the extra expense of bringing a "cold-storage" car up to a habitable temperature. Though figures on this are not available there must be a considerable extra expense from this cause alone which should influence in favor of ample car barn capacity.

When reading the description of the storekeeping methods of the Denver City Tramway Company, as presented in this issue, the question is brought to mind as to whether this system of accounting for stores is not too expensive. The advantages of such a complete system of keeping account of materials will not be denied, neither will the fact that one of the most essential requirements of any accounting system is to keep the condition of credits and debits well in hand. The system, as used in Denver, presents a very thorough method for obtaining such results. As regards the expense of maintaining a storekeeping department it is interesting to note that the cost of office work and handling and care of materials for the work described, has averaged but \$450 a month during the past ten months. This does not include the expense of the purchasing agent's department nor take into account the delivery of track materials on the work, but it does include the expense of weekly deliveries of stores to outlying barns and shops. For the same ten months the amount of materials purchased totaled \$450,000. It will thus be seen that the expense for handling the materials, together with the other desirable results as obtained in Denver, was but one per cent of the total amount of business handled by the department. As to the accuracy and completeness of this method of accounting for materials and stores it is said that during the past eight years the semi-annual inventories have each balanced within \$200 of the correct amounts, as shown on the auditor's books, and three such inventories had such a slight variation that they practically balanced and no adjustment was necessary in the auditor's office.

The Cost of Good

Storekeeping.

BLOCK SIGNALS ON CITY LINES.

The use of automatic block signals on electric railways has thus far been confined chiefly to single-track suburban or interurban lines, but there are cases where such signals are becoming valuable even for urban service. Of course, where the traffic is heavy and schedule speeds low, as in the immediate business districts of large cities, there is little advantage in the installation of block signals for the reason that cars follow one another so closely that the condition of the track ahead as far as it is clear, is easily seen by inspection. At no time is it desirable that the speed of cars in crowded streets should be so great that a stop cannot be made within a few car lengths at the outside. Double tracks are well-nigh universal in such localities and any attempt to divide the track into blocks would almost certainly result in paralysis of traffic.

Outside the business district, however, the conditions of operation are much different and a study of the residential and semi-residential routes often reveals an astonishing number of single-track spurs tapping thickly populated territory. Frequently these lines are run in streets too narrow for double tracks and the number of cars may be too small in the normal hours of the day to justify the double track even if the street be wide enough for it. In the rush hours the headway shortens to a point where careful operation is necessary to avoid collisions and if the topography of the route is unfavorable it may be well worth while to consider the use of automatic signals. A recent case of this kind occurred on a large city system where the headway on a residential spur track is 15 minutes throughout the day, except in the rush hours when it shortens to five minutes. Near the end of the route the track loops around a block joining the spur again about 500 feet from the last turnout on the line. Outward bound cars pass the junction of the loop and the spur before arriving at the end of the route via one side of the loop, and inward bound cars pass back to the line via the other side. Between the turnout and the junction, which is practically the same thing as between two adjacent turnouts on a single-track line, the street is so crooked and hilly that it is impossible to see far ahead of a car; and to increase the safety of the car movements and expedite traffic by reducing delays due to uncertainty as to the occupancy of the track, an automatic signal was installed near each end of the single-track section between the two passing points.

This signaling equipment is operated by the trolley as it passes under a special contact pan in leaving each turnout and it indicates by a red light that the block is occupied by a car moving against the outward or inward traffic, as the case may be, while a green bullseye indicates to the crew of the car following that a preceding car is still in the block, running in the same direction. When the block is clear no indication is given. The block is only about 400 feet long, but a personal inspection of the conditions convinces one that the signals are a necessity for safe operation.

From a detailed case like the above several points occur which can be applied in general to block signaling on urban lines. In a certain sense it is a misfortune for a city system to be obliged to introduce an added complication in operating on any of its divisions. By no means does every single-track spur require automatic block signals for its safe working. As long as the track is straight and the grade moderate, the schedules permitted by law in large cities seldom demand the installation of signals until one passes into the higher speed rural or remote suburban section of the line. Careful adherence to the timetable, the use of the telephone at turnouts when behind time and cautious approach to curves will do much to insure safe operation. The introduction of signaling rules on a city system where only a few signals are in service, opens another door for fallible

human nature to enter into disaster, so that a careful analysis must be made before it is decided essential to install signals of this kind.

It would seem important to include small semaphore indications with the bullseye signals, for the reason that it is difficult to identify the lamp signal in broad daylight, especially if the sun is shining full upon the lenses. After all, the cost of the protection is a small matter; the issue lies between increased safety with increased complication balanced against a very unfavorable track layout and increased danger because of irregular topography. Rules permitting cars to pass through its block two or more at a time, or after due waiting to proceed slowly in the face of a disarranged signal, should be most rigidly drawn and enforced.

A SIGNIFICANT TRANSFER DECISION IN BOSTON.

In connection with the transferring of passengers between elevated trains and surface cars in Boston at the Dudley street and Sullivan square terminal stations, an interesting point was recently brought before the Massachusetts railroad commission. Merchants owning stores in the immediate vicinity of these stations enjoyed a considerable transient business in the earlier days of the operation of the elevated lines, from the fact that passengers on certain lines entering or leaving the terminal, transferred between the elevated trains and the surface cars by means of checks, which permitted them to spend a short time on the street before resuming their journeys. Some months ago the check system was abolished by the railway company in favor of free bodily transfer between the lines of cars entering the terminals at the street level and the elevated trains, so that now if a passenger leaves the terminal enclosure on foot he cannot continue his trip without the payment of an extra fare.

The withdrawal of this transient trade and the failure of the privilege, or rather the difficulty of doing small errands between cars, led to a request on the part of representative merchants and citizens that the old arrangements be restored. After giving the matter a public hearing the commission decided in favor of the company, bringing out the point that while the petitioners appear to hold the theory that the Boston elevated owes them a duty to so transfer passengers that they may attend to business while waiting to take connecting cars, free transfer checks were never designed to give stopover privileges, but are issued solely for the purpose of enabling passengers to make a single journey between two points as nearly continuous as possible for one fare.

The board stated in its decision that the present arrangement for transferring passengers is a better way than that formerly in vogue as far as the legitimate use of the railway is concerned. Such incidental loss of business as may result to persons other than passengers from the abandonment of transfer checks at these points is declared not to be a grievance for which the board can provide a remedy. Passengers who so desire can freely take or leave the cars at these stations; if they wish to continue their journey for a single fare they are afforded a convenient way for doing it.

This decision is certainly a just one, for it recognizes the fundamental purpose of the free transfer and heads off any abuse of the privilege at the points in question. The business propriety of abutting tradesmen is a matter quite beyond the scope of any street railway, as far as it depends upon train privileges. On surface lines it is often possible and perfectly legitimate, incidentally, for a passenger to make a purchase while waiting for a connection, but only within the expiration limit of the transfer. Theoretically, at least, there should be the shortest possible gap between the two cars connecting, and the bridging over of the gap by a

transfer is a matter of identification rather than a stopover privilege. The abuse of transfers will probably continue as long as transfers are used, but every decision which broadly defines their scope is a welcome addition to reviewing precedents.

THE UNDER SIDE OF THE CAR.

An inspection of the under side of a modern high-powered car equipped with multiple-unit control, airbrakes, pneumatic doors and fireproof wiring and floor, leads one to the inevitable query whether we are not going too far away from the ideals of simplicity with respect to maintenance and repairs in our efforts to secure perfectly fireproof rolling stock. It is certainly a far cry from the days of the flexible cable wiring and self-contained platform controller to the present method of running leads in heavily armored pipes, packing contact switches, rheostats and pneumatic accessories into the limited space available beneath the car floor until it is exceedingly difficult to make rapid repairs on such a car, even over a pit.

The fitting together of the parts of a modern car is no small piece of work, and when this is complicated by a large amount of hand and machine tool work before the equipment can be installed, the cost of putting the car on the road becomes a matter of some concern. Certainly a modern fireproof car equipped for heavy rapid transit service comes pretty close to being a more intricate affair than a steam locomotive costing perhaps twice as much. In its erection hundreds of holes must be drilled and many hours of labor paid for in fishing wires through difficult passages and fitting armored conduit and piping into place.

The value of multiple-unit control, even for suburban work is not open to question. The increased platform space and consequent convenience of the cab, joined with the removal of large current-breaking arcs from the close proximity of the passengers and the possibility of train operation when traffic conditions require it, are advantages too great to be waived for a moment. We cannot possibly get along without the airbrake, and the electro-pneumatic brake promises results which are well-nigh perfection in rapid transit control. Pneumatically operated doors and steps are also likely to remain with us for a good while to come. Automatic acceleration is more and more in demand, and it is hard to see wherein any reduction can be made in the actual equipment of the modern car fitted with anything above 150 motor-horsepower. Whatever is done must be in the direction of finding other locations for the crowded machinery.

The moving of practically all the active equipment beneath the car floor is, of course, done for fire protection, and in the last analysis this is why the under side of the car is more crowded with apparatus than a modern battleship. Fireproof construction is vitally important, but it is a question if some of the relays, reversing switches, air valves and the like cannot be placed beneath the seats without extra hazard, if the heating equipment can go there. There is nothing sacred about the roof of a car as long as four or five feet of clear space exists between its top and the trolley wire. It is coming to be frequent practice to instal a main copper fuse on a panel upon the roof, and in some of the later equipments a control circuit switch is also placed on the roof for the purpose of cutting off current if the second trolley pole is not in its proper place.

Due regard must be given appearance in placing any equipment on or near the roof, but lightning arresters and choke coils are now being placed beside the monitors near the hoods without the least objection from the aesthetic standpoint. No one can look into the practical side of modern car design without realizing that the builder is "up against"

a hard proposition in fitting his equipment to the demands of the day and perhaps it will work out in the long run that very little simplification of the car bottom can be effected.

The matter is well worth studying, however, for ease of inspection and accessibility are almost fundamental necessities of economical operation. It would seem that the brushes and commutators of the motors ought to be accessible through a fireproof trap door without hauling the car over a pit, though it is admittedly difficult to design such a door. Cars for elevated and tunnel service need to be designed with much greater regard to their fireproof qualities than those for use in the open air on the streets. The location of wires in armored conduits has doubtless come to stay, and it is certainly a wise step, but it is taken at the cost of flexibility. Just how far rigid construction is desirable must be determined by experience alone.

COMMUNICATIONS.

Joint Electric and Steam Line Tariffs.

To the Editors:

I have just read the interesting item on "Joint Electric and Steam Line Tariff" in your November issue. Although this is doubtless the first joint tariff entered into in the central states, it may interest you to know that a similar arrangement has been entered into here in the northwest. A contract was made more than a year ago between the Coeur d'Alene & Spokane Electric Railway and the Spokane International Railway for interchange of both freight and passenger business, to take effect upon the completion of the latter road. The Spokane International was opened for traffic on November 1, 1906, but through a misunderstanding with eastern connections, the tariff was not made effective until November 20. The Spokane International Railway is a steam road 140 miles in length and gives the Canadian Pacific and the Soo Line an entrance into Spokane. The Coeur d'Alene & Spokane Electric Railway is part of the Inland Empire system, centering at Spokane.

The joint rates of the Coeur d'Alene & Spokane Railway give the merchants an additional line for shipments from eastern territory, and furnish another outlet for lumber to North Dakota and South Dakota, as well as other states east of the Missouri river. Low rates are made on lumber to Soo Line points in North Dakota in place of the sums of local rates to and from junctions of the Great Northern and Northern Pacific that have hitherto obtained. Additional contracts will be made with other transcontinental lines that now clearly see that electric railroads settle up sparsely settled sections of the country, and become the natural feeders rather than the competitors of the steam lines.

CHARLES E. FLAGG,

Spokane & Inland Empire R. R.

Spokane, Wash.

Annual Meeting, Western Society of Engineers.

The annual meeting and banquet of the Western Society of Engineers was held at the Mid-Day Club, Chicago, on January 8. At this meeting the following officers were elected; President, William L. Abbott; vice-presidents, Andrews Allen, E. N. Layfield and A. M. Talbot; treasurer, Albert Reichmann; trustee for three years, Willard A. Smith.

The report of the secretary showed that the organization now has a membership of 925, this being an increase of 96 during the past year.

The speaker of the evening was Mr. Bion J. Arnold, the retiring president of this society, who discussed the progress of electrifying steam roads in 1906. Mr. Arnold has been in close touch with many of the larger electrification projects. His address will be found on page 49 of this issue.

NEW CAR BARNs OF THE BROOKLYN RAPID TRANSIT COMPANY.

The Brooklyn Rapid Transit Company is completing new car barns at Ninth avenue and Twentieth street, Brooklyn, which will cost nearly \$800,000. As in the case of all the improvements which this company has under way, the ques-

entrance from Tenth avenue. The space between the two buildings is 50 feet wide, and the tracks from the Tenth avenue building are continued through two track openings into the basement of the Ninth avenue barns. These track openings are protected by steel doors, which remain closed, except when the tracks are in use.

The existence of the slope from Nineteenth to Twen-

Brooklyn Rapid Transit Company—Ninth Avenue Barns under Construction.

tion of fire risk has been given prominent attention, and for the purpose of greater safety, it was decided to build two separate structures instead of one.

The site selected for these barns sloped from the corner of Ninth avenue and Nineteenth street so that there was

tieth streets made it advisable to build the lower floor of the barns in terraces, each terrace giving space for four tracks. The last terrace, on the Twentieth street side of the Ninth avenue building, will be utilized for shops and inspection purposes, each of the four tracks to be equipped

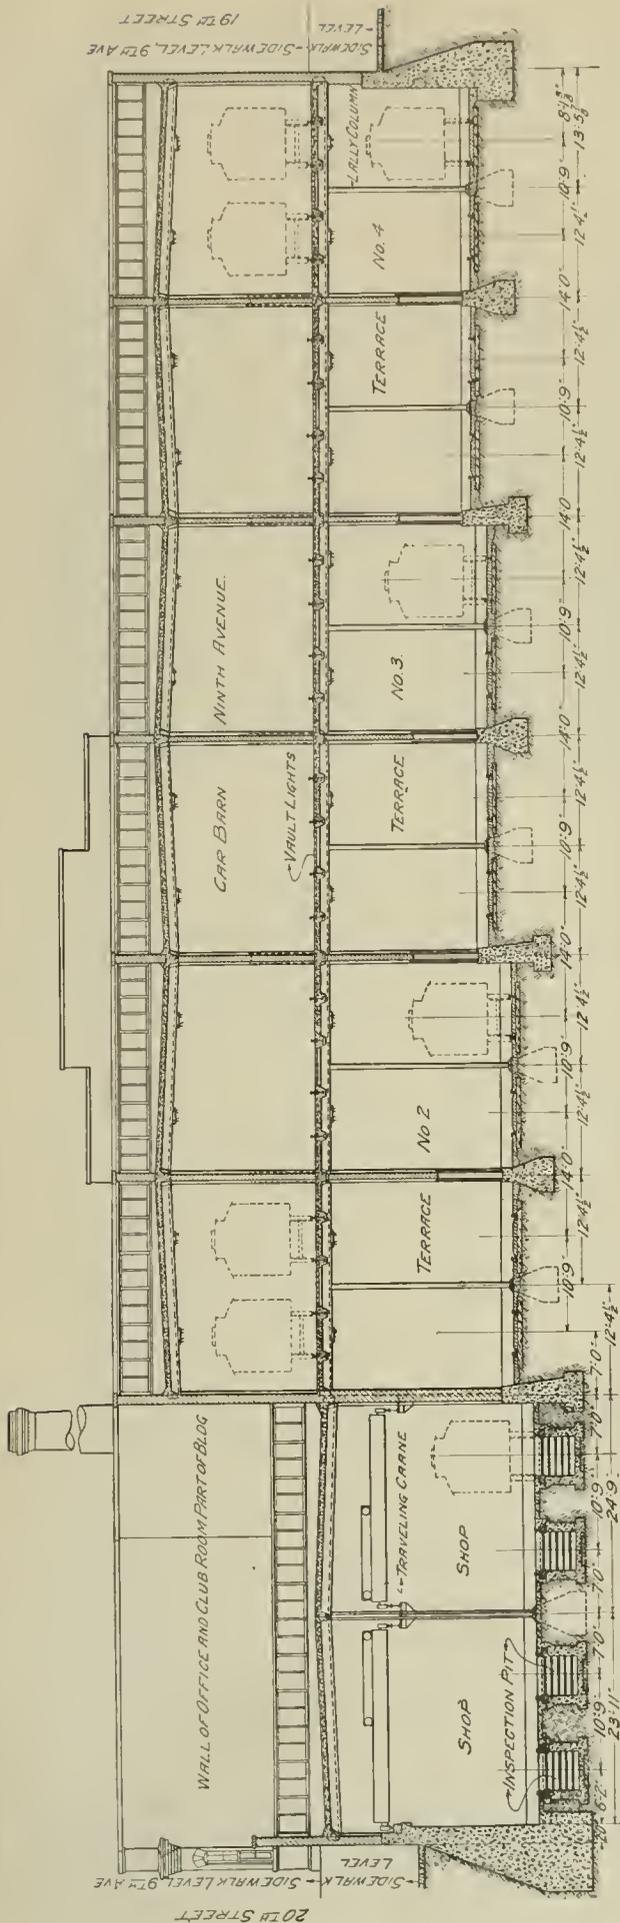

Brooklyn Rapid Transit Company—Floor Plan of Barns and Offices, Ninth and Tenth Avenues.

a considerable grade both from Ninth avenue to Tenth avenue, and from Nineteenth street to Twentieth street. It was therefore decided to excavate to make the Ninth avenue building a double-decked structure, with entrance to the second floor from the ground line at Ninth avenue. The Tenth avenue barn was made a single-story structure with

an inspection pit. Inspection pits will also be built under the corresponding tracks in the Tenth avenue building. The inspection pit tracks in both buildings will be served by a transfer table located in the area between the barns.

The buildings have an aggregate length of about 700

Brooklyn Rapid Transit Company—Cross-Section of Shops and Barns Showing Arrangement of Terraces.

feet, the Ninth avenue building being 359 feet long, and occupying a space between Nineteenth and Twentieth streets of about 200 feet. The lower deck of the Ninth avenue building has 16 parallel tracks, as has also the Tenth avenue building, and the upper deck of the Ninth avenue building has 12 tracks, giving space in the two buildings for 288 of the company's largest surface cars, as follows: Double-deck building; at the Ninth avenue level 94 cars, at the Tenth avenue level 94 cars, in the shop at the Tenth avenue level 20 cars; Tenth avenue building, at the Tenth avenue level, 60 cars; over the inspection pits, Tenth avenue level, 20 cars. This capacity is estimated for cars 42 feet 6 inches long.

As means of fire protection solid fire walls faced by tile and extending through the roof are being built lengthwise through both buildings between each pair of parallel tracks. As will be noted from the accompanying engravings, concrete has been employed for foundation walls, piers, inspection pits, floors and roof. In the Ninth avenue building the tracks on the second floor are laid on longitudinal girders in the reinforced concrete floor beam and supported by transverse steel girders. Vault lights are provided in the floor between each pair of tracks. The fire walls rest on concrete foundations or terrace walls, as the case may be, and consist of an 8-inch hollow tile wall and 12x12-inch hollow tile piers. They are fitted with standard National fire doors. The roof of the Ninth avenue barn and also of the machine shop, which is one story, is a reinforced concrete slab, with tar and slag finish. Skylights over each of the inclosed sections are provided, spaced 20 feet apart longitudinally. These skylights are protected by reinforced concrete combing 8 inches high at the high point of the roof. The 12-inch brick parapet walls are capped by blue-stone coping.

In finishing the interior all ceilings and walls will be painted with two coats of cold-water paint, and the walls will be finished with a dark wainscoting 4 feet high.

Each pair of tracks in the machine shop is provided with an overhead electric traveling crane running the entire length of the room, for the handling of car bodies and trucks.

The machine shop is equipped with a full complement of machinery and tools, and all drills, lathes and planes are independently driven by individual motors. At the west end of the shop a mezzanine gallery has been hung, in which are the office and locker rooms of the shop force and the branch offices of the mechanical department of the Brooklyn Rapid Transit Company. Occupying a part of the mezzanine and more of the ground floor of the southwest corner of the building are the quarters of the operating department of the division. The two departments are, however, entirely isolated in the structure, the shop men and the car crews only coming together in the club rooms, which are on the ground floor, along the Twentieth street side, immediately in the rear of the depot master's offices. The club is similar to the institution maintained by the company at East New York, and contains a large room devoted to pool and billiards, a bowling alley and lunch room. Heat is supplied by a steam plant in the building.

At the Columbus shops of the Indiana Columbus & Eastern Traction Company journal bearings are dressed by the use of a boring-bar rather than a lathe tool. The bar fits into the shop lathe centers and is provided with three adjustable cutting points. When a bearing is to be machined it is held in a pedestal resting on the bed of the lathe. The pedestal clamps the two parts of the bearing so that they are held together firmly and at the desired height. The boring-bar is then passed through the opening in the bearing and the chisels adjusted to take the proper cut. There are three chisels on the bar, the center one of which is used to dress the inside, and the other two for the ends of the bearing. By the use of this boring-bar it is possible to prepare bearings with much more accurate and uniform results than by the use of a lathe tool.

BRITISH ELECTRIC RAILWAY AFFAIRS.

(FROM OUR LONDON CORRESPONDENT.)

An ambitious scheme for controlling the electric supply of London is as vast in area as was covered by the recently withdrawn administrative county of London scheme. In the proposed bill to be introduced in the session of 1907 the power is sought to amalgamate 13 private companies operating in and about London. The amalgamation would be accomplished by means of a joint committee representing the companies. The committee would be endowed with all the powers of a business corporation. The area over which the "committee" seeks to operate in the supply of energy in bulk to companies or local authorities covers the county of London and numerous boroughs in Essex, Surrey, Kent and Middlesex. The committee also asks to be enabled to enter into agreement with the North Metropolitan Electric Supply Company, the Kent Electric Power Company, or any other body, for "mutual assistance or for combination." Provision is made for ultimate purchase by the London County Council or other authorized authority.

* * *

As one of the pioneer electric lines, the Central London Railway has had to pay rather heavily for some of its experience. The generating equipment, for instance, as installed at the Shepherd's Bush power station, is very much out of date in these days of universal adoption of the steam turbine for large electric power installations, although in this respect the London County Council is in a worse case, as there existed no justification for the use of reciprocating units at its Greenwich power house. The Central London's most costly experiment has, however, been in connection with its locomotives. When the line was first opened heavy electric locomotives were used to haul the trains, and these had to be abandoned within a short time, chiefly owing to the vibration in the neighborhood of the line, which threatened to lead to extensive litigation on the part of property owners and residents. In addition to the loss caused by so much valuable equipment being thus rendered useless, the company was obliged to go to the expense of equipping its cars with electric motors and control apparatus. A market has now been found for the discarded locomotives, two of which have been sold to the Metropolitan railway, which has been experimenting with them on the St. John's Wood line. The arrangement should be mutually satisfactory, since the Metropolitan will require a large number of electric locomotives on the final withdrawal of steam traction and will, presumably, obtain them at a lower price than would have to be paid for new stock.

Another economy affecting both the Great Western and Metropolitan companies will immediately result from the introduction of electric traction between Aldgate and Hammersmith, which has partially commenced. This service is maintained over a line partly belonging to the Metropolitan, partly to the Great Western and partly to the Hammersmith & City. The latter, a non-operating concern owning no rolling stock, has hitherto been worked by the two companies, each providing its own locomotives and trains. Dual services of this nature are naturally expensive to work, and it was very wisely decided not to build separate electric cars, but to run joint rolling stock instead, thereby diminishing both capital outlay and running expenses. A further saving in this service will be effected on the complete withdrawal of steam trains, which by enabling the time of the journey to be shortened will result in a smaller number of trains being required. In passing it may be mentioned that this is probably the first instance on record of joint rolling stock being employed on an electric railway. The obvious economy of the arrangement should lead to its further adoption where possible.

The demoralized condition of the electrical manufacturing industry in this country has its dangers for the consumer,

who may prematurely indulge in self-gratulation when observing the effect of competition upon price. That year after year with monotonous regularity there should be business carried out running into millions sterling without a penny of net profit must tend to increase the manufacturers' temptations to reduce costs at the expense of efficiency, and it is unquestionable that there are many generators and motors regularly sold which are falsely rated; that is to say, they do not contain sufficient materials to perform their nominal and specified duties. There appear to be two main types of customers for electrical apparatus: those who habitually order a 10-horsepower machine for work calculated to represent 7 or 8 horsepower, and those who order a similar machine and expect it to sustain a heavy overload. The former class unfairly favors the less scrupulous manufacturer, while the other class works equally obvious mischief. If practicable, it would be of great value to the whole industry to have some system of inspection equivalent to the practice in regard to weights and measures, with penalties for shortage in horsepower. For the commercial depression in this branch of manufacture, which is another question, there are only two possible remedies. Either we must witness the complete or partial closing of some of the larger works, or there must be formed an association for the avoidance of desperate competition.

* * *

The London Brighton & South Coast Railway Company announced some time ago that it intended to experiment with single-phase electric traction on the Peckham Rye to Battersea Park section of its system. The work is now nearly completed and will shortly be ready for trial. So far the announcement has made little or no impression on the public. Nevertheless, it is probable, in a high degree, that this experiment will open an epoch which will have a radical influence on the railway investments in which many of the public are interested. The disproportion between the real importance of this experiment and the interest taken in it by the railway investor is readily explained by the fact that electrical technicalities are not within the comprehension of the average man. Even a judge may be forgiven for ignorance of the mysteries of the "single-phase system." Yet it is quite possible to explain the commercial advantages of the new system of electric traction without appealing to the mysteries of electricity. So far our electrified railways, from the Northeastern down to the District, have followed the old familiar tramway model. They are "glorified tramways," the main difference being that, instead of the overhead trolley wire, they have had to use a much larger conductor, placed as "third rail," to carry the heavy currents required to move heavy trains. For tramways and suburban railways this system, in which continuous currents are used, has been wonderfully successful, but as a business proposition it is not as suitable for long-distance railway work. What tells against it is the complication and cost of the power transmission arrangements.

* * *

An important new project is contained in the proposal to construct a tunnel under the Thames between Greenwich and Purfleet, for which powers are to be sought in the next session of Parliament. The new tunnel is to be equipped for electric haulage and it is estimated to cost about 700,000 or 800,000 pounds sterling, including works, land and the necessary connecting railways and sidings. The line will be four and a half miles long. As chalk is the substance through which the tunnel would have to be pierced it is not anticipated that the work would be very arduous. The scheme has the support of the principal railway companies.

The Green Bay Traction Company is now building five new stations at its shops in Green Bay, Wis., which will be placed along the Kaukauna-Green Bay Interurban line for the accommodation of passengers. These resemble a regular passenger station, but on a miniature scale, and they will hold six or eight people at a time.

proper credit is given to the material and stores account and the bill is given a number and entered in a sales book, which carries the totals through to the end of the month. The pages of the sales book are 10½ by 16 inches and are ruled to receive the following data: Bill number, to whom sold, description of material, price, amount, total amount and the accounts to which credit should be given.

Each month a statement of all the business done by the storekeeping department for the past month is rendered to the auditor. This statement makes available the stores accounts distributed as to operating expense, construction expense, balance on hand, etc. When the information on this report has been checked by the auditor the storekeeping department balances its ledger. In this ledger all materials received are debited to the material and stores accounts and all disbursements are credited to the same account; thus the balance shows the stock on hand.

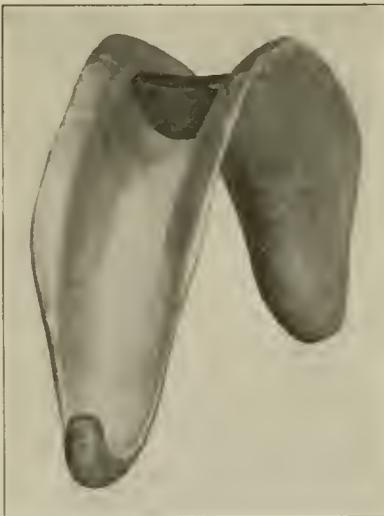

A special book is kept for recording the material used and the costs of articles manufactured in the company's shops. On the pages of this book are itemized the supplies drawn from the storekeeping department by the special requisition for shop jobs; the record for such jobs is kept on these pages until the job is completed, and then a special shop order exhibiting the number of the job is returned and the labor is added to the amount of the material used. It is thus possible to get net costs for the finished goods returned to the storeroom.

In order to have the material accounts exhibited in a simple form a journal or memorandum book is kept and cross entries made charging the accounts benefited by material unused and crediting the accounts from which the original material was drawn.

A SIMPLE SLEET CUTTER.

The accompanying illustration shows a sleet cutter designed by Mr. C. E. Atkinson, master mechanic of the Richmond, Ind., shops of the Indiana Columbus & Eastern Traction Company. This type of sleet cutter has been used for a year and is said to have worked very satisfactorily.

It will be noted that the device consists of a semi-circular brass shell with a removable and reversible copper lug. This lug has its flat sides tapered so they fit into a slot cut transversely in the center of the shell. When in use the shell fits into the groove around the trolley wheel and as so placed the lug is held firmly in its position. At one end of the shell, which is of cast brass, is a small projection designed to fit into a ⅜-inch hole in the trolley harp; the other end is provided with a hook around which the trolley rope may be looped, thus holding the shell and in turn the lug firmly in the groove of the trolley wheel and assuring that the hard copper lug will bear against the trolley wire. Other than its low cost, this form of sleet cutter has the advantage that it may quickly be attached to a trolley pole, and also that a supply of copper lugs may be carried by the car crew and on long runs inserted when necessary. Consisting as it does of only two parts, the first cost of the device is quite low.

Sleet Cutter with Removable Wearing Surface.

TIE PLATES, BRACED TIE PLATES AND TIE RODS.*

BY E. P. ROUNDEY, ENGINEER MAINTENANCE OF WAY, SYRACUSE RAPID TRANSIT RAILWAY COMPANY.

Our attention was first called to the inefficiency of braced tie plates as a means of holding girder rails to gauge, when the cars on several of the lines in Syracuse began to leave the tracks; and in every case we found the track in the neighborhood of the place of derailment to be from one-half to one inch wide gauge.

The track construction on these lines is as follows: Nine-inch half-groove rail, Lorain section 90-317, oak ties, 6 by 8 inches by 8 feet, six inches of coarse gravel ballast, and malleable iron brace plates every six feet. The concrete for the paving, which is both brick and asphalt, extends from the bottom of the tie to about four inches above it. The track has been down about ten years.

The derailments became so numerous a short time after putting some new heavy cars on the lines, that we decided to place tie rods in all of our tracks having the half-inch groove rail and brace plates.

When the track was opened for the tie rods we found the ties in fair condition, but many of the brace plates were bent backwards and others twisted away from the head of the rail, being practically of no use for holding the rails to gauge. The track had been gradually widening out under the small cars and when the large heavy cars were run, it took only a short time to widen the gauge until the track was unsafe.

Tie rods have now been placed in most of this track and we have had no more trouble with derailments. The great objection to brace plates, judging from our experience, is due to their being spiked to wooden ties. They are dependent for their efficiency on the holding power of the spike, and as the ties get old the continual tipping of the side-bearing rail loosens the spikes, and allows the brace plates to twist and become loose; they also cut into the ties as the ties decay, thus allowing the rail to tip outward. A great deal of care should be taken when putting on brace plates, as the spikers will often twist them when spiking and get a poor bearing under the head of the rail; crooked or uneven ties will also make trouble in getting a good job.

We have some steel brace plates on a piece of track which has been down for about three years and have had no trouble as yet, but the cars are small and 10 minutes apart.

When this track is to be paved we shall place the tie rods six feet apart in addition to the present brace plates. The use of brace plates would be advisable in laying track in an unpaved street, which would be paved in a few years, as a strong steel brace should hold the track when the ties are in good condition, and when the street is paved we shall put in the tie rods.

The objection to tie rods in an unpaved street is that, as the filling between the rails settles, the rods are exposed to wagon traffic and bent or broken. The theoretical objections to brace plates as compared with the tie rods are as follows: The brace plate depends for its efficiency on the condition of the tie, and braces each rail independently; if the braces on one side fail the gauge will widen; with the tie rod, if the rails get out of line, they will move together and maintain the gauge. On ordinary girder-rail track a half-inch or so wide gauge will not cause derailment of cars, but with the half-groove type, especially Lorain section 90-317, half-inch wide gauge trouble will occur much more frequently.

The lip on this rail is thin and narrow, and flattens down under wagon traffic, often breaking off in places. When a car comes to a place where the track is a half-inch or more wide gauge, the flanges of the wheels on one side get inside of the lip of the rail and when the track comes to gauge again the opposite wheels are forced over the head of the rail, causing derailment of the car.

With this type of rail to contend with, necessitating tight gauge for safety, tie rods are the best fastening. If a strong steel brace were used in connection with a steel tie, it should make an efficient device for holding the rails to gauge.

There is not much to be said in favor of the use of ordinary tie plates on rails in a paved street, as the concrete between the ties will support the rail, and keep it from cutting into the ties to any appreciable amount. However, the concrete in the older tracks in Syracuse does not seem to be of any use for holding the rails to gauge as spreading has occurred as stated.

*Presented before the Street Railway Association of the State of New York January 11, 1907, Buffalo, N. Y.

ENGINEERING ASSOCIATION EXECUTIVE COMMITTEE
MEETING.

A meeting of the executive committee of the American Street and Interurban Railway Engineering Association was held at the rooms of the Transportation Club, New York, on January 7. There were present, President H. H. Adams, superintendent of shops, the United Railway & Electric Company, Baltimore, Md.; Vice-President Fred G. Simmons, superintendent construction and maintenance of way, Milwaukee Electric Railway & Light Company, Milwaukee, Wis.; Secretary and Treasurer S. Walter Mower, general manager Southwestern Traction Company, London, Can.; F. H. Lincoln, assistant general manager, Philadelphia Rapid Transit Company, Philadelphia, Pa.; Fred N. Bushnell, chief engineer, Rhode Island Company, Providence, R. I.; W. T. Dougan, engineer maintenance of way, New York City Railway, New York; B. V. Swenson, secretary, American Street and Interurban Railway Association; H. W. Blake, Street Railway Journal; C. B. Fairchild, Jr., Electric Traction Weekly; and F. W. Lane, Electric Railway Review.

The report of the secretary and treasurer showed a balance of \$266 on hand. In relation to finances Secretary Swenson expressed the belief that the financial condition of the principal association would be such as to enable all work desired to be done by the affiliated associations to be carried out satisfactorily. In reference to committee work Mr. Simmons expressed the view that the work would be done better and more willingly if it were understood that the committee's expenses would be taken care of by the association.

In the consideration of subjects for papers for the next convention there was some discussion of the desirability of joint action between the Engineering and the Claim Agents' associations as to vital points in rolling stock design and construction that might have a bearing upon work of the claim agents. This was in line with the address of S. L. Rhoades of the Claim Agents' association at the Columbus convention. Several points were suggested to which the consideration of the two associations might advantageously be given jointly, such as with reference to car steps, folding running boards, gates, etc. President Adams suggested that the claim agents be asked to prepare a statement of points in which they would be particularly interested. Mr. Lincoln stated it was the practice of the claim department upon the road with which he is connected to send to him each month a list of such claims as had come up during the month and which were based upon mechanical defects. This statement gave the amount claimed and the particular cause and it was stated that these data were sufficient to enable each case to be followed up individually until the blame was located exactly where it belonged. The practice had resulted in a reduction of claims of nearly 75 per cent by removing the cause upon which the claim was based. The matter was summed up in the following resolution which was presented by Mr. Simmons and which was adopted:

Whereas, There are many mechanical details in connection with the construction and operation of electric railways which are of great importance to the claim agents of the various companies and regarding which they may desire to suggest alterations and improvements in present practice:

Therefore, Be It Resolved, that the executive committee of the Engineering Association hereby expresses to the Claim Agents' Association its desire that this matter be given consideration at its discretion and such suggestions made and such action taken as may seem desirable.

And Be It Further Resolved, that in the opinion of the executive committee of the Engineering Association this matter should come up for comprehensive consideration at a joint meeting of the associations during the 1907 convention.

The subject of "Shop Accounts," which was left in an unfinished state at the St. Louis convention was not definitely acted upon.

"Gas Engines," upon which a valuable paper was presented at the last convention by Mr. Paul Winsor, was retained upon the programme for the present year, with a view to having

the operation of the plant described by Mr. Winsor brought up to date. It was also decided to invite Mr. W. W. Cole, general manager of the Elmira Light & Water Power Company, Elmira, N. Y., to furnish a paper covering his experience with gas engines.

Upon the subject of "Steam Turbines" Mr. Lincoln was instructed to hold himself responsible for the preparation of a paper, and it was also suggested that it might be possible to secure a paper treating this subject from a historical point of view from Professor Storm Bull of the University of Wisconsin.

The method followed in the consideration of these subjects was that of holding a member of the executive committee responsible for the preparation of certain papers, whether prepared by himself or someone else at his request.

The committee on "Standardization" was continued from last year. Some changes were made in the composition of the committee, H. W. Blake and C. B. Fairchild, Jr., being appointed in place of Paul Winsor and F. H. Lincoln. As chairman of the committee on "Maintenance of Way" Mr. Simmons suggested the desirability of a paper on "Care of Roadbed and Right of Way on Interurban and Urban Lines," this to cover such subjects as oiling and sprinkling the roadbed, keeping poles and grounds in presentable condition, etc. It was also suggested that this topic be assigned to a sub-committee, which should endeavor to get in touch with all maintenance of way officials and obtain data in a form to be turned over to the "Standardization" committee. The "Maintenance of Way" committee is now composed of F. G. Simmons, chairman, Thomas K. Bell, Interstate Railways Company, Philadelphia, and C. A. Alderman, Cincinnati Traction Company.

"The Wear of Rails and Joints in New York City" was assigned to W. T. Dougan, engineer maintenance of way, New York City Railway, New York. In discussing this subject the matter of corrugation of rails was brought up and Secretary Swenson was requested to secure data from members of the association and others for publication in the proceedings.

"Concrete Ties" was also suggested as a subject and an endeavor will be made by the committee on "Maintenance of Way" to secure data.

"Control Apparatus," a subject carried over from last year, was assigned to a committee as follows: Chairman, J. S. Doyle, Interborough Rapid Transit Company, New York, George J. Smith, Kansas City Railway & Light Company, P. J. Callaghan, Pittsburg Railways Company.

"Maintenance and Inspection of Electrical Equipment" was assigned to a committee consisting of John Lindall, Boston Elevated, W. D. Wright, Rhode Island Company, Providence, R. I., E. T. Munger, Metropolitan West Side Elevated, Chicago, L. L. Smith, Schenectady Railway Company, Schenectady, N. Y.

President Adams expressed the view that the last-named subject should be handled with special reference to inspection on the mileage basis.

R. B. Stearns, Chicago & Milwaukee Electric Railroad, was appointed representative to the American association on the committee on "Insurance."

"Car Cleaning, From a Sanitary Point of View," was suggested but after consideration it was thought to be a transportation rather than an engineering subject and it was decided to suggest it to the committee on subjects of the American association.

"Open versus Closed Terminals, with Reference to Effect on Rolling Stock," was assigned to a committee consisting of E. W. Olds, Milwaukee Electric Railway & Light Company, Martin Schreiber, Public Service Corporation of New Jersey, and John Hanf, International Railway Company, Buffalo.

"Car Houses for Both Operating and Storage Purposes" was assigned to a committee consisting of F. N. Bushnell, Rhode Island Company, Providence, R. I., R. C. Taylor, Indiana Union Traction Company, Anderson, Ind., and Nelson

Graburn, Montreal Street Railway Company. It was decided with reference to this subject that the committee should not attempt to make recommendations but endeavor to secure as large a number as possible of typical plans of car houses and assemble them for convenient reference.

It was voted as the sense of the executive committee that at the annual convention the session should not be opened on Monday morning but that the first session should be at two o'clock p. m. on Monday.

QUARTERLY MEETING OF THE NEW YORK STATE ASSOCIATION.

The Street Railway Association of the State of New York held a quarterly meeting at the Iroquois Hotel, Buffalo, on January 11, 1907, convening at 10 a. m. There were about 50 members and guests present. Especially valuable papers were read treating the subject of "Track and Roadway."

In the discussion Mr. I. E. Matthews, chief engineer of track Rochester Railway Company, favored the use of nine-inch grooved rails laid on oak ties supported by concrete. He thought this type of structure was most satisfactory for the streets with heavy traffic, and that where traffic was light it might be well to use T-rail with a flange-way in the pavement adjacent to the rails. Mr. F. D. Jackson, roadmaster International Railway Company, favored the use of Carnegie steel ties embedded in concrete and supporting nine-inch girder rails.

Mr. E. P. Roundey, engineer of maintenance of way Syracuse Rapid Transit Railway Company, presented a paper on "Tie Plates, Braced Tie Plates and Tie Rods." This paper will be found on page 44 of this issue.

In discussing track substructures Mr. A. H. Stanley, Public Service Corporation of New Jersey, stated that in some instances concrete had failed and for this reason broken stone was favored. Other speakers favored the use of concrete with gravel instead of broken stone.

Mr. C. G. Reel, Kingston Consolidated Railroad Company, read a paper in which he presented strong arguments favoring T-rails. In the discussion of this paper many good reasons were advanced showing why T-rail is preferable to girder rail. Mr. T. W. Wilson, International Railway Company, Buffalo, did not favor the use of T-rail in streets where the traffic was especially heavy.

Papers were presented on various methods of making rail joints. Mr. P. N. Wilson, Rochester, presented a paper on "Electric Welding." In the discussion several opinions were favorable to the "thermit" process.

The members of the associations and guests were entertained at lunch by Messrs. H. J. Pierce and T. W. Wilson, of the International Railway Company.

NEW LINES NEAR LOUISVILLE.

The Louisville & Eastern Railroad Company, of Louisville, Ky., has recently completed the nine-mile extension of its lines from Beards to La Grange, Ky., and is now operating its cars through from Louisville, a distance of 27 miles, on one-hour headway.

A substation at Buckners and an addition 50 by 55 feet in floor area, to the power plant at Marcia have recently been built. The new installation at the power plant includes: Two 250-kw. direct current Westinghouse generators and one 300-kw. alternating-current generator, 200-kw. rotary converter, 450-hp. Buckeye engine and a 250-hp. Vogt Machine Company boiler. A 6,600-volt transmission line has been built between the power house and substation.

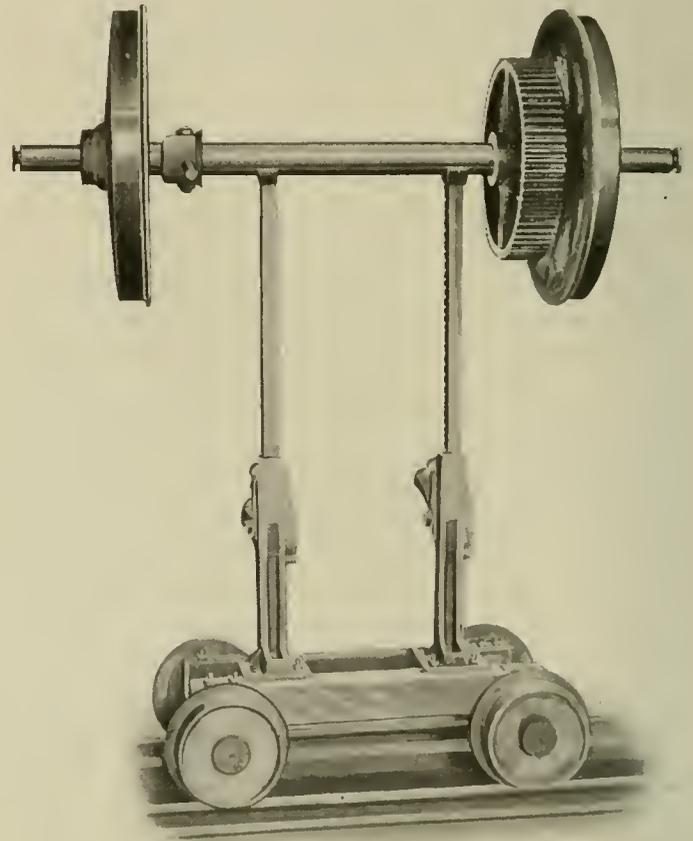

In view of proposed extensions of the railway the power house improvements are of a temporary nature. Before the Shelbyville division is completed, the contract for the grading of which has already been let, a new power plant will be

erected at a point more centrally located and where a better water supply may be had.

The Shelbyville division is a branch leaving the present line near Louisville and following the Shelbyville pike for a distance of 27 miles, passing through Middletown and Simpsonville. The route selected for the line is thickly settled. It is planned to use either the single-phase alternating current or the 1,200-volt direct-current system for operating this line.

A SIMPLE PIT JACK.

The pit jack shown in the accompanying illustration is probably about as simple a device as could be built for raising and lowering wheels under cars. This device, as used in the repair shop of the Hot Springs (Ark.) Street Railroad Company, consists of two track jacks bolted to parallel timbers resting on the axles of two pairs of small flanged wheels. The entire truck may easily be moved along a narrow-gauge track laid in a cross pit. Thus the jack

A Simple Pit Jack.

serves all the repair pits of the shop. The Barrett jacks as used have 47-inch rams so that there is considerable vertical movement possible.

When wheels are to be lowered the car is placed in position over a removable section of the repair-pit track. The axle is then made clear of the journal and motor bearings and the jacks raised until the wheel flanges are clear of the track rails. The removable sections of the pit-track rails are then shifted so that the jacks carrying the car wheels may be lowered until the wheels will clear the pit tracks. It is then a simple process to roll the truck carrying the wheels, along its own track until such a position is reached where the wheels may be lifted by an overhead crane or set upon planks across the pit and rolled onto the shop floor.

REGENERATIVE CONTROL.*

BY A. RAWORTH.

In using shunt motors for electric traction certain difficulties are encountered. Thus there is the difficulty of changing from series to parallel, or vice versa, which consists principally in the fact that the speed of the armature varies inversely as the strength of the field and directly as the voltage across the brushes. It is obvious, therefore, that in changing from series to parallel the field strength must be practically doubled, otherwise the moment the armature circuit is closed across 500 volts a violent attempt will be made by the motors to accelerate the car.

The operation of strengthening the field can be carried out fairly quickly, but not quite quickly enough, consequently it is necessary to insert some resistance in series with the armatures to check momentarily the rush of current due to the inexactitude of the field strength. This will be referred to later.

It is also necessary to insert some series field winding in series with each armature, for without this precaution the motors would not work in parallel.

It is also an essential condition that in breaking the current either when going out of series or when coming out

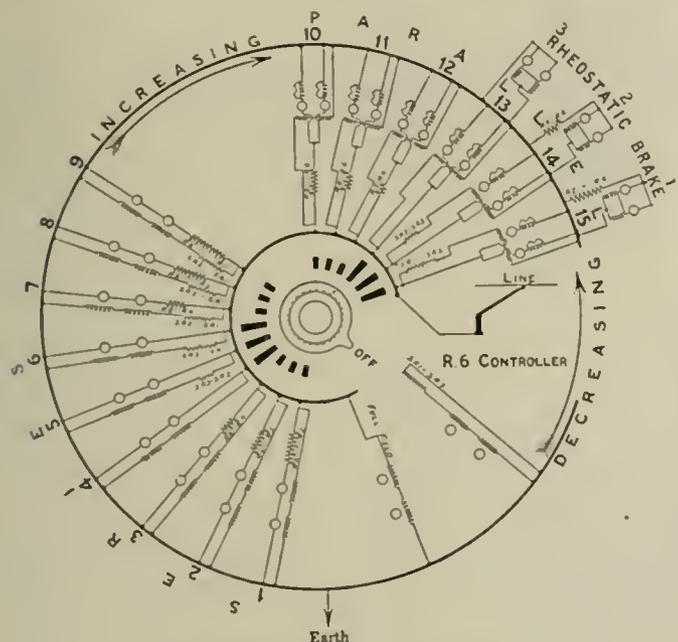

hour faster than the minimum reactive speed. On notches 7, 8 and 9, when the controller handle is being turned in a clockwise direction, the connections are exactly the same as on notch 6. Thus, when the circuit is opened preparatory to going into parallel, there is no resistance in the armature circuit. On notch 10 all the resistance in series with the shunt fields is cut out, thus giving the maximum field strength, the armatures are connected in parallel, each in series with its series field winding and resistance is inserted in the main circuit. A resistance is put in parallel with the series windings in order to shunt a portion of the current, therefore only so much current as will balance the load between the two armatures is allowed to pass through the series winding. On notches 11 and 12 the resistance in the main circuit is cut out in steps, and on notch 13 the armatures are in parallel across the full voltage, the field strength being at the maximum. On notches 14 and 15 resistance is inserted in steps in the shunt field circuit to attain the top speeds.

When the controller handle is turned in a counter-clockwise direction, the same combinations as when accelerating are made as far as notch 13, and the speed reduced from the maximum down to a speed which is only slightly more than double the maximum regenerating speed in series. But on notches 12, 11 and 10 the connections are exactly the same as on notch 13, and when the circuit is opened preparatory to going into series there is thus no resistance in series with the armatures. On notch 9 resistance is connected in series with the shunt field windings and the armatures are connected in series, in series with resistance. On notches 8 and 7 this resistance is cut out in steps until on notch 6 the armatures in series are connected across the full voltage. On notch 5 the resistance in series with the shunt fields is reduced, and on notch 4 it is cut out altogether. At this point the speed of the car has been reduced to the minimum regenerating speed. The handle is then shut off in the usual manner and the hand brake applied. But when moving the handle from notch 4 to the off position, the resistance which was inserted on notches 1, 2 and 3, when moving in a clockwise direction, is kept short-circuited, thus again providing for the opening of the circuit with the armatures connected across the full voltage. The rheostatic brake notches 1, 2 and 3 make connections similar to those used for the same purpose in ordinary controllers. But these notches in the controller coincide with the power notches 15, 14 and 13. This is effected as follows:

Notches 1, 2, 3, 10, 11 and 12 make connections as shown on the diagram when the controller handle is moving in a clockwise direction, but when the handle is turning in the opposite direction the resistance in series with the armatures is kept short-circuited.

The notches 7, 8 and 9 give connections as shown in the diagram when the handle is moving in a counter-clockwise direction, but the resistance in series with the armatures is kept short-circuited when the handle is moving in a clockwise direction.

Referring to Fig. 2, which is a development of the controller laid out in the usual way; finger 22 is connected direct to the trolley, and the six fingers immediately below it are connected to the resistance used in the armature circuit. When the controller cylinder connects the trolley finger 22 to one of these resistance fingers, the current flows through the resistance connected between that finger and the bottom one R. 6 and then through the armatures. For instance, on notch 1 finger 22 is connected to finger R. 2, the resistance in circuit is therefore R. 2 to R. 6. On notch 5 the finger 22 is connected to finger R. 6, the resistance is therefore short-circuited. Now contact ring X, is loose on the main cylinder, and is driven by a pin working in a slot, which enables the loose ring to lag between the main barrel by the space covered by three notches. When the controller is turned in a clockwise direction, the position of this slip-ring is as shown on the diagram, but if the controller is moved, say, to notch 6, and then back to the off position, the slip contact hangs back three notches behind the rest of the main cylinder and takes up the position shown in dotted lines. It will thus be seen that the resistance in circuit on notches 1, 2, 3, 10, 11 and 12 is short-circuited when the controller handle is being turned in a counter-clockwise direction. In the same manner the resistance in circuit on notches 7, 8 and 9 is short-circuited only when the handle is turned in a clockwise direction. Now notches 13, 14 and 15 are rheostatic brake notches when the barrel is turned past the off position. The finger 22 is disconnected from the trolley and connected to earth, and the series fields are reversed by the small brake cylinder on the left of the diagram. The resistance in circuit on the first notch is R. 2, R. 6, on the second notch, R. 4, R. 6; and on the third

Regenerative Control—Figure 1.

of parallel, there should be no resistance in circuit, otherwise there will be heavy flashes in the controller. In this respect shunt motors differ entirely from series motors, in combination with which latter resistances are necessary when opening the circuit.

The method by which the resistances are put in circuit before closing the armature circuit and taken out again before breaking the circuit will be described later on. Apart from this little difficulty, the operation of this controller is simplicity itself. The series of operations is shown in Fig. 1, which is a diagram showing the connections on each notch of a series parallel controller arranged for working two motors. Referring to this diagram, it will be seen that the shunt field circuit is first closed, then on the first notch the armatures are connected in series with resistance. The resistance is then cut out in steps and on notch No. 4 the armatures are in series across the full voltage, the shunt fields being fully excited. This notch gives a speed of from 3½ to 6 miles an hour, according to the type of motor used. But it is an advantage to have the minimum reactive speed as low as possible, both for the sake of economy in current due to the reduction of the rheostatic period and because it is the minimum speed at which the motors will return current to the line. On notches 5 and 6 resistance is inserted in the shunt field circuit with the object of increasing the speed, the speed on the sixth notch being 3 or 4 miles an

*Read before the Leeds (England) Local Section of the Institution of Electrical Engineers, November 22, 1906. Abstracted by The Electrician, London.

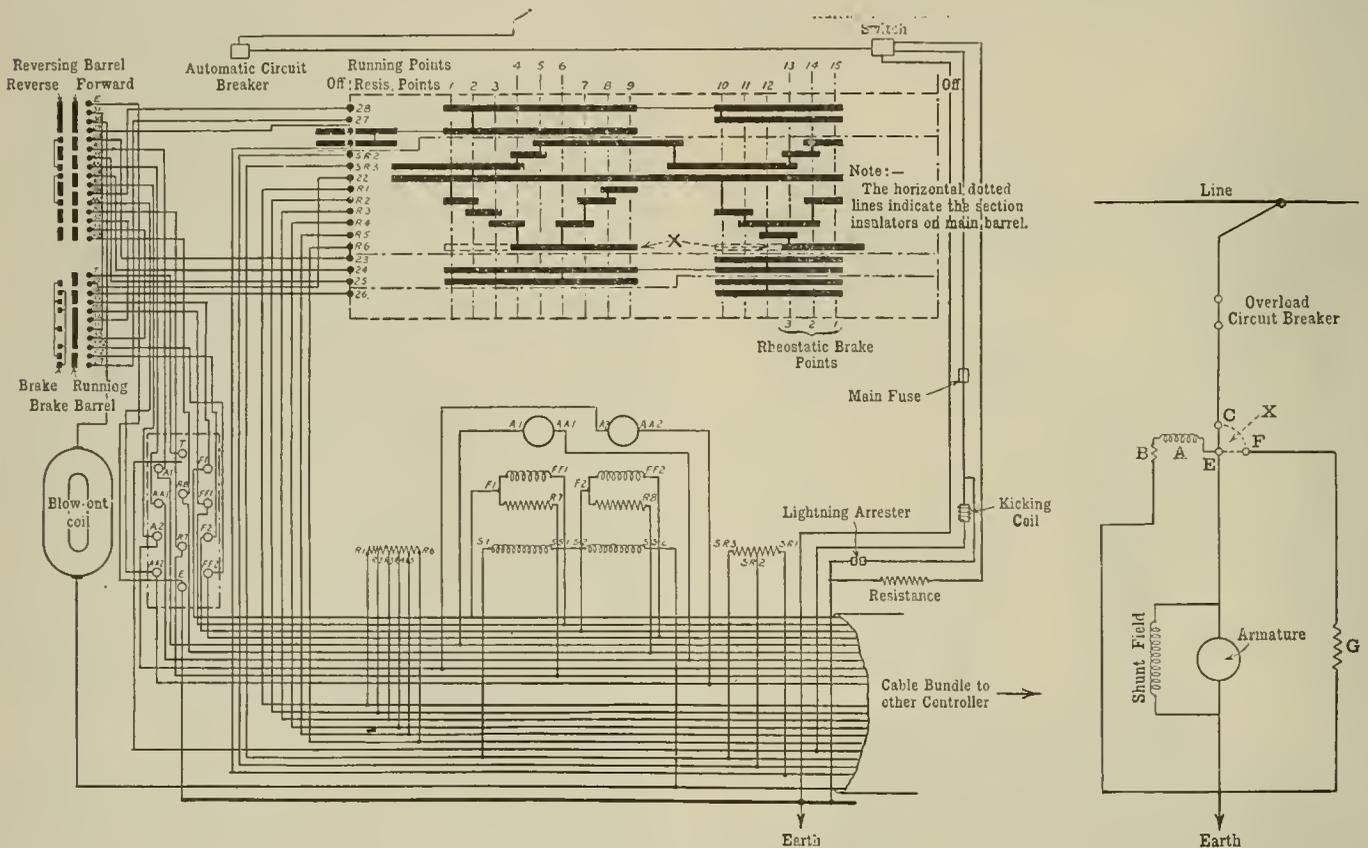

notch all resistance is short-circuited by contact X., which will be in the position indicated by dotted lines.

The present form of controller has only been in existence 12 months, but about 100 of them are working successfully. When the first experiments were made in 1903 the motors were connected permanently in series, the speed being regulated by the shunt field. This worked well on the level, but great difficulty was experienced in preventing drivers from climbing steep gradients with a weak field, which caused heavy flashing at the commutators. It was then recognized that the introduction of the series parallel system of control was necessary to make the regenerative system suitable to all conditions. The first scheme was to weaken the field until the armatures had attained a speed in series double the minimum reactive speed, then to open the armature circuit, double the shunt field strength, close the armature circuit again with the armatures in parallel, and then again weaken the shunt field to attain the necessary speed. For these experiments a box full of open switches was used. It was found that the armatures could be put into parallel only by making a considerable pause to allow the field to

braking. If a car were descending a grade, and from any cause were cut off from the source of supply, the braking effect would be immediately lost, also the driver in shutting off his controller might produce momentarily the combination of a strong field and a high speed, thus allowing the motors to generate a voltage which has destroyed a considerable number of lamps and not a few station voltmeters.

Both these troubles have, however, been cured, or rather prevented, by the device shown diagrammatically in Fig. 3. Suppose a car to be descending a gradient at, say, six miles an hour, and suppose also that while so doing the trolley comes off the wire, there is a tendency for the voltage across the motors to increase; directly this happens, the current in the coil A increases and trips the switch X, so establishing a circuit from contact E to F, and then the resistance C to earth.

In actual practice it is found that should the supply be interrupted as explained above, a car can be brought to a speed as low as two miles an hour by the ordinary movement of the controller handle, the regenerated current passing through the resistance C, instead of along the trolley

Regenerative Control—Figures 2 and 3.

increase, and then only on the level. To cure this the controller was arranged to insert a small resistance in the main circuit in order to give the shunt fields more time to increase. This arrangement worked well, and the motors could be switched into parallel on an 8 per cent gradient. It was then found that getting the armatures back into series was even more difficult than getting them into parallel, it being necessary to use more resistance in the armature circuit. This difficulty was, however, overcome in the first series parallel controller that was made on the circular plan. Many motors, however, will not work sparklessly in series with the field weakened sufficiently to produce double the minimum speed, and the controller has therefore been redesigned with three resistance notches for making the series parallel changes. Twelve months after the commencement of the experiments with series parallel working there were 14 cars running with series parallel control on the Yorkshire Woollen District Tramways, and they have never given any trouble.

It can be taken as a fact that any motor which is good when series wound is good also as a regenerative motor.

Safety and Economy.

One of the advantages of this system is that any notch corresponds to a definite speed, and that a car cannot accelerate beyond this and get out of hand. Until lately, however, there was one objection to the regenerative method of

wire. Thus the regenerative brake is not dependent for its action upon the continuity of the supply circuit.

There are four claims for the regenerative brake:

1. It cannot, under any circumstances whatever, or with any condition of the rails, lock the car wheels.
2. If it is out of order the car cannot be moved.
3. It is not dependent on the continuity of the supply circuit.
4. The more you use it the less it costs; in fact, it pays you to use it.

The saving in current varies according to the contour of the route, conditions of traffic, etc. On level lines it is small, but on hilly lines may be as much as 30 per cent. Copies of comparative current-consumption tests on cars on the lines of the Bristol Tramway & Carriage Company over about 44 miles, the South Metropolitan Tramways Company and the Devonport & District Tramways Company are given in the paper. In these three cases savings of 24, 26.7 and 28.7 per cent respectively are obtained. At Bristol and on the South Metropolitan company's lines at Penge the tests were made with special cars unloaded, but at Devonport the meter was fixed on cars running in service, the tests extending over about 54 miles.

A special point of interest in the Penge test is that the total current taken by the regenerative car, before deducting the regeneration, is 6.5 per cent less than the current taken by the series motor car.

THE PROGRESS OF ELECTRICAL EQUIPMENT OF STEAM ROADS.*

BY BION J. ARNOLD.

On a former occasion, in September, 1904, I said: "That electricity will be generally used on our main railway terminals, and ultimately on our main through lines for passenger and freight service, I am convinced, but I do not anticipate that it will always be adopted on the ground of economy in operation, neither do I anticipate that it will come rapidly, or through the voluntary acts of the owners of steam railroads, except in special instances."

Confirming the prediction which I then made, to the effect that the steam railroads would acquire the electric roads paralleling them, I call attention to the fact that according to published reports the New York Central & Hudson River Railroad Company has since then, in addition to practically completing its great electric terminal in New York City, either purchased outright or acquired indirectly the controlling interest in most of the Interurban roads paralleling its lines between Albany and Buffalo, and the New York New Haven & Hartford Railroad has recently acquired practically all the interurban roads which compete with it in its territory.

Projects Under Way.

The Erie Railroad is, in addition to its preparation for the electrification of its terminals in the vicinity of Jersey City, now equipping 34 miles of track extending southeast of Buffalo, thus retaining traffic which might have been taken from it by the construction of competing interurban lines. In like manner the Pennsylvania Railroad system, in addition to the electrification of its great terminal system in the vicinity of New York, is gradually electrifying the Long Island Railroad system. The New York New Haven & Hartford Railroad Company is also going to great expense in the electrification of its line from New York City to Stamford, Conn., a distance of 31 miles, with reasonable probability of gradual extension of electric traction over its system.

These few examples, together with the electrical operation of the great Simplon tunnel, by means of which the traveler will be carried from Switzerland into Italy without the annoyance due to obnoxious gases emitted from the steam locomotive, I believe are sufficiently impressive to emphasize the correctness of the lines of development outlined by me in 1904, involving, as they do, an expenditure of approximately \$100,000,000 for electrical equipment, and a collateral investment of some \$300,000,000 more.

In addition to these general types there are now under construction, or contemplated construction, many special installations adopted for various reasons, such, for instance, as the St. Clair tunnel of the Grand Trunk Railway system, extending from Port Huron, Michigan, to Sarnia, Ontario, wherein steam locomotives will soon be abandoned and trains operated electrically. The equipment of the Cascade division of the Great Northern Railway, over the Cascade mountains, a distance of about 100 miles, although not yet definitely decided, is another notable example of the contemplated application of electricity to steam roads. Its equipment would eliminate the use of steam locomotives now operating over a tortuous piece of road, and through a long and difficult tunnel. Electrification is also contemplated upon a division of the Southern Pacific Railway, through the Sierra Nevada mountains, for the purpose of eliminating the difficulties due to tunnel operation, and of increasing the capacity of the road, which is now limited by the size of the present steam locomotives.

New York Central & Hudson River Railroad Company.

The New York Central Railroad Company has recently put into operation, for passenger service, interurban trains running between New York City and Yonkers, a distance of 14 miles, and is now introducing electric locomotives into the terminal service for operation of its through trains, between the Grand Central terminal and Croton, 35 miles, and North White Plains, on the Harlem division, 29 miles, from New York.

The installation will, when completed, consist of two power stations of 30,000 kw. each, and eight substations which will supply and distribute electrical energy to about 400 miles of track within a radius of 40 miles from the city of New York. The type of locomotive for through train service has, by a long series of experiments, proven itself capable of doing the work for which it is intended. Thirty-five of these

machines are now ready for operation, and will be introduced as rapidly as men can be trained to operate them. Each locomotive weighs 100 tons, has a normal capacity of 2,200 hp. and a maximum capacity of 3,000 hp. and will run at speeds varying from 40 to 80 miles per hour, depending upon the weight of the trains, which will vary from 250 to 900 tons. Two or more locomotives can be coupled together for heavy train service, and operated upon the multiple-unit system in the same manner as the cars.

Two hundred steel motor cars will soon be placed in service, each equipped with 400 hp. of motor capacity, and so arranged that they can be run singly or in multiple, at will, although some are now used as trailers without motor equipments. Each motor car is 60 feet long over all, weighs 53 tons, seats 60 passengers, and is designed to run at a maximum speed of 52 miles per hour.

One power house, in which has been installed 20,000 kw. capacity in turbo-generators and the necessary auxiliaries, is now in service, and the energy is distributed to the trains by means of four substations, in which are placed storage battery auxiliaries for the purpose of regulating the load upon the power stations, and for reserve capacity in case of accident to any substation or power station. From the substations the energy is distributed to the trains by means of secondary copper feeders and the inverted, or under-contact, type of third rail.

Pennsylvania Railroad Company Tunnels.

Beginning at Bergen Hill in New Jersey, about 2.7 miles from the proposed New York City station, and almost directly in line with Thirty-third street on Manhattan Island, the plans of the Pennsylvania Railroad contemplate the construction of two tunnels, each 19 feet in diameter, parallel with each other, from Bergen Hill, through the Palisades, and under the Hudson river, thence under a portion of Manhattan Island to the terminal station located between Thirty-second and Thirty-fourth streets, and Seventh and Eighth avenues in New York City. From this terminal station eastward there will be four tunnels, each 23 feet in diameter, extending across the island under the East river to the terminal in Long Island City, where the tracks will come to the surface, and connect with the extensive yard contemplated by the Pennsylvania system at that point. Through these tunnels, which are about 14,000 feet in length, will be operated, by electric locomotives, all passenger service entering New York City, of the Pennsylvania Railroad, and probably a large amount of freight for the distribution yard at Long Island City. The suburban trains for interurban service passing through these tunnels will be operated on the multiple-unit system, and the electric locomotives will be, as in the case of the New York Central, similarly operated, when it is desired to couple them together.

Hudson & Manhattan Tunnels.

For the purpose of enabling the interurban and other steam roads entering Jersey City to enter the city of New York, there are now being constructed two other systems of tunnels, one under the name of the Hudson & Manhattan Railroad, and the other under the name of the New York & Jersey Railroad. The interests of both companies have recently been consolidated and now operate under the name of the former.

The two tunnels of the Hudson & Manhattan company extend from the foot of Exchange Place in Jersey City to a terminal at Church and Fulton streets in the island of Manhattan, a distance of about 9,000 feet. The tunnels of the New York & Jersey Railroad Company will extend from the foot of Fourteenth street in Jersey City to Morton street on Manhattan Island, a distance of about 5,000 ft.

It will be noticed that the tunnels of both of these companies are considerably smaller than those of the Pennsylvania company. They are constructed for the purpose of feeding the present subway of the Interborough company, consequently all cars entering these tunnels will have to be of the special small and low design now used by the Interborough company, a misfortune which it seems impossible now to overcome, as it will effectually prevent any of the through trains of the steam roads which now terminate at Jersey City entering Manhattan Island unless they come through tunnels of their own to be hereafter constructed.

In addition to the subways heretofore mentioned, to be used for the accommodation of steam railway traffic, there are to be four additional tunnels constructed under the East river, two by the New York & Long Island Railroad Company at Forty-second street, and two under the direction of the rapid transit commission, from the present terminal of the Interborough subway at the Battery to Foreman street in Brooklyn, connecting with the subway under construction

*Presented before the Western Society of Engineers, Chicago, Ill., on January 8, 1906.

to the Flatbush terminal of the Long Island Railroad Company.

It will thus be seen that when the tunnels which are now under construction are completed there will be six under the Hudson river, and eight under the East river, or fourteen in all.

Operation Details.

While certain experimental electric locomotives have been built for operation in the Pennsylvania tunnel, and it is probable that the third-rail, direct-current method of propulsion will be used, I do not understand that the type of locomotive or system of propulsion has been absolutely decided upon.

All cars which will operate through the tunnels of the Hudson & Manhattan company, and the New York & Jersey company will necessarily have to be of the type which will operate upon the direct-current third rail, such as is used in the operation of the Interborough company's subway.

The New York New Haven & Hartford has adopted the single-phase overhead-contact method of train propulsion, and is now engaged in installing and getting ready for operation the most extensive and elaborate single-phase system yet attempted, the outcome of which is being watched with great interest by railroad men.

This company is at present installing electric traction on its system between Woodlawn, where its tracks join those of the New York Central, and Stamford, Conn., 33 miles from New York. Between Woodlawn and Stamford the road will be equipped with overhead working conductor, operating with single-phase, 25-cycle current at 11,000 volts. From this conductor the current will be collected by means of under-contact sliding shoes, transformed to a pressure of about 450 volts by the transformers carried upon the locomotives, and used in the motors as alternating current. Each locomotive is designed to weigh 72 tons, has a nominal capacity of 1,000 hp. and is designed to make 26 to 45 miles per hour, with trains varying from 200 to 250 tons. Several of these locomotives have been delivered and are now being tried out upon the experimental tracks of the company, and it is expected that they will go into practical service as soon as the overhead work and power station equipment can be completed. The company will not at present use the multiple-unit system, but will operate its suburban trains by means of these electric locomotives, 30 of which have been ordered for this service. The overhead construction is divided in sections with suitable circuit breakers at the end of each section which will open automatically in case of a short circuit, or can be manually controlled by the towermen.

St. Clair Tunnel.

In order to eliminate the present objections regarding the use of steam locomotives in the St. Clair tunnel of the Grand Trunk Railway system, extending between Port Huron, Mich., and Sarnia, Ont., the officials of that company decided a little over a year ago to adopt the single-phase method of propulsion. The equipment will consist of six electric locomotives, weighing 120 tons each, having a normal capacity of 1,500 hp., capable of exerting a drawbar pull of 25,000 pounds, at a speed of 10 miles per hour, and a maximum speed for passenger train service of 35 miles per hour.

The power station, which is now well under construction, will contain two 1,250-kw. turbo-generators, either one of which will be capable of operating the tunnel up to its full capacity, the other being held in reserve.

Erie Railroad.

The Erie Railroad Company has a commission organized for the purpose of electrically equipping its lines, now running out of Jersey City, a total of about 250 miles, although it is contemplated that but 35 miles will be immediately equipped, viz.: the division extending from Jersey City to Greenwood Lake. In addition to its suburban lines in the vicinity of Jersey City and its terminal, the road now has under construction 34 miles of single track, known as the Rochester division. This division lies between Rochester, N. Y. and Avon, with a branch between Avon and Mt. Morris. The single-phase alternating-current system will be used, having a working pressure of 11,000 volts on the overhead conductor. The energy will be secured from Niagara Falls at a pressure of 60,000 volts. Six passenger coaches, 54 feet long, and seating 56 people, will be placed in service, each car weighing about 50 tons, and equipped with four 100-hp. motors. These cars will be capable of a maximum speed of from 45 to 50 miles per hour, and of hauling one trailer. While this extension of the Erie system is short, the company has under contemplation the electrical equipment of its entire suburban service surrounding Jersey City, which will

involve an expenditure of some \$15,000,000. Plans are now being formulated for this expenditure.

West Jersey & Seashore Road.

This is a recently electrified branch of the Pennsylvania from Camden, N. J., to Atlantic City, 65 miles. The equipment consists of a power house, 8 substations, and 71 miles of duplicate high-tension line. The service is ultimately to consist of three-car express trains running 60 miles per hour on a 15-minute headway, and local service at 10-minute intervals.

The equipment of this line was done in record-breaking time, the site for the power house having been chosen January 17, 1906, and on July 1st two boilers were under steam with a turbine and auxiliaries running, and car service on the line.

In the substations the line voltage is reduced and transformed from 33,000 volts three-phase, to 650 volts direct-current. Third-rail equipment was used, of Pennsylvania Railroad standard dimensions. These dimensions will satisfactorily operate with equipment of the Long Island Railroad and the Interborough system of Manhattan Island.

The rail is protected at stations and in yards. The cars for service on this line have a seating capacity of 58, are double vestibuled, and are well protected from fire risk. The cars are 55 feet 5½ inches long, and weigh, when fully equipped, 89,000 pounds, being heated and lighted electrically, and equipped with hand brakes and quick-service air brakes.

Southern Pacific Railway, San Francisco.

The Southern Pacific Railway system is making active preparations to change about 20 miles of local steam line for electric traction service. The line extends from the ferry terminal to Alameda and Oakland. Generator station is at Alameda point. The electrical equipment is built for 500 volts direct-current, with overhead trolley and utilizing present tracks. A year has been allowed for this work to be completed, after which time the electrification of the lines may possibly be extended. It is not the intention at present to do away with the steam locomotives, but these will be used to aid the electric service during the rush hours. It is stated that an appropriation of about \$1,250,000 has been made for this work.

West Shore Railroad.

An important piece of equipment for electrical operation is now under construction by the West Shore Railroad system between Utica and Syracuse, N. Y. The work in hand covers a distance of 44 miles, and the passenger schedule provides for limited trains in each direction, making the distance from terminal to terminal in 1 hour and 22 minutes.

Electric power will be furnished by the Hudson River Electric Power Company, which will deliver three-phase 60,000-volt current at the railway company's substation 7 miles west of Utica. There will be four substations located about 10½ miles apart. These will be identical in construction and each will be equipped with two 300-kw. rotaries and necessary apparatus for transforming 60,000 volt three-phase current to direct current for distribution to the rails at 600 volts. The transmission line towers will be of steel. There will be 391 of these towers with normal spacing of 480 feet. Most of the towers are 39 feet high, the highest being 63 feet. The line conductors will be located at the vertices of an equilateral triangle 7 ft. on a side. The third rail construction is the Wilgus under-running protected type. The company will operate 15 closed cars, 49 feet over the bumpers, each equipped with four 75-hp. motors per car, and multiple-unit control.

Spokane & Inland Railway Company.

This is a single-phase line between Spokane, Washington and neighboring cities, having a total mileage of 114. The capital invested in the project is approximately \$3,500,000. The service includes passenger, mail, express and car-load freight. The power is purchased from the Washington Water Power Company and is delivered to the railway company as three-phase 60-cycle current at a frequency-changing station 10 miles south of Spokane. This station has four frequency changers each of nominal 1,000 hp. capacity which convert the current to 25-cycle 2,200-volt single-phase current. For transmission to the substations this 2,200-volt current is stepped up to 45,000 volts and transmitted to 15 substations where it is stepped down to 6,600 volts for direct connection to the trolley circuits. The cars and locomotives operate on three different voltages at different parts of the line.

The cars are equipped with four 100-hp. alternating-current motors. The locomotives use the same type of

motors but have a capacity of 150 hp. each. Both the locomotives and coaches may be operated on the multiple-unit system. The locomotives are capable of handling seven standard freight cars, fully loaded, at 30 miles per hour, on level track. The locomotives weigh 49 tons each and have a length over the bumpers of 29 feet.

European Work.

Some recent installations may be of interest. Progress is being made on the tunnel work under the Seine for additional lines to the Paris Metropolitan Railway.

The project for the tunnel under the English channel between Calais and Dover has acquired a new interest and is a subject under much discussion. The proposed tunnel would be 18 feet in diameter, the submarine portion being 24 miles in length with approaches 6 miles in length and of course would be operated electrically. This tunnel is designed to carry the rolling stock of the principal European railroad companies.

The Simplon Tunnel Locomotive.

The locomotives are designed to allow two normal running speeds which are obtained by the proper switching of the circuit. Power used is from 3,000-volt three-phase 15-cycle circuits and provides the two standard speeds of 25 and 40 miles per hour. They are designed to pull a total load of 440 tons including the locomotive, this condition to hold good even with reduction of line pressure as low as 2,700 volts.

A trolley is mounted on the roof at each end of the locomotive and works against the overhead wire, the design of this trolley being a special feature of this locomotive. The lower parts have the form of a parallelogram which can be raised or lowered by air pressure. The upper arm which carries the trolley contact is made very short and light and has a limited motion to either side.

Conclusions.

From what has been said it can be seen that rapid progress is being made in the application of electricity to steam railroads. Some installations have been made on account of the economy in operation to be effected, and the increased earning capacity to be gained, while others have been made under public pressure.

With the completion of the work now under construction by the New York Central and the New York New Haven & Hartford Railroad companies the steam locomotive will disappear forever from the island of Manhattan, and its surrounding territory.

From an examination of the map of the business district of Chicago, bounded by Sixteenth street, Halsted, Chicago avenue and the lake, it will be seen that 23 per cent of this area is occupied by the tracks of steam railway companies. In view of the present state of the art of electric railroading the right to vitiate the air of our congested districts by the emission of large quantities of carbon dioxide from the stacks of numerous locomotives is as questionable as the right to foul the air by the stanches from our stockyards. As there is now a possibility of the removal of these yards from our midst, is it unreasonable to hope that all of the steam railroad companies, through the wise foresight of their officers, may help to purify and beautify the city, by assisting the general movement now under way by our progressive, civic bodies for this purpose? In my judgment, at least one, and probably three of the companies now operating in the city of Chicago can afford to and would profit by the electrical operation of their suburban trains.

Women Street Car Conductors.

The most remarkable feature of the Valparaiso street car system is its conductors; they are women, writes a correspondent of the *Los Angeles Times*. The sex is also employed in like capacity in Santiago and all the other cities of Chile that have horse or electric trams. This practice sprang into being at the time of the revolution of 1891, when men and money were scarce and women plentiful. Having apparently given satisfaction to their employers during the intervening years, they are still retained. To a foreigner if is an interesting sight to observe the streetcar girl, to note how capably she manages her car, and the quiet, business-like way in which she goes through the routine of collecting fares, giving change, discharging passengers and seeing that the rule regarding the number admitted is not broken.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B.

Little Rock Railway & Electric Co. v. Goerner (Ark.), 95 S. W. Rep. 1007. July 23, 1906.

A street railway, the supreme court of Arkansas says, may make and enforce reasonable rules to facilitate its business, and to protect itself from fraud and imposition. So long as these rules are not inconsistent with the rights of the public to transportation over the company's road, and do not impose unnecessary and unreasonable burdens upon them, they will be enforced.

EXPENSE OF REMEDYING DEFECT COMPETENT EVIDENCE RELATIVE TO WANT OF CARE.

Haskell v. Manchester Street Railway (N. H.), 64 Atl. Rep. 186. June 5, 1906.

The amount of expenditure required to have remedied the defect from which the plaintiff received her injury, the supreme court of New Hampshire says, had some tendency to show whether the defendant was guilty of a want of care in not making repairs before the accident. The evidence was competent.

DUTY TO TOBACCO USER STANDING IN VESTIBULE AS REQUIRED.

Goodloe v. Metropolitan Street Railway Co. (Mo. App.), 96 S. W. Rep. 482. July 2, 1906. Rehearing denied Oct. 1, 1906.

The Kansas City court of appeals says that counsel for the defendant appeared to think that the plaintiff was at fault in choosing to stand in the vestibule instead of seating himself in the car. The defendant did not raise the issue of contributory negligence in its answer, and therefore that issue was not in the case. But had it been presented, the fact suggested would not have sufficed to make the plaintiff's conduct an issue for the consideration of the jury. The plaintiff had the right to indulge in the use of tobacco during the transportation, and was riding in the part of the car provided by the defendant for such passengers. The defendant impliedly invited him to be there if he chose, and in no manner was relieved from the performance of the duty it owed him as a passenger by his acceptance of the invitation.

MOTORMAN AND CONDUCTOR ON ONE CAR FELLOW SERVANTS OF THOSE ON ANOTHER CAR FAILING TO TURN ON BLOCK LIGHTS—SUFFICIENCY OF SINGLE-BLOCK SYSTEM.

Berg v. Seattle, Renton & Southern Railway Co. (Wash.), 87 Pac. Rep. 34, Sept. 24, 1906.

On a portion of a single-track electric street railway between two streets 1,665 feet apart where there were sidings and none between, a single-block block-light system was constructed, consisting of five poles about an equal distance apart, on each of which poles were two red incandescent electric lights, those on the north sides of the poles being turned on by a rope or lever at the south end, while those on the south sides would be turned on at the north end of the block, the lights being for use in the night-time and foggy weather, and the motormen on all cars being required to turn the lights on when entering the block and the next car back being required to turn the lights off, it being the duty of the conductors to see that the motormen turned the lights on and off. The supreme court of Washington holds that the motorman and conductor on one car entering the block from one end were fellow servants of the motorman and conductor on a car entering it at about the same time at the other end, so that the company would not be liable to the motorman of the first-mentioned car for injuries sustained in a collision caused by the failure of the motorman and conductor of the other car to turn the lights on. And the motorman of the first-mentioned car having testified that, if the motorman on the other (south bound) car had turned his lights south when he entered upon the block, the

accident could not have occurred, because in that event the witness would have seen the lights and remained at the end of the block or returned to that point, the court holds that this indicated that the system was sufficient for the purposes for which it was intended, and was reasonably safe, which was all that was required.

RUNNING OF CAR WITHOUT LIGHT FROM TROLLEY POLE HAVING LEFT WIRE.

Higgins v. St. Louis & Suburban Railway Co. (Mo.), 95 S. W. Rep. 863. June 19, 1906.

An electric car collided with a wagon after dark of a November evening. The evidence showed that the light upon the car went out at a point about 250 feet back, by the trolley pole leaving the trolley wire, by which the car was divested both of light and motive power. How this happened to be done was not explained by the evidence. Whether this failure to have the light was the negligence of the defendant's agents whilst running, conducting, or managing the car, or of some independent cause was not made to appear from the evidence. All that did appear was that the trolley pole left the wire, and that the conductor immediately tried to replace it. Under these circumstances the supreme court of Missouri, division No. 1, concludes that there was not sufficient evidence to sustain the ground of alleged negligence of failure to have a light upon the car. Moreover, the court says that it cannot conclude that because the streets and crossings mentioned were within the corporate limits of a large city that they were such as would require a reduced rate of speed in approaching them even without lights upon a car.

LIABILITY FOR OBSTRUCTING FLOW OF WATER OF COMPANY BUILDING ROAD AND ITS SUCCESSOR—DUTY OF LATTER TO EXAMINE ROADBED AND TRACK TO SEE THAT THERE ARE THE REQUIRED OPENINGS.

Ft. Smith Light & Traction Co. v. Soard (Ark.), 96 S. W. Rep. 121. June 18, 1906.

A company which was this traction company's predecessor, and required by city ordinance to construct its tracks with suitable bridges, drains, or pipes at all gutters, so as to permit the flow of water under the same, built its roadbed across a depression or drain which crossed the street, without putting in a culvert or drain for the water to pass through, thus forcing more water to pass under a nearby existing bridge over a creek, where it also partially obstructed the creek by placing a bent under the bridge, with the supports resting in the bed of the creek. Having altered the flow of water in that way, it became the duty of such first company, the supreme court of Arkansas says, to see that this creek should not become further obstructed, and the contention that it was guilty of no wrong in this respect could not be sustained.

The contention that this traction company could not be held responsible for the injury from thus obstructing the flow of water and causing it to back up and enter a store, in the absence of notice that the solid roadbed and the bent under the bridge obstructed the water and were nuisances, because this traction company did not construct the roadbed or erect the posts and bent under the bridge, the court also does not consider sound, the ordinance under which the road was constructed requiring of the company constructing it, "its successors and assigns," that the roadbed should be constructed and maintained with suitable bridges, drains and pipes to permit the flow of water under the same. When it purchased this railway and took charge of it, this traction company, the court says, assumed the burden of complying with this ordinance. It could not escape by saying that it had no notice. It was its duty to exercise ordinary care in examining its roadbed and track, and in seeing that it had the required openings, and that such openings or drains

as were already there were not allowed to become filled up and obstructed, so that the water could not pass through. If it failed to exercise due diligence in this respect it was guilty of negligence, and must pay the damages caused by such negligence.

NO LIABILITY FOR NEGLIGENCE OF VOLUNTEER ASSISTING EMPLOYEE OF AN INDEPENDENT CONTRACTOR FOR FIREWORKS AT AMUSEMENT PARK.

Noggle et al. v. Carlisle & Mt. Holly Railway Co. (Pa.), 64 Atl. Rep. 547. May 14, 1906.

The defendant company contracted with a dealer for an exhibition of fireworks in a park on the line of its railway. By the terms of its agreement the dealer was to select the fireworks from his stock, to have them exploded, and to make the best display that could be made for the price agreed upon. The company procured extra policemen for the occasion to preserve order in the park, but it did not reserve nor exercise any supervision or control of the exhibition, which was placed by the dealer in the exclusive charge of a competent employee. During the course of the exhibition a piece known as a "flowerpot" failed to explode, and the father of the man in charge, who was assisting him merely as a volunteer, handed it to a boy 12 years old and told him to take it away and have a good time with it. He took it some distance from the crowd, touched a lighted match to it, and was injured by its explosion. A verdict was directed for the defendant. The supreme court of Pennsylvania affirms the judgment in the company's favor. It says that the company properly policed the park, provided a suitable place for the exhibition, and placed it in charge of a competent person. The negligence that caused the injury was that of a volunteer assisting the employee of an independent contractor. For this the company was not answerable.

NO LIABILITY FOR INJURY TO INEXPERIENCED WOMAN WITH INFANT IN ARMS FALLING BETWEEN PLATFORMS OF CARS ON ELEVATED ROAD—REQUEST TO "MOVE QUICKLY" NOT UNREASONABLE—NO DUTY TO WARN OR ASSIST SUCH A ONE—CARE REQUIRED OF HER.

Hawes v. Boston Elevated Railway Co. (Mass.), 78 N. E. Rep. 480. June 20, 1906.

The plaintiff, with an infant in her arms, had got on the platform of a car of one of the trains of the elevated railway, and was in the act of entering the door when the brakeman spoke up sharply and said: "Smoking car, madam; you can't go in there; cross over into the front car, and move quickly." In attempting to obey him she fell between the platforms of the cars and was injured. The space between the two platforms at its narrowest part was 7 inches and 11 inches wide in its widest part, the ends of the platforms being so constructed that both curved away from each other. The supreme judicial court of Massachusetts sees no evidence of negligence on the part of the defendant. It says that there was nothing to show that the space between the cars could have been made any less or that the ends of the platforms could have been made any different. The defendant was not bound to warn the plaintiff of the space between the cars, or to assist her in crossing from one to the other and the brakeman's request to move quickly was not, in view of the nature of the defendant's business, an unreasonable one. Whether the plaintiff was in the exercise of due care need not be decided. But it would seem that for her to step from one car to the other without looking down was hardly consistent with the exercise of due care on her part. The infant in her arms and her own inexperience and weakness would seem to have called for the exercise of more care, instead of serving as an excuse for the exercise of less care.

PIPING & POWER STATION SYSTEMS.--XXVI.

BY W. L. MORRIS, M. E.

The arrangement as shown in Figure 236-(H11-1) has an outside water-circulating tank and an admission valve, a, discharging water through a syphon-T, thus bringing about a forced circulation when the valve is open. It is desirable to place the storage tank as high as possible, thus increasing the velocity for circulation and raising the overnow, b, to a height sufficient for discharging into the open heater. To insure the water passing over the entire surface of the water box the tube, c, is attached to the end of the inlet

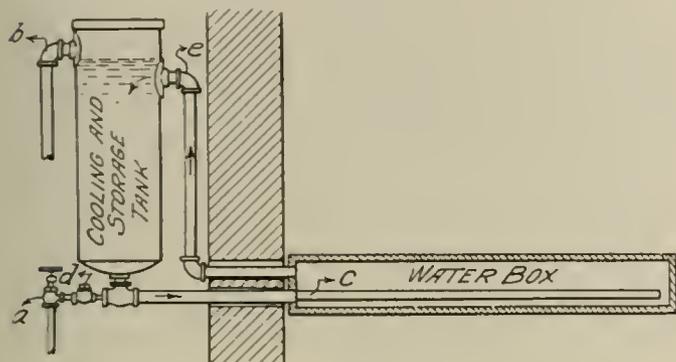

Figure 236--(H11-1).

pipe. To permit of free circulation the connections from the tank to the water box should be of large size and arranged in as direct a line as possible. To prevent the possibility of water wasting away through the supply pipe, if for any reason the pressure on it should drop below that at the inlet pipe, a check valve, d, should be placed in the inlet pipe. With connections as shown when the water becomes very hot it will boil in the tank and give sufficient warning to the operator so that he may know when to alter the set of the valve, a, and prevent any damage. To allow for the boiling away of part of the water without lowering its upper surface below the inlet, the connection, e, should be made lower than the outlet, b. Unless this precaution is taken when the water level is lowered below e, circulation through the water box will be entirely stopped.

It may be advisable to consider the merits of some of the devices using fire tile in place of water-cooled boxes and designed to do the same work. The water-cooled parts are used to save the expense of fire tile destroyed by the high temperatures to which they are subjected. In many cases it costs more to maintain the water-cooled part than to replace the tile, but as a means of comparison note may be taken of the heat wasted with the water box. (This is the usual method of comparison.)

For a water box in a 500-horsepower boiler, lying close to the grates and away from the direct flame, taking water at about 50 degrees and discharging at 200 degrees, about two gallons of water per minute are required. This change in temperature requires an expenditure of 280 B. t. u. per minute and assuming that the boiler is in service 80 per cent of a year's time, the total for the year would be 117,731,100 B. t. u., or at 33,395 B. t. u. per hour this will be equivalent to 3,535 horsepower hours. If 5 pounds of coal are used per boiler-horsepower hour this would represent 17,675 pounds of coal, costing about \$16. The tile required would ordinarily cost about three dollars, and the setting a like amount, thus making it possible to renew the fire tile three times a year without any excess cost over that for the heat lost in the wasted water. This argument does not take into consideration the cost of pumping the water nor for maintaining the water-cooled device.

It is often found that attempts to save repairs are more

expensive than the cost for the repairs themselves. This has been found to be the case with supported flat arches made of tile and designed with ventilation space to prevent the support from being burned.

It has been found by experience that it is economical to have a self-supporting igniting arch in a boiler furnace. Such arches are free from metal supports and their temperature may become very high, in fact much higher than the melting point of iron. These arches bring about such a saving of fuel as to economically permit of the renewal of the arch every six months and then save money when compared with the ventilating type of construction.

Small losses in a power plant are not easily noticeable, and in fact are quite difficult to measure. If only 1/10 of a pound of the steam generated by each pound of coal is sacrificed this loss will amount to about 1.5 per cent. With a 500-horsepower boiler, which would burn about 7,500 tons of coal per year, this percentage of loss would approximate with coal at \$2 per ton, \$225 per year per boiler. A great difficulty in station operation is the fact that everybody can see when a dollar is spent, but nobody can see the effect of saving ten times this amount by careful operation. Money spent for coal is looked upon as a necessary expenditure, but that spent for renewals and repairs is usually viewed as an unnecessary charge brought about by careless management or defective apparatus.

Low-Pressure Water from Economizer to Heating System.

In many power plants hot water serves best for heating service. If there is available an abundance of exhaust steam it will probably be good practice to use it for heating the water in a large heater. For a condensing plant the heating problem becomes somewhat more difficult. A heating system should be under low pressure. This precludes the use of water taken direct from the boiler.

The higher the pressure carried by a condensing plant the more suitable would be the use of low-pressure economizers; with the lower pressures the strains in the economizers would be comparatively small and a supply of water suitable for heating would be available.

In Figure 237-(H12-1) is shown an economizer arranged for operation at low pressure. With this arrangement pump No. 1 serves to keep the economizer under pressure and discharge hot water either to feed pump No. 2 or circulating pump No. 3. By closing valves a and b, the heating system is entirely shut off from the economizer.

If the quantity of water passing through an economizer

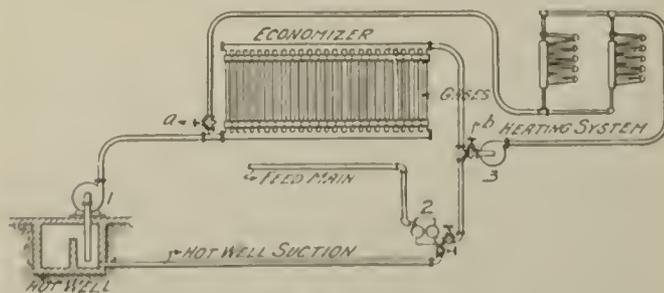

Figure 237--(H12-1).

is considerable the temperature of the flue gases and the water will be lowered. In ordinary practice an economizer delivers to water passing through it about 1/6 as many heat units as the boilers, or, in other words, it has about 1/6 the capacity of the boiler equipment. By increasing the quantity of water passing through the economizer the temperature of the gases is lowered, thus increasing the capacity of the economizer to possibly 1/4 that of the boiler plant. In other words, an economizer equipment for 1,000-horsepower boiler capacity will raise the water for heating purposes to

a temperature approximating that which would be done with 250-horsepower capacity of independent hot-water heaters.

It will not be found advisable to use over 10 per cent of the total capacity of the boilers for heating purposes, as there will be times when only part of the boilers are in operation, and by using water from the economizer for boiler feeding the supply capacity for the heating system will also be decreased. With large power plants, say of 5,000 boiler-horsepower capacity, only about 3 per cent of the output will be required for heating, possibly 150 horsepower, and this duty can readily be performed by the economizer with no perceptible change in water or flue-gas temperatures. The efficiency of a heating system so arranged would even be higher than that of a steam plant not having a heating system in connection with its economizers, since the arrangement as suggested would utilize heat that otherwise would be wasted.

Low-Pressure Water to Plumbing Fixtures.

In nearly all power plants both hot and cold water are required for the plumbing fixtures and, therefore, a low-pressure supply is necessary for this service. The light float valves furnished with water closets, basin cocks, etc., are only suitable for low pressures of about 20 pounds. These valves operate well on much lower pressures, but under such conditions for pressures of about five pounds, require somewhat larger lines.

If a low-pressure water tank forms a part of the power plant piping system the cold-water service should be taken from this supply. Water would then be available for closets and washbowls, even though the pumps were in use for other service. If only a small quantity of low-pressure water is required, say 500 gallons per day, it may be advisable to use city water if it is available. It must also be remembered that as the quantity of water required is reduced the size and cost of the necessary storage tank and its supports are also reduced in direct proportion. For supplying such small tanks the feed pump may be shut off from the boilers long enough to allow the tank to be filled once a day.

To determine whether a tank or city main supply should be used it is necessary to estimate the yearly cost of city water as compared with the cost of raising water to a supply tank, taking into account interest and depreciation and noting what saving there is with one system as against the other. If the saving is small it is always better practice to eliminate any equipment that requires attendance, repairs, etc. This may lead to a decision in favor of city water. It should be remembered in estimating the quantity of water used that one is apt to disregard waste caused by apparatus out of order.

The supply of hot water to plumbing fixtures is usually a difficult detail to arrange. This subject is discussed under Class D10, "Branches to Hot-Water Plumbing Fixtures," and in Class A31, "Steam for Heating Purposes."

Generally speaking, there are available three systems for supplying hot water to plumbing fixtures. The first uses feedwater of high pressure and temperature, requiring high-pressure valves and fittings. The second uses hot feedwater with a reducing valve and standard low-pressure plumbing fixtures. The third employs a steam water-heater using water from a low-pressure main with standard low-pressure plumbing fixtures.

If the plumbing contract is let before this subject has been given sufficient consideration the fittings supplied will undoubtedly be of the low-pressure type and, therefore, the hot-water supply must be under low pressure. Many misfits in power station piping systems are brought about from this cause of ordering parts which in themselves may have commendable qualities, but which fail to conform to the requirements of the other parts of the general station system.

In the ordinary power plant there are only a few hot-water taps required, and for this reason it is better to take the trouble at the time of building to secure high-pressure valves than to afterward be burdened with the care of automatic devices required by low-pressure hot-water systems.

Low-Pressure Water to Separate Buildings.

If the location of the power plant under consideration is such that it is advisable to furnish warm water to car shops, offices or similar nearby buildings, it will be found quite objectionable to take this supply from the feed mains since they should be left for boiler feeding with the least possible number of unnecessary connections. If a comparatively large quantity of water is required for outside feeding another supply should be arranged, designed for low pressure. If there is an abundance of exhaust steam the simplest way would be to take low-pressure cold water from the regular low-pressure system and allow it to pass through a small exhaust heater used especially for this purpose. If the exhaust steam is less than that condensed by the boiler feedwater heater then this independent heater should be placed ahead of the feedwater heater, thus first raising the temperature of the water in it to about 210 degrees, even though the feedwater heater may not raise the temperature of its water above 150 degrees or less. If all the exhaust steam is condensed in heating the feedwater then the live steam heater shown in Figure 132-(A32-2) is quite as economical as an exhaust heater.

If it is necessary to pipe both live steam and low-pressure cold water for a considerable distance to the outside buildings where hot water is also required, and if the steam is always turned on and the exhaust is condensed for feedwater, then the use of a live steam water-heater would be the more economical method of furnishing hot water. Thus less water would be

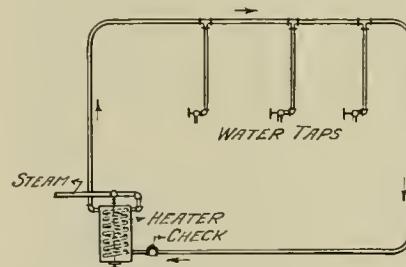

Figure 238-(H14-1).

the cold water in the pipes when it is desired to get the warm water. The live steam heater has another advantage in that the temperature can be regulated and that all the condensation may be delivered to the water-heater by taking steam from the bottom of a drip pocket. This practice will save drips which otherwise might be wasted to the sewer.

If the plant is operated with the engines exhausting to atmosphere then all these small savings gained by using a live steam heater are of no consequence because such heat secured from the exhaust is obtained without any expenditure for fuel.

If it is necessary to place the steam water-heater in an outlying building it may be found advisable to lay out the hot-water piping on the loop system. This will keep the water in circulation so that it will be warm throughout all the piping. Figure 238-(H14-1) shows such an arrangement of piping from which hot water may be instantly drawn without drawing off the water in the main.

(To be continued.)

A meeting of the general committee in charge of arrangements for the great electrical exposition which is to be held at Niagara Falls in 1908 was recently held in that city and the general opinion expressed by members of the committee was that the success of the project was assured. An important step was taken in the appointment of subcommittees to arrange details. These committees will meet in the near future for the purpose of forming a permanent organization.

News of the Week

Plans to Relieve Brooklyn Bridge Congestion.

Bridge Commissioner Stevenson on January 4 submitted to the board of estimate the report of the special commission of engineers appointed to devise a way of relieving the Brooklyn bridge crush in the shortest possible time. The commission consisted of Prof. William H. Burr, William Barclay Parsons and Ira A. McCormack. The report was accompanied by a letter from Mr. Stevenson approving the report and asking the board to authorize the issue of \$3,250,000 of corporate stock of the city for the purpose of carrying out the plans.

The outline of the report, as given in Mr. Stevenson's letter is as follows:

"I submit herewith a plan showing the proposed reconstruction and enlargement of the present Manhattan terminal of the Brooklyn bridge, and also a plan for carrying trolley cars over Sands street on the Brooklyn side of the bridge. The general scheme is to transfer the present trolley car stands on the bridge by means of a subway connection to sub-surface stands west of Park Row on property recently acquired by the city, thus making it possible to provide eight pockets in the space occupied by the present terminal building, for the seven lines of elevated trains now crossing the bridge. For quick relief it is proposed to extend the structure across Park Row, which can be built in six months from the time of letting the contract. This temporary structure must of necessity be removed before the permanent plan is carried to completion. The operating company assures me that this will permit it to operate six-car elevated trains without change at Brooklyn. When the station as proposed is completed it will be possible to run trains on the bridge at the rate of 15 miles an hour on a headway of 45 seconds, thus increasing the capacity of the bridge in the rush hours about 25 per cent. The plans submitted provide for a possible connection between the bridges by subway or elevated loop."

The board postponed consideration of the report for a week.

The rapid transit commission after its meeting on January 8 sent a letter to the board of estimate recommending the building of a subway loop, connecting the Williamsburg and Manhattan bridges, running down Centre street to a point near the Brooklyn bridge and thence down William street to the financial district. The route is almost like the proposed McDonald plan, submitted on December 27. The commission believes that this system can be built for \$12,500,000, exclusive of the cost of real estate, and that it can be completed by the time the Manhattan bridge is in operation, in 1909. The further important suggestion is made that the line built over this route would be very attractive to a lessee, and that it could profitably carry passengers for a three-cent fare. If the board of estimate concurs in this recommendation, the plans for the system will be hurried forward, so that practical work can be got under way at an early day. Chief Engineer Rice has already begun on the plans. The commission took no action with reference to the proposed elevated loop between the bridges.

Cleveland Traction Developments.

The long-expected decision of the United States supreme court in the Cleveland Central avenue franchise case was handed down on Monday, January 7, by Justice R. W. Peckham. The court decided that the Cleveland Electric Railway Company's franchise in Central avenue, S. E., Quincy avenue, S. E., and East Ninth street, expired on March 22, 1905, and that the Forest City Railway Company's franchise over the same streets, granted in 1904 as a renewal of the former grant to the old company, was invalid. This decision, which it was hoped would clear up many important points of the spectacular controversy over the right to furnish transportation facilities to the people of Cleveland, leaves the situation exactly where it was before. The case had been appealed from the decision of Judge R. W. Taylor, of the United States circuit court of the northern district of Ohio.

In 1904 the city council granted a franchise to the Forest City Railway over the streets named, which were already occupied by the Cleveland Electric Company, which claimed that its franchise was perpetual, or at least good until 1913. The old company applied to Judge Taylor for an injunction restraining the low-fare company from making use of its franchise and the city from removing or confiscating the tracks. Judge Taylor, in granting the injunction, said that the Cleveland Electric franchise expired on March 22, 1905, and that the Forest City franchise was invalid because it had been granted as a renewal of the old franchise. On October 31, 1906, the supreme court granted a temporary injunction pending the final decision, restraining the city from stopping the Cleveland Electric cars on East Ninth street. The case was argued on November 12 and 13.

The Cleveland Electric Company based its principal claim on the point that the language of various extension ordinances had treated its lines as a complete system and that the life of the entire system had thereby been extended co-extensively with the life of the longest franchise of any of its constituent parts. This claim the court denied. The court declared that the lines were not shown to have been of necessity operated as one and the same system and that it manifestly was not the intent of the city council to treat of them as such. Therefore the court holds that the franchise over the streets named in Central avenue, S. E. and Quincy avenue, S. E. expired in 1905. Furthermore, refusing the extension of the franchise for the city, the court holds that

neither the Forest City company nor the city has rights in the property of the Cleveland Electric now in the streets.

The Cleveland Electric company is still operating cars over the streets in question, which are among the most important in the city, and immediately upon report of the decision sent a communication to the city council stating its intention of bidding for new franchises. In July, 1906, the company agreed to reimburse the city in case it was finally decided it had no rights in the streets.

At a meeting of the city council on January 10 the Cleveland Electric company presented an offer to continue to operate the lines on which its franchises had expired on a three-cent fare basis, from now until the advertisement and sale of new franchises over those streets. If the receipts of the company for those lines show any surplus the excess is to go to the city. The company has also shown a readiness to come to an agreement at once in regard to the compensation to be paid for the use of the streets since the franchises expired.

Chicago Traction Situation.

Although the demand on all sides for an immediate settlement of the traction controversy has become more insistent each day, from both individuals and civic organizations, the ordinances have not yet been reported to the city council. A new ordinance, under the name of the Chicago Railways Company, which is to take over the lines controlled by the Chicago Union Traction Company, has been submitted. This draft guarantees to furnish a perfect title to the property in case of purchase by the city and contains the other agreements made between Mr. Walter L. Fisher, city traction counsel, and the company's representatives at Atlantic City two weeks ago.

Mayor Dunne is still persistently holding out for a referendum vote before the ordinances are finally passed, and on Monday, January 7, sent a message to the city council asking it to re-adopt the Foreman resolution of October 16, 1905, which declared it to be the sense of the council that the procedure in dealing with any ordinance for the settlement of the Chicago street railway question should provide for a referendum. After an exhaustive discussion by the council a motion to adopt the resolution under suspension of rules was lost by a vote of 40 to 26, many aldermen who had been considered among the mayor's following on the traction question voting against it.

On the day following this defeat of his plans at the hands of the city council the mayor had published in several newspapers an open letter addressed to the citizens of Chicago asking them to co-operate with him in preparing a referendum petition, which requires the signatures of 25 per cent of the registered voters, or \$6,000 names, before February 1. He said that if private citizens, organizations or newspapers would not do so, he would personally circulate a petition among the voters, asking the election commissioners to place upon the ballots the question as to whether the ordinances should be passed.

On January 7 the Chicago City Railroad Company was incorporated by T. E. Mitten, John P. Wilson and Edward Morris, with \$100,000 capital stock. Mr. Mitten, who is president of the Chicago City Railway Company, is named as president. Objection has been made that the ordinance provides for the extension of the Chicago City Railway to the north and west sides in event of failure of the Union Traction Company to accept the ordinance, although the South Side company's charter does not provide for such an extension. The new incorporation gives the company the right to operate in any part of the city and thus removes the objection. Mr. Fisher has drafted a new section of the ordinance, providing for the manner of the extension to the north and west sides if such a procedure should be necessary.

Since the first of the year books have been kept by the Chicago Union Traction and Chicago City Railway companies to show the amounts the city would receive from the net receipts on the basis of the plan provided for in the ordinance, making the city a partner in the business. As provided in the ordinances, 65 per cent of the net earnings have been credited to the city and 45 per cent to the companies.

The city's share for the first seven days of the year amounted to \$311,322 from the Chicago City Railway Company, and \$13,693 from the Chicago Union Traction Company, a total of \$35,015, or \$3,645 a day. This average maintained for a year would mean \$1,330,425 income to the city. Opponents of the proposed ordinance have contended that under the plan of dividing net receipts there would be nothing left as the city's share of profits.

At a meeting of the local transportation committee on January 19 both ordinances were presented in complete form by Mr. Fisher. Mr. Fisher also presented a new plan, which had been agreed to by the companies, that the ordinances should be reported to the council as soon as possible, probably at its next meeting on January 14, but should not be acted upon until February 4. This plan would allow the required time for getting up the referendum petition and would involve an amendment to the ordinance making their validity conditional on a vote in their favor at the April election, in case the petition receives the required number of signatures. Mr. Fisher also called attention to amendments whereby the partnership contract between the city and the companies is made to date from February 1 instead of January 1, shifting the dates for possible acquisition of the property by the city from January 1 and July 1 to February 1 and August 1. The committee accepted the following amendments: A clause strengthening the right of the city to build a subway system regardless of the provision under which the companies will be required to advance part of the cost, a provision that in case the Mueller law is held invalid the city can purchase and operate

under authority subsequently acquired; all rights of the companies cease when the city or its licensee purchases and the licensee acquires only the rights the council may grant at that time; all mortgages on the property must have the consent of the city; either the city or the companies may apply to the courts for the removal of any engineer on the supervising commission for fraud, corruption, or incompetence; in the event of a failure on the part of the Union Traction interests to accept their ordinance the City Railway will extend its lines to the west side and to the north side under the authority of the City Railroad Company.

Ten-Cent Fare Contention Sustained.

In a decision handed down on January 8 the court of appeals of the state of New York confirms the right of the Brooklyn Rapid Transit Company to charge 10 cents fare on its Coney Island lines. The troubles leading up to the submission of the case to the courts were set forth in the Electric Railway Review for August, 1905, together with a statement from President Winter giving the railroad company's side of the case. The decision of the court was unanimous and on account of the importance of the principle involved considerable extracts from it are given as follows:

"It is true that the defendant was incorporated as a street surface railroad; that it has constructed, owns and operates a street surface road within the city of Brooklyn, and in case it leases, operates any other street surface railroad within that city it must furnish transportation over such leased connecting road for one fare, but such is not the case we have under consideration.

"The roads which it has leased and is operating which are involved in this case are not street surface railroads but are elevated and steam surface roads. The contention on the part of the state is that the defendant's powers were limited to the operation of street surface roads, and that when it undertook to lease and operate elevated and steam surface roads they were brought within the provisions of sections 101 and 104 (street surface railroad provision), and that those sections should be construed as applicable thereto. We are of the opinion that this contention cannot be adopted.

"While the defendant was organized as a street surface railroad and was incorporated as stated, the general railroad law has authorized and empowered it to lease the elevated and steam surface railroads in question.

"We think it apparent, therefore, that when the legislature authorized the defendant to lease and operate the elevated and steam surface roads in question it not only became empowered and authorized, but it was also its duty to operate such roads in accordance with the requirements of their respective charters.

"Having had cast upon it the duty and obligation to operate such roads in accordance with the requirements of their charters and the statute applicable thereto, as such lessee, it became entitled to all of the privileges and benefits authorized by their charters and the statute, unless such roads are brought within the meaning of the sections referred to in Article IV, in which the defendant is limited to the charge of but one fare. We think that they are not. As we construe those sections they have reference to street surface railroads and no others.

"A corporation operating a street surface railroad is prohibited from charging more than fare for one continuous ride from any point on its road, or on any road, line or branch operated by it or under its contract, to any other point thereof or any connecting branch thereof, within the limits of any incorporated city or village, if the right to construct such branch or extension shall have been acquired under the provision of such chapter or of this article.

"This provision has reference to street surface railroads, railroads which were constructed under the provisions of such chapter or of this article, distinctly referring to those roads which were constructed under the provisions of the statute pertaining to street surface railroads. Nor do we think that the defendant in dispensing with steam as a motive power and substituting electricity affected the situation or changed its right so far as the question of fares are concerned. Such change has been authorized under general laws, and by complying with the requirements of the statute with reference thereto it may be lawfully made.

"The reasons that control the legislative mind in adopting this statute may not be important. It is quite possible, however, that the fact that the cost of the construction of elevated roads being many times greater than of street surface railroads was one of the reasons why it did not see fit to place them upon the same footing as to fares. Whether the elevated and steam surface roads in a city should be placed upon the same basis with street surface railroads with reference to fares and the transfer of passengers, is a question for the determination of the legislature and not for the courts."

Officers' Pension Fund.—The Montreal Street Railway Company is studying the subject of pension funds with a view to establishing such a fund for officers.

Increased Transfer Privileges in Philadelphia.—The Philadelphia Rapid Transit Company, in response to a request of the Northwest Business Men's Association, recently announced that it has decided to establish 12 new transfer points in the northwestern part of the city and that the new plan would be put into operation as soon as the transfers could be printed.

Proposed Change in Indianapolis-Ft. Wayne Route.—It is announced that a change will soon be made in the routing of the through limited cars from Indianapolis to Ft. Wayne over the Indiana Union Traction Company's lines and those of the Ft. Wayne & Wabash Valley. At present the route is via the Ft. Wayne

& Wabash Valley from Peru to Ft. Wayne. Under the new plan the cars will use the Indiana Union tracks from Indianapolis to Bluffton via Anderson and Muncie, and the Ft. Wayne & Wabash Valley from Bluffton to Ft. Wayne. The new route would reduce the mileage from 135 to 122 miles.

Bill for Ten-Hour Day.—At the instance of the Albany Street Railway Employees' Association a bill is to be introduced into the New York legislature at the next session which will provide for a maximum working day of 10 hours, and a five-minute layover at the end of each run. There is already a law restricting the length of the working day to ten hours in cities of over 100,000 population.

Limited Service Between Dayton and Indianapolis.—On January 1 the Indiana Columbus & Eastern Traction Company instituted new limited service between Indianapolis, Ind., and Dayton, O., by way of Richmond, Ind. Limited cars leave Dayton at 9 a. m. and 2 p. m., arriving at Indianapolis at 1 p. m. and 6 p. m. Cars leave Indianapolis at 8:55 a. m. and 3:55 p. m., arriving in Dayton at 12:55 and 7:55 p. m. In addition to these through limited cars, the car leaving Dayton at 7 p. m. will connect at Richmond with an Indianapolis car, making the distance in the same time and arriving at Indianapolis at 11 p. m.

Report of Low-Fare Project for Milwaukee Denied.—The report that Mayor Johnson of Cleveland, George K. Kobusch of the St. Louis Car Company, and Joseph Hein of Kansas City are interested in a project to build a low-fare street railway system in Milwaukee, which was published in the Review last week, has been denied by the persons interested. Mayor Becker, of Milwaukee, who has been carrying on a campaign against the public service corporations in that city, in denying any knowledge of such a project, makes the following statement: "Any one, or any company, wishing to come to Milwaukee to build and operate a street car line, I do not care who or where they come from, can come here as far as I am concerned, providing they have the proper financial backing and support; and I will welcome any or all of them, particularly any one who will give Milwaukee a three-cent fare service."

Conductor Convicted for Transfer Fraud.—The discovery of an attempt to defraud the Brooklyn Rapid Transit Company of a portion of its daily cash fares has resulted in the arrest and conviction of one conductor, with a six-months sentence in the penitentiary, and evidence which it is claimed implicates three other conductors and an outside confederate. The plan followed was that of exchanging transfer tickets and passing them in place of cash fares received. The scheme was made practicable, it is alleged, by the aid of a 12-year-old boy who carried the tickets back and forth between the conductors, who were in the deal, and who received as his portion of the proceeds one cent for each transfer carried. It is claimed that each conductor could make \$2.00 or more a day by this method. An employe of the company who had been invited to join the combination reported the incident and led to the discovery of the practice.

Chicago "Public Comfort" Ordinance Declared Void.—Judge George A. Carpenter, of the circuit court, on January 5 declared void the Chicago ordinance prohibiting the overcrowding of street cars. The city had brought a large number of suits against the street railway companies under this ordinance, but was restrained from continuing prosecution about a year ago by Judge Mack. The Illinois supreme court recently dissolved the injunction and ordered a rehearing of the cases. The companies filed demurrers and it was in sustaining these demurrers that the court declared the ordinance void, on the ground that it does not define with certainty the offense it condemns. The ordinance provides that passengers must be carried comfortably and without overcrowding. The court held that there is no exact definition of the words "comfort" and "overcrowding," and that the companies consequently could not know the exact conditions to be complied with.

Northwestern Electrical Association.—Secretary B. C. Adams, Lincoln, Neb., has announced the programme of the annual meeting, which will be held at the Coliseum, Chicago, in connection with the electrical show on January 16, 17 and 18. The following papers are to be read: "Enthusiasm," by Geo. E. Legler; "Profitable Co-operation," J. Robert Crouse; "Premiums to Employes," Ernest Gonzenbach; "Some Characteristics of Alternating-Current Motors in which the Central Station Man is Vitaly Interested," C. W. Bergenthal; "Producer Gas Power," Professor Richter; "Outline Lighting," Homer Honeywell; "Some Phases of Smaller Central Station Management," H. H. Scott; "Uniform System of Accounting for Small Companies," Fred W. Insull; "Some Points on Illuminating Engineering for the Small Central Station," J. R. Crayath; "The Trend of Improvement in the Design and Operation of Boiler Plants," A. Bement; "Warrantable Expense for Meter Testing," O. J. Bushnell; "Premiums to Employes," Ernest Gonzenbach. This programme is subject to revision.

Does Not Want Trolley Lines.—The attitude of the Boston & Maine Railroad concerning the acquisition of electric roads was defined recently by President Tuttle in denying a report that the company was seeking control of the Massachusetts Electric Companies. He said: "Whatever may be the policy of the New Haven road, that of the Boston & Maine is strongly opposed to the wholesale absorption of trolley lines. I have found that when you provide a market for electric lines they are built almost as fast as the public highways will accommodate them. The Boston & Maine does not intend to constitute itself a market to which trolley promoters may take their securities. So far as any interest in the Massachusetts Electric Companies is concerned, the Boston & Maine has never owned, directly or indirectly, a share in the stock of this corporation, and has no disposition to obtain any interest in it whatsoever. If the New Haven road wants the Massachusetts Electric

Companies, either in whole or in part, it is welcome to buy it and such purchase will encounter no opposition from the Boston & Maine. Where the trolley can be made a feeder to the steam road the latter may here and there find it to its interest to own the electric line, but the Boston & Maine is not seeking to buy up competing or parallel roads.

Increases in Wages for Conductors and Motormen.—The beginning of the new year witnessed an increase of the wages of the conductors and motormen on electric railways in all parts of the country. Some of the companies who announced increases at that time are as follows: Indiana Columbus & Eastern Traction Company, increase of from 1 to 2 cents an hour according to length of service; Northern Ohio Traction & Light Company, increase of 10 per cent on the southern division, thus putting the men on that division on the same schedule as those on the northern division; Indianapolis Traction & Terminal Company, increase of 1 cent an hour; Ft. Wayne & Wabash Valley Traction Company city lines, increase of 1 cent an hour; Illinois Traction Company, increase of 15 cents a day to all employees receiving less than \$2.50 per day; Cedar Rapids & Iowa City Railway & Light Company, increase of 10 per cent; Topeka City Railway, increase of about 9 per cent. The Public Service Corporation of New Jersey on January 1 put into effect a new schedule for motormen and conductors of from 20 to 23 cents per hour, increasing one cent an hour for each five years of continuous service. The Concord Maynard & Hudson Street Railway announced a schedule of 20 cents an hour for the first year of service, 21 for the second, 22 for the third and fourth, 23 for the fifth and sixth, 24 for the seventh and eighth, and 25 after the eighth year.

Interurban Road Petitions for Joint Rates with Steam Road.—The Cedar Rapids & Iowa City Railway & Light Company of Cedar Rapids, Ia., has petitioned the interstate commerce commission to establish joint through rates covering the shipment of livestock and cereals between points on its lines and points on the Chicago & Northwestern Railway. The complainant sets forth that it operates an interurban electric line from Cedar Rapids through Swisher, North Liberty and Coralville to Iowa City, and is capable of handling trains of regular freight cars, and that its road is connected with the Northwestern at Cedar Rapids. No other roads pass through North Liberty and Swisher and various industries which do a large amount of shipping are located on the complainant's line and have no access to outside points except over its lines and the Northwestern. Several of these industries had asked for joint through rates but when the electric road requested the steam road for such rates the latter had refused. The commission is also asked to prescribe a division of the rate. The Cedar Rapids & Iowa City is interested in a proposed line from Iowa City to Muscatine and if it is secured the joint rates asked for the financing of the project would be greatly facilitated.

The Northwestern, in its answer to the complaint, states that the electric road is not engaged in interstate commerce nor subject to the provisions of interstate commerce laws, and that it has no facilities or equipment for the handling of freight; that it has at various times received freight for shipment from points on the electric road and that it has in every case been obliged to furnish the necessary equipment; that the complainant has never delivered or offered to deliver to it cars loaded with grain, livestock or other freight. The answer further states that the company's rates have been reasonable and just and that the volume of the business originating on the electric road is not sufficient to warrant joint through rates.

American Railway Insurance Company Organized.—Representatives of 27 leading electric railway and power companies met at Cleveland, O., on January 10 and completed the organization of the American Railway Insurance Company, the object of which, as previously mentioned at various times in the Review, is to carry the insurance of the companies at actual cost, thus avoiding the necessity of paying the high rates charged by the old-line insurance companies. The plan is that worked out principally by Mr. Henry N. Staats, of Cleveland, and was outlined in the report of the "Insurance" committee of the American Street and Interurban Railway Association at Columbus. The preliminary meeting to organize the company was held in the office of that association in New York on December 7. This company, together with three other companies to be organized, the Traction Mutual Insurance, the Electric Mutual Insurance and the Associated Railway Companies' Insurance company, is expected to carry the entire insurance of the companies subscribing to the stock. A board of directors was elected as follows: H. E. Andrews, Cleveland; G. L. Andrews, New York; A. B. Akins, Cleveland; H. L. Clark, Philadelphia; Alexander Dow, Detroit; H. A. Everett, Cleveland; G. I. Eastbrook, Philadelphia; C. G. Goodrich, Minneapolis; J. C. Hutchins, Detroit; Walter Kernan, New York; R. E. Shelton, Columbus; and J. H. Price, Samuel Seavill and H. N. Staats, Cleveland. H. E. Andrews was elected president and H. N. Staats vice-president and general manager. The companies represented were: Metropolitan Street Railway, Brooklyn Rapid Transit, Twin City Rapid Transit, Cleveland Electric Railway, Rochester Railway, Syracuse Rapid Transit, Erie & Mohawk Valley Railway, Baltimore City Railway, Rochester & Eastern Rapid Railway, Rome City Railway, Omaha Railway, Northern Ohio Traction & Light, Toledo Railway & Light, Canton-Akron Railway, Detroit United Railway, Henger Railway & Light, East St. Louis & Suburban Railway, Alton Grand St. Louis Traction, Grand Rapids Railway, St. Joseph Railway, Light Heat & Power, Columbus Railway Light, Lake Shore Electric Railway, Cleveland & Southwestern Traction, Cleveland Plainville & Eastern, Detroit Edison, Cleveland Electric, Philadelphia Interurban, Baltimore & Philadelphia. The headquarters will be in Cleveland.

Construction News

FRANCHISES.

Denver, Colo.—A franchise has been granted for an electric line from Orchard Place to Cherelyn, Petersburg, Ft. Logan, Littleton and back to Cherelyn. This will do away with the old horsecar line from Orchard Place to Cherelyn.

Glencoe, Ill.—A perpetual franchise has been granted to the Chicago & Milwaukee Electric Railway for right of way through the town, embodying the following provisions: All curves in the tracks may be straightened; there may be four tracks through the town when deemed advisable; dangerous grade crossings shall be eliminated; the company shall construct a macadam street parallel to its entire right of way through the town; 5,000 feet of railroad track shall be removed from the public street.

Kenosha, Wis.—The Chicago & Milwaukee Electric Railroad has been granted right of way over the only two remaining north and south streets of the city. The Chicago Kenosha Milwaukee & Lake Geneva line which was planning to parallel the line of the former company has been refused entrance to the city. It is stated that the Chicago & Milwaukee is planning to build a road west from Kenosha to Lake Geneva to be connected with the Milwaukee division.

Keokuk, Ia.—L. Behr & Co. has been granted a franchise for an electric line from Burlington to Keokuk, Ia.

Lawton, Okla.—A 50-year franchise has been granted to the Lawton Rapid Transit Railway for an electric line from Lawton to a summer resort to be established by the company in the Wichita mountains, the road to run by way of Fort Sill.

Mt. Pleasant, Pa.—A franchise has been granted to the Pittsburgh McKeesport & Greensburg Railway over the principal streets of the city. The company expects to extend its line from Hunker to Mt. Pleasant early in the summer.

Ogden, Utah.—The Ogden Rapid Transit Company has petitioned the city council for a 50-year extension of the present franchise, which has 15 years yet to run. The company agrees to electrify the Ogden & Northwestern Railroad and to extend the line to Utah Hot Springs within two years.

San Francisco, Cal.—The Parkside Realty Company has applied for a franchise for a street railway in lower Sunset and Lake Merced districts, to open up the district now being developed by the company. The United Railways Company is said to be behind an application for a franchise over Sixteenth street from Kansas eastward to the intersection of Seventh and South streets.

Seattle, Wash.—Franchises for a street railway have been granted to the Seattle Electric Company on Summit, Thirty-first and Nineteenth avenues, Ewing street and Wallingford avenue. Application for a franchise on Third avenue from the intersection of Third avenue south and Main street to Third and Jackson, has been referred to the corporations committee.

Wallace, Idaho.—W. J. Hall has been granted a 50-year franchise to construct and operate an electric railway line in this city.

Wilmington, N. C.—The Consolidated Railway Light & Power Company has been granted a franchise to double track much of its lines in the city and to build several extensions, including a line to Carolina Place. A. B. Skelling, manager, Wilmington, N. C.

INCORPORATIONS.

Brunswick & Middletown Electric Railway.—Incorporated in Maryland to build an electric railway from Brunswick to Middletown via Petersburg and Burkittsville. Capital stock \$80,000. Incorporators: William Schnuffer, of Brunswick; Edward C. Shaffer, O. Horsey, Levin West, Charles M. Huffer, Samuel Cloggett, Charles J. House, Joseph D. Ahalt, Millard F. Cook and A. G. Horloe.

Buffalo Construction Company.—Incorporated in West Virginia to build a street railway in Fairmont, with extensions later to Morgantown and Clarkburg. Capital stock, \$10,000. Incorporators: A. L. Pearson, C. F. Shannon, M. M. Ward, R. O. Miller and J. H. Mann.

Chicago & Southwestern Electric Railway.—Incorporated in Oklahoma to build an electric railway from Chicago, Ill., to Denver, Colo., 2,500 miles, passing through Joliet, Mendota, Rock Island, Moline, Galena, Peoria, Pekin, Streator, Bloomington and East St. Louis in Illinois; St. Louis, Jefferson City, Sedalia, Independence, Kansas City and St. Joseph in Missouri; Dayton, Muscatine, Des Moines and Council Bluffs in Iowa; Omaha, Lincoln, Topeka and Sapulpa in Nebraska; Kansas City, Lawrence, Topeka, Junction City, Minneapolis, Osborne and Stockton in Kansas; and Denver, Colorado Springs and Pueblo in Colorado. Capital stock, \$250,000,000. P. M. Dunn and Louis F. Rabe, of Chicago are the principal incorporators. Headquarters Chicago and Guthrie.

Caledonia Street Railway.—Incorporated in Pennsylvania to build a line from Gruffenburg to Gettysburg, 12 miles. Capital stock, \$120,000. M. C. Kennedy, Chambersburg, Pa., president.

Central Texas Traction Company.—Incorporated in Colorado,

(Tex.) Capital stock, \$50,000. Incorporators: J. V. Watkins, William H. Moser, W. T. Medders and E. A. Firman, all of Dallas.

Finlum & Sharon Hill Railway.—Incorporated in Pennsylvania to build a 4-mile electric railway in Delaware county. Capital stock \$25,000. W. A. Riggs, Reading, Pa., president.

Frankfort Delphi & Northern Traction Company.—Incorporated in Indiana to construct and operate interurban lines. Capital stock, \$100,000; principal office Frankfort, Ind. Incorporators, A. S. Strauss, W. M. Cohee and William H. Cohee.

Halifax Suburban Electric Company.—Organized for building an electric railway from Halifax, N. S., through Rockingham, Bedford and Sackville to Waverley. It is stated that construction will begin about April 1. Harvey E. Harding of Bradstreet & Harding, New York City, is interested in the project. Directors, George E. Boak, Hon. Wm. Chisholm and others.

Iowa Railway Light & Power Company.—Incorporated in Iowa to take over the Marshalltown Light Power & Railway Company and build the proposed Boone street loop, the fair-ground extension and a line to Milbourne and Riverview park. Capital stock \$10,000. President, Hamilton Browne, Geneva, Ill.; vice-president, S. W. C. Jones, South Orange, N. J.; secretary and treasurer, Arthur T. Browne, of Geneva, Ill.

Jefferson & Wilson Street Railway.—Incorporated in Pennsylvania to build one and a third miles of electric road in Allegheny county. Capital, \$8,000. President, Hugh Miller, Dravosburg, Pa.

Lederachville & Pennsburg Electric Railway.—Chartered in Pennsylvania to build a trolley line between Lederachville and Pennsburg. President, George Hoeger, Norristown; directors, William S. Lambert, Reading; William C. Riffert, Dauphin; Michael A. Kelley, Pittston, and John F. Lederach, Lederachville, Pa.

Lisbon Durham & Freeport Street Railway.—Articles of association for this company have been approved by the Maine railroad commissioners. The proposed line will run from Lisbon through Durham to Freeport, Me., nine miles. Cyrus W. Davis of Waterville, Me., Edwin J. Lawrence, S. A. Nye, A. B. Page and Amos F. Gerald of Fairfield, Me., are directors.

Mt. Desert Transit Company.—Articles of association have been approved by the railroad commissioners for a line 40 miles long to run from Ellsworth through Trenton, Eden, Mt. Desert and Tremont to Southwest Harbor, Me. Capital stock, \$160,000. Directors, Clement Newbold, Philadelphia; John J. Kennedy, New York; George B. Dorr, Robert Amory and Fred C. Lyman of Eden, Me.

Newcastle Union Railway.—Incorporated in Indiana to build an electric railway through Newcastle, Sulphur Springs, Middletown and Honey Creek. Capital stock, \$50,000. Incorporators: Thomas B. Millikan, Charles S. Hernly, Charles W. Mouch, Myer Heller, Harry E. Jennings and Albert D. Ogborn. Headquarters, Newcastle, Ind.

Terre Haute & Western Railroad.—Incorporated in Illinois, with a capital stock of \$100,000. Directors, Frank T. O'Hara and James Stewart, Paris, Ill.; William B. Trogdon, Vermilion, Ill.; Charles T. Mordock and John E. Lamb, Terre Haute, Ind.

Transcontinental Electric Railway.—Organized at Portland, Me., for the purpose of building electric railways anywhere in the United States. Capitalized at \$50,000,000.

Utica Southern Railroad.—Incorporated in New York to build and operate an electric road 26 miles long in Oneida and Madison counties. Capital stock, \$600,000. Directors, W. M. West, Hamilton; M. W. Terry, Waterville, and F. K. Baxter, Utica.

TRACK AND ROADWAY.

Alton Jacksonville & Peoria Railway.—It is announced that work on an extension of this company's line from Alton to Godfrey, Ill., will be started immediately. The line is now being built from Third and Belle streets in Alton to the city limits on Belle street.

Boston, Mass.—The Stone & Webster Engineering Corporation, of Boston, has filed with the Massachusetts railroad commission, detailed plans for an electric road from Boston to Providence, asking for a certificate of public necessity.

Bowling Green Railway.—This company announces that it will extend its lines about two miles on the principal streets of Bowling Green, Ky., during the present year. It is expected to abandon the present power station and rent power from the Green River Hydro-Electric Company as soon as that company completes its plant on Green River.

Chicago Lake Shore & South Bend Electric Railway.—Grading has been completed and eight miles of track laid on this company's line between South Bend and New Carlisle, Ind. The Cleveland Construction Company has the contract for grading the entire line from South Bend to Kensington, Ill. J. B. Hanna, Cleveland, O., president.

Citizens' Light & Transit Company.—Rails have arrived for this company's extension in Pine Bluff, Ark., out East Sixth avenue from Main to Ohio street, 1 mile. F. E. Cherot, manager, Pine Bluff.

Cleveland & Indianapolis Interurban Railway.—Riggs & Sherman, of Toledo, have completed surveys for this line between Ottawa and Norwalk, O., and a 40-foot right of way is now being secured between those points. Options are also being taken on an additional 10 feet for use in case it is decided to use double track. The route is practically an air line.

Eau Claire Gilmanton & La Crosse Electric Railway.—It is reported that La Crosse, Wis., capital has become interested in this project for an electric line to Eau Claire. Surveys have been made from La Crosse as far as White Hall and estimates are to be presented to the promoters in a few weeks.

Evansville & Southern Indiana Traction Company.—The declared object of this company, recently incorporated in Indiana with \$4,500,000 capital stock, is to construct, purchase and operate lines and systems of street and interurban railroads in, to, through and between the following towns and cities: Evansville, Maubstadt, Fort Branch, Princeton, Patoka, Hazleton, Decker, Purcell, Vincennes, Oaktown, Sullivan, East Mount Carmel and westward to and through Smith, Stevenson, Chandler, Deforest, Booneville, Edgewater, Oakland City, Petersburg, Washington, Bloomfield and Bloomington. The company also proposes to engage in supplying electricity for light, heat and power to the cities and people along the entire line. The Evansville Princeton & Vincennes Interurban Railway, which is in operation from Evansville to Princeton, and under construction from Princeton to Vincennes, has already been acquired. James Murdock, Lafayette, president.

Fairmont & Clarksburg Traction Company.—This road between Fairmont and Clarksburg has recently been opened for operation. A. J. Purinton, general manager, Clarksburg, W. Va.

Ft. Wayne & Springfield Railway.—The first car over this new line from Ft. Wayne to Decatur, Ind., was operated on January 2, but after the first seven miles was pushed by a steam locomotive, as the overhead was not entirely completed. It was expected that regular service would be started this week. W. H. Fledderjohann, president and general manager, Decatur, Ind.

Goff's Falls Litchfield & Hudson Electric Railway.—This company, controlled by the Manchester (N. H.) Traction Light & Power Company, has recently completed a line from Manchester to Nashua, N. H., via Goff's Falls and Litchfield, which is the last gap in the connection between Boston, Mass., and Concord, N. H.

Illinois Traction Company.—A party of the officers and directors of the Illinois Traction System, including some of the Montreal capitalists interested in the company, last week made a tour of inspection of the entire property, for the purpose of considering several contemplated extensions to be made this year, as well as to review the work of the past year. It was announced that a line will probably be built from Eureka to Peoria via Washington, that the line from Springfield to Lincoln will be extended either to Mackinaw or to Bloomington, if sufficient interest is taken by the property owners along the line; that the line from Bloomington to Champaign will probably be built, and that there is a possibility of extending north from Bloomington to Joliet at some future time, acquiring the line now under construction from Pontiac north. Ralph Modjeska, consulting engineer, of New York, has been engaged to make an investigation and report on the feasibility of constructing a bridge across the Mississippi river at Venice, to carry the company's cars to Nort St. Louis. It was stated that if the engineer's report on the bridge is favorable, if satisfactory franchises can be secured in St. Louis, and if the necessary charter can be secured from the government the project will be realized. Regular service was opened on January 6 between Bloomington and Danvers, the first section of the Bloomington-Peoria line.

Indianapolis & Louisville Traction Company.—J. E. Greeley, of Jeffersonville, Ind., superintendent of construction, announces that cars will be running between Sellersburg and Scottsburg, Ind., by April 1.

Iowa & Missouri Traction & Power Company.—This company will let contracts at an early date for constructing its line from Fairfield, Ia., to Memphis, Mo., 52 miles. J. W. Andrews, Keosauqua, Ia., is chief engineer.

Kalamazoo Lake Shore & Chicago Traction Company.—S. J. Dunkley, president, Kalamazoo, Mich., is reported as saying that financial arrangements have been made for completing this line from Kalamazoo to South Haven, Mich. The section from Kalamazoo to Paw Paw is already in operation.

Kansas City St. Joseph & Excelsior Springs Electric Railway.—Work has been started on the bridge across the Missouri river at Kansas City for the line from Kansas City to St. Joseph, Mo. The bridge is to cost about \$1,190,000. The contract for the four piers has been let to the Kansas City Construction Company; the contract for the steel work is still to be let. The entire line to St. Joseph is to be double track. Entrance to Kansas City will be made over the tracks of the Metropolitan Street Railway. Ira Hedrick, consulting engineer, Kansas City.

Lexington & Interurban Railways.—Grading has been completed for a line from Lexington to Frankfort, Ky., 30 miles, and it is expected that the road will be in operation during the coming summer. The right of way for a line to Winchester, 16 miles, has been secured, and it is expected that construction will begin during the year. The company also has plans under consideration for extensions to Richmond and Nicholasville, located to the southeast and southwest, respectively, of Lexington.

Macon Americus & Albany Electric Railway.—Surveys are being made on this line between Macon and Albany, Ga., and as soon as they are completed the work of building the road will be started. W. Jordan Masseur is president of the Interurban Construction Company, Macon, Ga., which has the engineering work in charge.

Mankato Electric Traction Company.—This company will soon be organized and incorporated under the laws of New Jersey with \$175,000 capital stock to build 6 or 7 miles of road within the city limits of Mankato and North Mankato, Minn., and possibly a line

to Kasota and St. Peter. The Minkato Commercial club is securing subscriptions to the stock.

Mansfield, O.—The Roberts & Abbott Company, of Cleveland, is making surveys for an electric railway from Mansfield to Mt. Vernon and Columbus, O.

Michigan United Railways.—General Superintendent J. M. Bramlette, of Lansing, Mich., has announced that extensive improvements are to be made on the Lansing city lines this spring, including some double tracking and special work.

Monmouth County Electric Railway.—This company, which connects Red Bank and Long Branch, N. J., has completed an extension from Red Bank to Fair Haven and cars were operated over the line on January 2. W. F. Hoggan, of New York, president.

Mt. Vernon, Ind.—G. F. Martin, of Albion, Ill., is interested in a project to build an electric railway from Mt. Vernon, Ill., to Mt. Vernon, Ind., and it is stated that surveys are being made.

New Orleans Railway & Light Company.—It is stated that many improvements on this company's line at West End will be made as soon as a new ordinance drawn on the same lines as that in force last year and now being considered by the council, has been passed.

New York & Pennsylvania Railroad.—It is reported that estimates are being secured for changing this road, which extends from Shingle House, Pa., to Canisteo, N. Y., from a steam to an electric line. G. W. Pierce, Canisteo, N. Y., is chief engineer.

Northern Ohio Traction & Light Company.—The Cleveland Construction Company has announced that it will begin work in the spring on the extension from Wadsworth to Seville, O. Only two miles of track remains to be laid on the line between Barberton and Wadsworth and it is expected that it will be in operation in a few weeks. Charles Currie, general manager, Akron, O.

Northwestern Elevated Railroad.—Rapid progress is being made on the Ravenswood extension of this elevated road in Chicago. The new branch extends 4 1-3 miles in a northwesterly direction from Clark street, a little above Belmont avenue, to Kimball avenue, north of Irving Park. Rails have been laid as far as the Irving Park boulevard station and ties are laid as far as the Berteau street station. The first foundations were laid in November, 1905. E. C. Noe, general superintendent, Chicago.

Northern Texas Traction Company.—This company now has improvement work under way on its city lines in Ft. Worth, Tex., aggregating about 5 miles. H. M. Flanders, chief engineer, Handley, Tex.

Oregon Electric Railway.—This company, backed by Moffatt & White, of New York, is building a line from Portland to Salem, Ore., with numerous feeders. W. S. Barstow & Co., of Portland and New York, is the contractor. The main line is 49 1/2 miles long and is estimated to cost about \$2,000,000. A bridge 800 feet long, with 2,300 feet of trestle approaches, is now under construction at Wilsonville, Ore., over the Willamette river. The road is completed from Salem to Lake Labish, 8 miles, and cars are being operated from Salem to Chemawa. Construction is to begin at the Portland end during the present month. There are now 4,000 tons of rails on the ground and 2,000 tons more have been ordered.

Peoria Railway.—This company has decided on an extensive programme of improvements for the next few months. New equipment is to be ordered and electric switches will be installed at important points. A loop will be built at Glen Oak Park. S. L. Nelson, manager, Peoria, Ill.

Point Loma Electric Railway.—Organized at San Diego, Cal., to build an electric railway from San Diego to Ocean Beach and Rosville, Cal. Capital stock, \$250,000. Incorporation papers will soon be applied for. Directors: D. C. Collier, G. M. Hawley, S. F. Smith, G. D. Easton and C. O. Reinbold.

Red Bank, O.—Captain Peter Richards, of this city, is contemplating the construction of a double-track line from Red Bank, through the Duck Creek Valley, to Winton Place, 8 miles. Estimated cost, \$500,000.

Shelburne Falls & Colerain Street Railway.—It is reported that Wilmington, Vt., lumber interests have secured options on a majority of the stock of this company, which connects Shelburne Falls and Colerain, Mass., and that if the purchase is made they will extend it over a bridge across the Deerfield river to Buckland, Vt. C. G. Murey, of Colerain, president.

Somerset (Ky.) Railway & Light Company.—This company has recently completed a new street railway system in Somerset, and cars were operated for the first time on January 1.

Southern Michigan Railway.—It is reported that this company which connects South Bend, Ind., and St. Joseph, Mich., is planning to extend its lines from St. Joseph to South Haven and eventually to Grand Rapids, Mich. J. McAl Smith, general manager, South Bend.

Spokane & Inland Empire Railroad.—President Jay P. Graves has applied to the city council of Spokane, Wash., for a franchise for a tunnel nearly a mile long to connect the freight and passenger terminals of the company in that city. The franchise would provide for a double-track tunnel from the passenger station at Main avenue to Front avenue under Lincoln street, thence under Front to Center street between Bernard and Brown, thence diagonally from Front avenue to the freight grounds of the company, and on Front between Division and Franklin streets with the right to carry power transmission lines and to use either electricity or steam as motive power. The tun-

nel is not to exceed 60 feet in width and the crown of the roof is to be not less than four feet below the surface. The purpose of the tunnel is to save time for trains in the city and to avoid dangerous crossings, and it will be used as an entrance to the terminals of the various interurban lines of the company including the Spokane & Inland Railway, the Coeur d'Alene & Spokane Railway and a line which is to be built down the Spokane river to Nine Mile bridge. It is also expected that this tunnel will be used by an electric railway which is to be built into the Big Bend country. The required property has been purchased. The cost of construction is estimated at about \$800,000 not including the improvements at the terminal stations, which would cost \$100,000 more, and it is estimated that the subway can be built in two years.

Steubenville & Ohio Valley Traction Company.—This company has recently begun operating from Steubenville to Mingo, O., over the county roads. The running time between the two points is 15 minutes.

Suburban Transit Company.—It is reported that right of way has been secured for this company's lines from Columbia to Colonial Heights, S. C., 1 1/2 miles. Contracts are to be let within 60 days. Julius H. Walker, Columbia, S. C., is president.

Toledo & Chicago Interurban Railway.—This company has begun condemnation proceedings to secure right of way for the extension from Waterloo to Butler, Ind. The road is now in operation from Ft. Wayne to Butler, Ind. F. B. Perkins, general manager, Kendallville, Ind.

United Cities Traction Company.—This company, recently incorporated to build a street railway in Ft. Smith, Ark., has begun work. The Ft. Smith Construction Company is doing the grading. Ira L. Reeves, of Ft. Smith, is interested.

United Railways (Portland, Ore.)—It is reported that rails have been ordered for the city lines in Portland, for which franchises are held by C. E. Loss, and it is stated that work is to be started in a short time. The company has passed through several financial difficulties but Mr. Loss has deposited a bond to secure the franchises and states that the project will be carried out. A line from Portland to Forest Grove is contemplated.

United Traction Company.—Edgar S. Fassett, general manager of this line and its new subsidiary company, the Hudson Valley Railway, together with several other officials of these companies, has just returned from a trip of inspection over the lines and announces that plans for substantial improvements on the Hudson Valley are being made. These will include the placing of orders for new equipment and the eventual double-tracking of its entire length. Twenty-five news cars have been ordered by the United Traction Company, one of which embodying many new features, has arrived and will shortly be given a trial trip.

Western Massachusetts Street Railway.—It is reported that this company will build an extension from Chester to Lee, Mass., this summer, to connect at the latter point with the Berkshire Street Railway. H. C. Page, general manager, Springfield, Mass.

POWER HOUSES AND SUBSTATIONS.

Boston Elevated Railway.—The annual report of this company, which has just been issued, says that the company has made arrangements to increase its power supply by the construction of two gas-engine plants, supplying 1,675 kilowatts; by the installation of a turbine generator rated at 2,000 kilowatts, and by the purchase of about 3,000 kilowatts, making a total of upward of 7,275 kilowatts, which is an increase of about 20 per cent.

Camden Interstate Railway Company (Huntington, W. Va.)—This company is soon to build a new power house at Ironton, O., to furnish power for the Ohio division of that railway. The machinery formerly used in its Ashland, Ky., power house will be utilized as far as practicable in the new structure. The Ashland power house has been laying idle since the company's new plant at Kenova, W. Va., was completed more than a year ago.

Cumberland & Westernport Electric Railway.—It is reported that this company will install a new 600-h. p. engine and boiler in its power house at Clarysville, Ind.

Green River Hydro-Electric Company.—This company, organized some time ago with a capital stock of \$200,000, will begin the construction of a concrete-steel power plant at Glenmora, Ky., on the Green river early in the spring. The specifications call for three 50-inch vertical turbines which are to be connected to alternators of 250 kw. capacity. It has not yet been decided what make of machines are to be used. In addition to the main power station an auxiliary steam station will be built to care for the load during the flood period. The current is to be carried to Bowling Green, a distance of 12 miles, and to other towns by a 12,000-volt transmission line, and will be utilized for railway lighting and general power purposes. The men behind the project are Mr. H. D. Fitch of Bowling Green, Ky., and Mr. T. L. Fitch and Marshall Ballott of Louisville. Mr. H. Von Schom, of Detroit, is consulting engineer.

Omaha & Council Bluffs Street Railway.—A contract has been closed with the General Electric Company for a 2,000-kw. alternating current turbo generator to be delivered in six months.

Utah Light & Railway Company.—The officials are looking about for a building site of about 12 blocks, where it is intended to centralize the car barn, power house and repair shops of the entire Salt Lake City system.

Personal Mention

Mr. E. E. Winters has resigned as assistant to the president of the Chicago & Milwaukee Electric Railroad.

Mr. Frank S. Drake has resigned as superintendent of maintenance of way of the Portland (Ore.) Railway & Light Company.

Mr. W. H. Horton has been appointed assistant superintendent of the Rutland (Vt.) Railway Light & Power Company, succeeding Mr. Nathan S. Eldredge, resigned.

Charles L. Furbay, general superintendent of the Augusta Railway & Electric Company, Augusta, Ga., has resigned after five years' service with the company.

Mr. J. A. Barry, of Buffalo, N. Y., has been elected president of the Jamestown Chautauqua & Lake Erie Railroad succeeding Mr. F. L. Chase, of Jamestown, N. Y., resigned.

Mr. Fred D. Potvin, of Grand Rapids, Mich., has been appointed manager of the Citizens' Railway & Light Company, of Muscatine, Ia., succeeding Mr. A. L. Lindner, resigned.

George S. Rice, chief engineer New York Rapid Transit Commission, who has charge of engineering work on the tunnels being built under the East river from the Battery to Brooklyn, the headings in one tube of which met recently was born on February 23, 1849, at Boston, Mass.

He was educated at Harvard University, class of 1870, graduating with the degree of S. B. A. Mr. Rice has had a long and varied engineering experience. The year before his graduation he was employed in the engineering department of the Boston water works and assisted in the construction of the Chestnut Hill reservoir. Upon leaving the university he became assistant engineer of water works at Lowell, Mass., and in 1871 division engineer of the Boston water works. This position he held until 1877. He was then made principal assistant engineer in charge of the Boston main drainage works, which position he held for three years. In 1880 he engaged in mining

George S. Rice.

work in Arizona and Colorado and after seven years' experience in mining engineering went to New York City as deputy chief engineer of the Aqueduct Commission which had charge of the New Groton aqueduct. He worked vigorously for four years in revising the methods of construction which had been adopted for this work, and in 1891 resigned to become chief engineer of the Rapid Transit Commission of Boston. From 1892 to 1900 he engaged in engineering in private practice, serving from 1893 to 1900 as instructor of water supply and sanitary engineering at Harvard University. In 1900 he was appointed deputy chief engineer of the Rapid Transit Commission of New York, and in 1905, at the resignation of William Barclay Parsons, was made chief engineer of that commission. Mr. Rice is a member of the American Society of Civil Engineers, the Boston Society of Civil Engineers, the New England Water Works Association and the American Institute of Mining Engineers and of various clubs in New York City and Boston.

Mr. M. J. Kehoe, who has been for several years chief engineer of power plants of the Ft. Wayne & Wabash Valley Traction Company, has had his title changed to superintendent of power.

Mr. F. B. Royster, formerly master mechanic of the Virginia Passenger & Power Company, of Richmond, Va., has been appointed superintendent of the Montgomery (Ala.) Traction Company.

Mr. H. C. Page, general manager of the Springfield Street Railway, of Springfield, Mass., has had his jurisdiction extended over the Woronoco Street Railway and the Western Massachusetts Street Railway.

Mr. Clarence Keever has been appointed local superintendent of the Indiana Union Traction Company at Muncie, Ind., succeeding Mr. William Emmons, resigned to take service with a new road in Kansas.

Mr. H. G. Fitzpatrick has been appointed superintendent of the city lines of the Cincinnati Dayton & Toledo Traction Company at Hamilton, O. Mr. Fitzpatrick was formerly chief operator for the company at Trenton.

Mr. William A. House, second vice-president and general manager of the United Railways & Electric Company, of Baltimore, Md., has been appointed acting president, succeeding the late General John M. Hood. Mr. House has been connected with the company for 26 years, having started as a conductor. Mr.

William Early, General Hood's private secretary, has been elected assistant secretary.

Mr. M. W. Surratt has been appointed superintendent of the local lines of the Indiana Union Traction Company at Tipton, Ind.

Mr. W. P. Read, for the past 17 years superintendent of railway service for the Utah Light & Railway Company, Salt Lake City, Utah, has resigned. The duties of the office have been assumed by Mr. F. L. Morse, general superintendent, and Mr. O. P. Arnold, Jr., assistant superintendent.

Mr. G. J. A. Paul, general superintendent of the Youngstown-Sharon Railway & Light Company, has been appointed general superintendent of the lines of the Mahoning & Shenango Valley Traction Company, which include the Youngstown-Sharon. Mr. Paul will retain his headquarters at Youngstown, O.

Mr. Winthrop B. Nye, general superintendent of the Ray system of electric railways in Rhode Island and Massachusetts, which has been acquired by the New York New Haven & Hartford Railroad, has resigned and will act as private secretary to M. Joseph G. Ray, former general manager of the Ray system.

Mr. L. S. Storrs has been appointed vice-president of the Consolidated Railway & Light Company with headquarters at Boston. Mr. Storrs was formerly geologist of the Northern Pacific Railway and later expert and engineer of tests of the New York New Haven & Hartford, which position he has held until his recent appointment.

Mr. Edgar S. Fassett, general manager of the United Traction Company, Albany, N. Y., has been appointed manager of the Hudson Valley Railway, Glens Falls, N. Y., control of which has been secured by the Delaware & Hudson Company interests. The Hudson Valley has been practically merged with the United Traction.

Mr. Albert H. Stanley, general superintendent of the northern and central New Jersey divisions of the Public Service Corporation of New Jersey, has been given entire charge of the street railway department for the state, including South Jersey. Mr. Stanley was formerly general superintendent of the Detroit United Railway system.

Mr. George A. Iler, formerly connected with the Western Maryland Railroad as electrical engineer and superintendent of motive power and machinery for all its mines, has resigned to become electrical engineer and superintendent of the Las Vegas (N. M.) Railway & Power Company with headquarters at Las Vegas. Mr. Iler was formerly chief electrician in the United States Navy.

Obituary.

J. W. W. Bryant, division superintendent of the Nashville Railway & Light Company and ex-member of the county court, died on December 27, at his home in West Nashville of spinal meningitis, aged 38 years. Mr. Bryant had been identified with the street railway company for 14 years and had risen from the position of motorman and conductor to that of division superintendent of the lines in North and West Nashville.

James Smith, who, until seven years ago, was superintendent of all track work carried on by the Toronto Railway Company, died at his residence in Toronto on December 18. Mr. Smith was 31 years of age, and had been engaged in railway work all his life. In 1869, when the Toronto Street Railway was purchased by Kiely Brothers, Mr. Smith was placed in charge of the mechanical department of the system. When the present company was formed he was promoted to the position of superintendent of construction, from which he retired seven years ago.

Railroad Commissions Ask Jurisdiction Over Interurbans.

The Washington railroad commission in its report to the governor recommends that the section of the present law which exempts interurban lines from the operation of the act be repealed, inasmuch as it creates a doubt as to the validity of the law, and also because electric lines are coming more and more into competition with the steam roads. The commission says: "A doubt exists in the minds of some as to the constitutionality of the provision of the law conferring the power on the railroad commission to fix reasonable rates to take the place of rates found by the commission to be unreasonable, by virtue of the exemption of interurban lines from the operation of the act, as found in Section 22 thereof. Since the passage of the commission act two years ago, interurban lines have assumed an importance in the transportation of freight in direct competition with the steam railroads in eastern Washington, and many important lines and extensions are projected in western Washington. While these competing lines are probably under the jurisdiction of the commission and subject to its control, no uncertainty should exist upon a subject assuming such importance as this. The commission feel that the law should be amended so as to include electric interurban lines and thus settle and remove any existing doubt. The exemption found in Section 22 should be eliminated."—The report of the Indiana railroad commission to be issued soon will recommend to the legislature that interurban lines of the state be put under the jurisdiction of the commission on the same basis as steam railroads. The constitutionality of the act creating the commission has been questioned by the steam roads, on the claim of class legislation, because the interurban electric systems were left out in the construction of the bill. The report also will recommend the prohibition of all passes on railroads in the state, steam and electric.

Financial News

Alabama City Gadsden & Attalla Street Railway.—This company has filed a mortgage for \$300,000 to the Trust Company of America, of New York, for the purpose of making improvements and extensions, including a new lighting plant. John D. Gaboury, general manager, Gadsden, Ala.

Arbutus Park Street Railway.—Owing to the mayor's veto of the ordinance recently passed by the council on account of its provision for a perpetual free franchise, this company has announced that it will offer for sale by public advertisement its charter and rights of way over all private property free from any charges, to any person or persons who will guarantee to build the line within a reasonable time. In the event of failure to receive a favorable proposal within 30 days announcement is made that its charter will be surrendered to the state and the project abandoned.

Berlin & Waterloo Street Railway.—The town of Berlin, Ont., is negotiating for the purchase of this company, which operates about 6 miles of road in Berlin and vicinity, the franchise for which expired in September. A board of arbitration has valued the property at \$75,000.

Boston & Northern Street Railway.—The Massachusetts railroad commission has authorized this company to issue \$300,000 additional capital stock.

Boston Elevated Railway.—The annual report for the year ended on June 30, 1906, has just been made public. The statement of earnings and expenses for the year, as compared with the two previous years is as follows:

	1906	1905	1904
Gross	\$13,527,185	\$12,689,676	\$12,391,353
Expenses	9,306,950	8,617,653	8,631,553
Net.....	\$4,220,235	\$4,072,023	\$3,759,800
Other Income.....	107,426	51,893	45,240
Total Income.....	\$4,327,661	\$4,123,916	\$3,805,040
Charges.....	3,475,882	3,288,831	2,975,268
Surplus.....	\$851,779	\$835,085	\$829,772
Dividend 6 per cent.....	798,000	798,000	798,000
Surplus.....	\$53,779	\$37,085	\$31,772

The company controls 414.4 miles of surface track, an increase of 9.4 miles for the year, and owns 16 miles of elevated road, making a total of 457.4 miles of track. For the fiscal year 1906, the company carried 262,267,240 passengers; in 1905 the total was 246,941,776, while in 1904 it was 241,681,945.

Forty-five "easy access" elevated cars, and 150 "easy access" semi-convertible surface cars, seating 52 persons each, have been bought. There was spent \$757,354 in renewals and repairs of surface tracks, exceeding the amount spent the previous year by \$114,504, and the year before that by \$283,683.

Buffalo & Lake Erie Traction Company.—The governor of Pennsylvania has approved the merger of this company and the Lake Erie Traction Company, under the name of the former, with \$6,750,000 capital stock.

Canyon City Florence & Royal Gorge Electric Interurban Railway.—Former Governor Peabody, of Colorado, has been appointed receiver for this company, at the application of C. C. Durkee, a creditor. The road was projected by F. S. Granger, of Florence, Colo., to connect Florence with surrounding towns, with a line to the top of the Royal Gorge. A controlling interest in the company was recently purchased by F. G. Heath, of Florence, and the receivership is on account of complications arising from this purchase.

Chicago Union Traction Company.—The annual meetings of the stockholders of the three underlying companies, the North Chicago Street Railroad, the West Chicago Street Railroad and the Chicago West Division Street Railway, were held on January 8 and the directors were all re-elected.

Dallas Consolidated Electric Street Railway.—The officers of the street railways in Dallas will apply to the legislature for a local law permitting the consolidation of the Dallas Consolidated Electric Street Railway, the Rapid Transit Railway and the Metropolitan Street Railway, which was recently authorized by the city council. The Dallas Consolidated Company will acquire the property, rights and franchises of the other two and according to the terms of the city ordinance no increase of stock or bonds is allowed except for improvements and extensions. The proceeds of such increase shall be expended in good faith for such purpose within 24 months from the date of issue.

Geneva Waterloo Seneca Falls & Cayuga Lake Traction Company.—The New York railroad commission has consented to the issuance of a first mortgage for \$1,000,000, and to the increase of the company's capital stock from \$450,000 to \$1,000,000.

Lake Shore Electric Railway.—This company expects to sell \$500,000 of three-year 6 per cent gold notes secured by general mortgage bonds now in the treasury of the company. The proceeds are to be used in liquidation of the balance of last year's improvements and the improvements of this year. The Lake Shore has done a great deal of improving during the past year, including the double-tracking of the line from Rocky river to Lorain, and the practical doubling of its power plants. During the past year a new plant of 2,000 kw. has been completed at Beach Park, and

the same sized addition will be added to the plant at Fremont, the additional power at Fremont being largely necessary to operate the Sandusky Fremont & Southern, which is now being built at a rapid rate.

Kalamazoo Gull Lake & Northern Railway.—This company, which proposes to build from Kalamazoo to Grand Rapids, Mich., via Richland and Gull Lake, has organized by electing the following officers: President, J. T. Upjohn, of Kalamazoo; treasurer, Martin P. Huyk, of Chicago; secretary and vice-president, Edward D. Hosmer, of Chicago. It is stated that financial arrangements have been made and several franchises have been secured.

Mahoning & Shenango Railway & Light Company.—It is reported that this company has acquired all the outstanding stock of the Youngstown Park & Falls Street Railway, as a part of its merger of the street railway property in Youngstown, Niles, Warren, Newcastle, O., and Sharon, Pa. E. N. Sanderson, president, New York.

Mansfield Railway Light & Power Company.—Rudolph Kleybolte & Co., of Cincinnati, has transferred its controlling interest in this company to Thomas Latham, and associates, of Cleveland, O. The consideration is not announced.

Old Colony Street Railway.—The Massachusetts railroad commission has authorized this company to issue additional stock to the amount of \$200,000.

Rapid Transit Railway (Dallas, Tex.)—The stockholders met recently and authorized the proposed merging of the property with the Dallas Consolidated Electric Street Railway and the Metropolitan Street Railway. The directors were re-elected. President C. F. Freeman, vice-president C. E. Bird, and treasurer B. E. Van Vliet were re-elected. W. W. Loomis was elected secretary in place of S. E. Williams.

Rock Island Southern.—This company, incorporated in 1905 to build a railroad equipped with steam and electric power, connecting the cities of Rock Island, Moline, Davenport, Menmouth and Galesburg, Ill., is offering \$400,000 of first mortgage 5 per cent gold bonds at 98 and interest. The line is completed from Monmouth to Galesburg and will be completed to Rock Island and in operation during 1907. The trust deed provides that additional bonds may be issued only for 60 per cent of the cost of the property during construction and 25 per cent more when the net earnings from operation equal 1½ times the interest charges on the bonds issued.

Springfield, O.—It is reported that a New York syndicate is negotiating for the merger of the Springfield Troy & Plqua Railway, the Springfield & Xenia Railway, the Washington Traction Company, the Home Light Heat & Power Company, and the People's Light Heat & Power Company.

Stark Electric Railroad.—At a recent meeting at the general offices of the company at Alliance, O., the following officers were elected: President, C. R. Morley; vice-president, D. Morison; secretary, E. S. Cook; treasurer, E. Weibenson. In addition to the above the directors are William Grief, R. H. Brown and Frank Straus. All the officers are from Cleveland.

The City Railway (Dayton, O.)—This company has announced an issue of 1,000 shares of additional common stock at par, to be allotted to present stockholders pro rata of their holdings. The company has also announced a special dividend of 5 per cent.

Toledo Railways & Light Company.—The annual meeting of the stockholders will be held in Toledo on January 17. At this meeting the matter of leasing the street railroads owned and controlled by the Toledo Ottawa Beach & Northern Railway Company will be voted upon. The Toledo Ottawa Beach & Northern Railway Company is a consolidation of the Toledo & Point Place Railway and the Toledo & Ottawa Beach Railway. The stock of these companies will be transferred to the Toledo Railways & Light Company, and that company will also guarantee the bonds of the Toledo Ottawa Beach & Northern.

United Railroads of San Francisco.—Conclusive evidence of the general resumption of business in San Francisco, more particularly that of the street railway traffic, is furnished in the latest report on the receipts and earnings of the United Railways Investment Company, the holding company of the United Railroads of San Francisco, which operates the four leading surface traction lines in that city. This report, which was made public by Ernst Thalman, of Ladenburg, Thalman & Company, president of the holding company, shows that the gross passenger receipts for December amounted to \$556,000, despite the numerous delays and losses occasioned by the fire and labor troubles. The gross receipts for the entire year were \$5,941,000, a decrease of about \$1,116,000 compared with the gross receipts of 1905. "The officers and directors of the United Railroads of San Francisco," said Mr. Thalman, "are confident that the rebuilding of San Francisco will go forward with continued vigor. They report that the labor situation is steadily improving, and that the company now has no difficulty in obtaining all the labor necessary for the reconstruction of its old cable lines. Several of these lines have been completed and the entire work of reconstruction will be finished by spring. The delivery of the 250 new cars begins this week and, when they are placed in service, the United Railroads should be a well equipped as any street railroad property in America. This new construction has been of the highest order, the weight of the rails used in the new tracks varying from 109 to 141 pounds. The officials of the company report a most favorable outlook for the year's business. It is confidently believed the earnings for 1907 will exceed those of 1905."

Manufactures and Supplies

ROLLING STOCK.

Peoria Railway Company, Peoria, Ill., is in the market for 15 new cars.

Chicago Milwaukee & St. Paul Railway is in the market for ten motor cars.

Chicago City Railway Company will soon be in the market for 300 cars for city use.

United Railways Company of St. Louis, Mo., is building a sample car at its own shops.

Brooklyn Heights Railroad Company, Brooklyn, N. Y., is preparing specifications for 100 cars for surface use.

Michigan United Railways, Lansing, Mich., is reported in the market for a considerable amount of rolling stock.

Laconia Street Railway, Laconia, N. H., ordered in 1906 one closed double truck car from the Laconia Car Company.

Hartford & Springfield Street Railway, Hartford, Conn., placed orders during 1906 for four 15-bench open double truck cars for city service.

Louisville Railway Company, Louisville, Ky., has contracted with the St. Louis Car Company for 50 cars for delivery in the spring of 1907.

Lewiston Brunswick & Bath Street Railway, Lewiston, Me., ordered during 1906 one 35-foot double truck interurban car from the Laconia Car Company.

New York Auburn & Lansing Railway, New York, N. Y., has ordered through A. H. Flint, 15 Broad street, New York, ten cars from the Jewett Car Company.

Atlantic Shore Line Railway, Kennebunkport, Me., ordered in 1906 four 36-foot box trailers and three 30-foot electric locomotives from the Laconia Car Company.

Willamette Valley Traction Company, Portland, Ore., has ordered through W. S. Barstow, 56 Pine street, New York, eight cars from the Jewett Car Company.

Chicago Union Traction Company's receivers have been granted authority by Judge Peter S. Grosscup of the United States Circuit Court of the seventh district to purchase 149 cars.

Kansas City St. Joseph & Excelsior Springs Electric Railway, Kansas City, Mo., is considering bids for new equipment including passenger, express and parlor cars. Ira G. Hedrick, consulting engineer, Kansas City, Mo.

International Railway Company, Buffalo, N. Y., has just placed an order for 75 new cars with the J. G. Brill Company for September delivery. The cars will be 46 feet in length with a seating capacity of 44 persons, will have end ventilators and be equipped with air brakes. This company is also reported in the market for a number of cars for interurban service.

Spokane-Pend d'Oreille Rapid Transit Company, Limited, Spokane, Wash., advises that it will adopt first-class passenger equipment as follows: six motor cars with closed motorman's cab, 10-foot baggage compartment, 12-foot smoking compartment and passenger compartment to seat 72 persons, length over all being 60 feet, width 8 feet 3 inches and fitted with Walkover rattan seats. Ten trailers without compartments, of the same dimensions as the motor cars, upholstered in plush; two express motor cars similar to those furnished by the J. G. Brill Company for the Washington Water Power Company of Spokane, Wash., to have a length over all of 39 feet 4 inches, height from top of rail to trolley base, 11 feet 11 inches, arched roof and hood covered with canvas and enclosed vestibule for motormen. The company advises that it will also order 20 box and 40 flat cars of standard freight construction and air brakes.

SHOPS AND BUILDINGS.

Birmingham Railway Light & Power Company.—This company is considering plans for an addition to its present car barns to cost \$75,000, consisting of a new shed similar to the present one, covering half the block bounded by Third and Fourth avenues and Tenth and Eleventh streets, Birmingham, Ala. W. A. McWhorter, master mechanic.

Halifax Electric Tramway Company.—This company is building a new car barn on Lower Water street, Halifax, N. S., which will be 100 by 135 feet, of brick, with concrete floor and folding steel doors. It is expected to be ready for occupancy by December 31.

International Railway (Buffalo, N. Y.).—Work has been completed on the new Cold Springs shops and car house at Buffalo, at a cost of about \$350,000. The old car house has been remodeled and converted to a truck and carpenter shop. The completion of the new building, which is 560 by 620 feet, gives the company accommodations for 200 cars. T. W. Wilson, general manager.

Shreveport (La.) Traction Company.—This company has closed a contract for the erection of a new car shed and shop building, to

cost about \$23,000. The building will be of brick, steel and reinforced concrete, 120 by 160 feet in area.

TRADE NOTES.

Kobbe Company, designer of technical advertising, making a specialty of "follow-up" business-getting systems and publisher of *Compressed Air*, has removed its office from 90 West Broadway to 108 Fulton street, New York.

George F. Hichborn assumed the duties of general traffic manager of the United States Rubber Company, 42 Broadway, New York, effective January 1, 1907, filling the vacancy created by the resignation of J. N. Galloway.

Dean Electric Company, Elyria, O., is having plans prepared by the Osborn Engineering Company for a \$100,000 addition to its plant. Work will be commenced in the spring and considerable new machinery including a 500-horsepower engine, boilers and generators will be purchased.

Standard Coupler Company, 160 Broadway, New York, has appointed George A. Post, Jr., engineer representative of the company. Mr. Post, Jr., graduated from the Cornell University in 1905 with the degree of M. E., and was formerly a sales engineer with the Westinghouse Machine Company.

Gideon N. Caleb, vice-president of the Bettendorf Axle Company, has been confined to his apartments for the past eight weeks. Bronchial asthma developed into pleurisy and this into pneumonia and his condition has been critical. The crisis, however, has passed, and it is believed he will soon be able to get around again.

R. W. Marshall & Co., 95 Liberty street, New York City, dealer in electric railway material, both new and second hand, reports the following sales: 4 interurban cars, 55 feet long fully equipped, 1 freight car and 2 combination baggage and passenger cars to the Meyersdale & Salisbury Street Railway, Pittsburg, Pa. Also 4 single-truck cars fully equipped to the Pittsburg & West Moreland Railway, Irwin, Pa.

Railway Commercial Training School, 117 Main street, Elmira, N. Y., is now under the general management of E. E. Tingley. W. G. Moore, previously manager, is now assistant secretary of the General Engine Company, 640 Ellicott square, Buffalo, N. Y. The Railway Commercial Training School provides training for young men in railroad work, offering courses in telegraphy, freight traffic, passenger traffic, baggage and express work.

J. H. Wagenhorst & Company, of Youngstown, Ohio, reports among its sales of electric blue printing machines the following: Oklahoma City Railway Company, Oklahoma; Ohio State University, Columbus, O.; G. D. Peters & Co., Moorgate works, London, Eng.; Griffin Wheel Company, Chicago, Ill.; Alvey-Ferguson Company, Louisville, Ky.; New England Structural Company, Boston, Mass.; Eugene Dietzgen Company, Chicago, Ill.; American Steam Pump Company, Battle Creek, Mich.

Lidgerwood Manufacturing Company New York, has appointed Francis F. Coleman publicity manager of that company. Mr. Coleman was formerly connected with the Westinghouse and Allis-Chalmers companies and recently with the Taylor Engineering Company. He was at one time editor of the *Electrical Age* and during the Louisiana Purchase Exposition at St. Louis had charge of three large exhibits there, being the organizer and first vice-president of the Machinery Club, and was active in bringing about the organization of the United Exhibitors' Association at the fair. Mr. Coleman is a member of the Technical Publicity Association.

A. O. Backert, for a number of years in charge of the Pittsburg office of the *Iron Trade Review*, and for the past two years associate editor of the *Iron Age*, with headquarters at Chicago, has accepted the position as editor of *Foundry* and associate editor of the *Iron Trade Review*, effective January 17. T. J. Wright has been appointed successor to Mr. Backert as western editor of the *Iron Age*, with headquarters at Chicago. Mr. Wright was formerly connected as salesman with Joseph T. Ryerson & Son, Chicago, and with the Western Iron & Steel Company, of St. Louis, and later with the Hartford Steam Boiler Inspection & Insurance Company as special agent, during which time he contributed several articles on steam boiler practice to the technical press.

Peter Smith Heater Company, Detroit, Mich., manufacturer of the "Smith" type of hot-water heater, announces that arrangements have been made with the Electric Service Supplies Company of Philadelphia and Chicago to sell its products during the coming year. This change has been made due to the increasing business and in anticipation of a still greater increase the company will erect a two-story addition 100 by 120 feet. This will be equipped with all the modern devices necessary for increasing the plant to about four times its present capacity. The "Smith" heaters are used on more than 175 different railway companies in the country. Among these is the Public Service Corporation of New Jersey, which has installed 100 of the new magazine type of heater.

William J. Clark, of New York, has been appointed by Governor Charles E. Hughes as a delegate from that state to the national convention for the extension of foreign commerce of the United States, which will be held at Washington, D. C., beginning Monday, January 14, 1907. Mr. Clark is general manager of the foreign department of the General Electric Company. He has been interested in and studied for many years the conditions of foreign commerce and there are few men in the United States who under-

stand the commercial conditions better. His book, "Commercial Cuba," is recognized as an authority on the subject. He has been a delegate to many important commercial conventions and in 1895 was a member of the United States delegation at the International Railway Congress held at Washington, D. C.

New York Switch & Crossing Company, Hoboken, N. J. has purchased a rail bender, cold saw, planer for crossing work and other machinery for use in its manufacturing plant. The company reports a very good business. It manufactures a full line of frogs, switches, crossings, automatic electric switches and is making a specialty of hard-steel centers. The anti-straddling tongue switch is a special patent of the company and is meeting with great success.

ADVERTISING LITERATURE.

H. B. Underwood & Co., Philadelphia, Pa.—A neat blotting pad has been issued to call attention to the portable railway repair shop tools which this company makes, a novel idea being introduced by the use of portraits suggestive of the different ways of soliciting orders.

Royal Ventilator & Manufacturing Company, Philadelphia.—The "Royal" system of ventilation is described and illustrated in a booklet, issued by this company, which contains sizes and prices; also, illustrations of the application of the ventilator to various situations—in factories, engines and boiler rooms, train sheds, barns, etc.

McConway & Torley Company, Pittsburg, Pa.—A 152-page catalogue substantially bound and handsomely illustrated has been issued by this company. It contains illustrations and lists of parts of the various forms of coupler equipments manufactured by it for passenger cars, freight cars and locomotives. The changes in railway principals and service requirements have demanded changes in coupler equipments, and the catalogue shows a number of new ideas and improvements in this direction. Developments in automatic coupler appliances as well as earlier combinations are shown.

Union Switch and Signal Company, Pittsburg, Pa.—"Westinghouse Automatic Electro-Pneumatic Block Signals on the Electrified Division of the West Jersey & Seashore Railroad" is the subject of Bulletin No. 28. The matter contained therein is reprinted from the Railroad Gazette for October 5, 1906. Bulletin No. 26 deals with the electro interlocking system of the Union Switch and Signal Company. Some 26 pages are devoted to description and there are numerous color plates and folders. The electric interlocking system of the company has been under development some three years and since 1904 has been in railroad service.

Babcock & Wilcox Company, New York, has purchased from the Stirling Consolidated Boiler Company, of Barborton, O., its American property and interests including all accounts and bills receivable and has assumed its obligations. The purchased plant will be operated in the future by the Babcock & Wilcox Company under the name and style of the Babcock & Wilcox Company (Stirling Department) and will be operated under the management of the same gentlemen who have operated the Stirling Consolidated Boiler Company, the sales department of this company being associated with the Babcock & Wilcox Company in similar capacities. The Babcock & Wilcox Company (Stirling Department) will manufacture the Stirling Altman & Taylor and Cahill water tube boilers and appliances heretofore manufactured by the Stirling Consolidated Boiler Company.

Ingersoll-Rand Company, 11 Broadway, New York City.—"Ingersoll-Sergeant Air and Gas Compressors," a publication of 184 pages, covers the complete line of compressors built by the Ingersoll-Rand company. A brief description of each of the nine classes is given followed by tables of sizes and illustrations of typical machines and representative plants. A large number of illustrations covering almost every line of industrial activity is a particular feature of the publication. Two articles are also presented, one being entitled "Some Important Elements of Economy in the Straight Line and Duplex Types of Compound Air Compressors" and the other entitled "Compound Air Compression" which enters exhaustively into the details of the subject. The Ingersoll-Rand company states that it has made every effort to make the publication not only a catalogue of their compressors, but a text book of useful information to engineers. Leaflet 45-A is designed to call attention to Ingersoll-Rand rock drills of which the company states that it has built over 90,000.

Roberts & Abbott Company, Schofield Building, Cleveland, O.—This company has just issued a second edition of its booklet relative to electric railways. It has 83 pages and cover and is illustrated of the matter in this edition is new. The company is composed of E. P. Roberts and W. H. Abbott, well known electrical and mechanical engineers, who have been retained as consultants by the construction of more than 300 plants for electric lighting, heating, power transmission, water works, etc. The booklet is intended to answer the question "What are the duties of a construction and supervising engineer for electric railways?"—that proposed railroad, second edition properties." It has a large number of maps and helpful illustrations and the result of 20 electric railways will be said to be a partial list of these with which the company has been connected. The booklet is made that a road can be built in 90 per cent of the estimate made by the engineer and that a road can be built at a cost less than the estimate. The company has the necessary experience in contracting in advance to a forecast of roads about to be built.

THE NATIONAL BOILER TUBE CLEANER.

The National steel tube cleaner, illustrated in the accompanying engraving, is a device for cleaning boiler tubes, which is manufactured by the H. W. Johns-Manville Company, of New York.

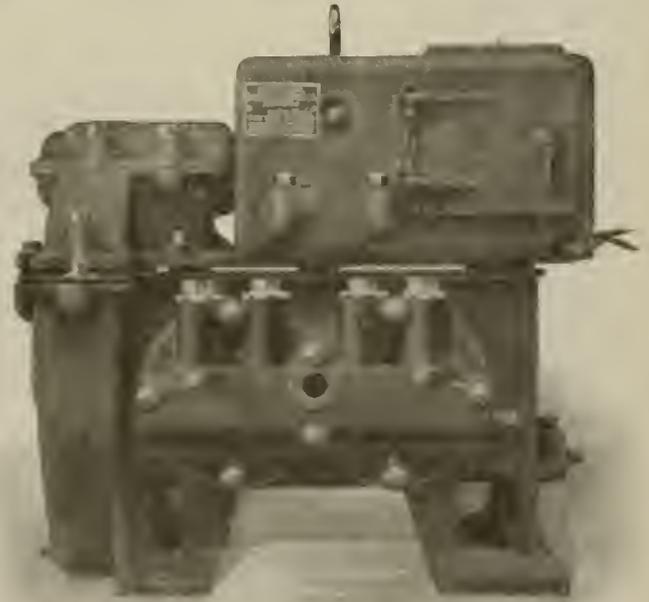

The National Steel Tube Cleaner.

The salient feature of the National steel tube cleaner is that each blade acts independently of the others and is so spring-like in nature that it conforms very snugly to the surface which is to be cleaned. It can be forced through the tube with very little effort and each plate removes the particles of sediment or scale within the pipe. Another advantage of this cleaner is that it can be adjusted to fit various sizes of pipe, and if one or more of its blades become broken by rough usage or wear, they can be readily repaired at nominal expense.

The manufacturer states that it is meeting with great success in the sale of this device.

THE NEW NATIONAL MOTOR COMPRESSORS.

In very recent months the National Brake & Electric Company, of Milwaukee, has developed and is now manufacturing in large numbers its new types of motor compressors, of which the most frequently used for street railway service are the A-4 and BB-2 types. These motor compressors represent many advanced ideas in design and construction, and are modelled according to the suggestion of some of the foremost master mechanics and street

(27)

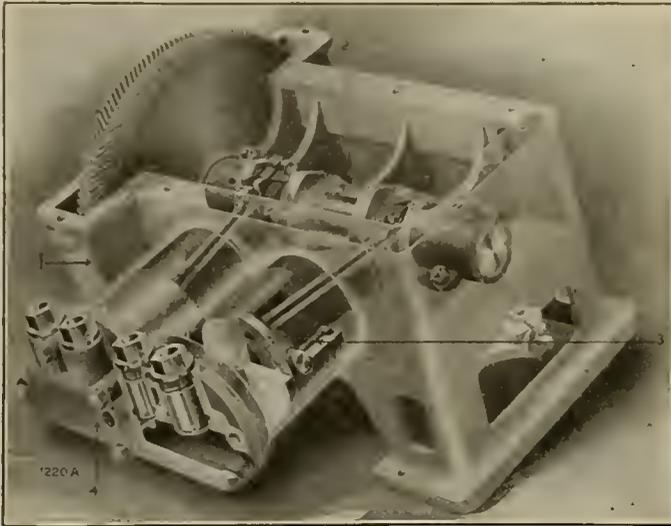

National Motor Compressor—Figure 1.

railway officials, as well as embodying the most progressive and practicable features which the long experience of the airbrake experts of the company had dictated.

One of their many distinctive features is the construction of motor and compressor as entirely separate and self-contained units. When the two parts are assembled a very compact and rigid compressor unit is produced. In Figure 1 is shown a complete A-4 type compressor. The crank chamber cover and motor base are separated by a 1/2-inch air space, which is clearly shown in the illustration. In addition to acting as a separator of the heat radiated by the compressor the motion of the air causes a strong current of air to circulate through the space, thus rapidly sweeping away the heated air. This feature greatly conduces to low temperature operation while the separate cover gives the required bracing and stiffening for the crank chamber casting.

Since the enclosure of a motor compressor in a box will by surrounding it with warm air and preventing the escape of currents generated by a car in motion from reducing the temperature, lower the efficiency of operation many per cent in

cases where the car is running the greater part of the day, the new National motor-compressors are enclosed and made absolutely dust and water proof. Thus the operating parts are constantly exposed to the atmosphere, eliminating the dear price of about 25 per cent reduction in efficiency in a box-enclosed type

National Motor Compressor—Figure 2.

compressor which for the sake of cleanliness may be gained in a few minutes with a jet of water with the enclosed type.

The simplicity of design and construction of the compressor is splendidly shown in the phantom view, Figure 2. Referring to this figure, the crank shaft is fitted with a third bearing (2) in its center, which in addition to supporting and strengthening

The valves are of the solid cold-drawn tubular steel type and are interchangeable. They are seated by gravity aided by air pressure, no spring or auxiliary device being required. The discharge pipe runs straight out of the valve head to the main reservoir, thus disposing with the necessity of attaching unsightly elbows and goose necks. Both gear and pinion are a standard herringbone pattern and are cut with the greatest accuracy on gear cutting machines.

The motor of the compressor outfit is a standard 4-pole entirely enclosed type, designed with an unusually liberal rating and with a view to complete accessibility. One of the many distinctive features of the motor is the heavy insulation employed in the brush gear. The brush gear on compressors is often a weak part, due to the fact that only about $\frac{3}{4}$ to $\frac{1}{2}$ inch external leakage surface in insulation is provided and the accumulation of oil and dust frequently results in complete breakdowns by the current eating through the bushing or creeping over the small oil-covered surface. The thickness of the insulation used on National motor compressor brush gear is $1\frac{1}{4}$ inches, which gives assurance that no such contingencies will occur.

ROLLING STOCK FOR LANCASTER, PA.

The Conestoga Traction Company, of Lancaster, Pa., operates two types of closed cars, the one shown in the illustration, which is one of a number of new cars built by the J. G. Brill Company; the other, the Brill grooveless-post semi-convertible type. The first named type has been adopted for general use in the city and additional orders are pending. Last year nine cars of the latter type were purchased and additional orders for this type also will soon be placed. Forty-seven miles of new track have recently been laid, making the aggregate length of the lines 147 miles; this added mileage will make the Conestoga Traction Company rank as one of the largest trolley companies in Pennsylvania outside of the few largest cities.

The new cars do not differ materially from standard Brill cars of the closed type; the upper sash are stationary; the lower sash drops in the ordinary manner. The chief dimensions are: Length over end panels, 20 feet 8 inches, and over vestibules, 30 feet 1 inch; width over sills including sheathing, 7 feet 4 inches, and over posts at belt, 8 feet 2 inches. The car bodies are mounted on the Brill No. 21-E single truck with a wheelbase of 7 feet.

The interiors have a finish of cherry; ceilings are of birch. The builders furnished their own make of specialties throughout

Closed Car for Conestoga Traction Company.

it at the weakest point, eliminates all tendency of the shaft to fracture at the center. This third bearing also makes the operation of the compressor much quieter and gives greater freedom from vibration than is the case with two bearing compressors. Thus the life of the pump and gearing and their efficiency is greatly increased.

Removal of crank shaft and gear is accomplished by lifting them straight out of the crank chamber. The removal of the gear from the shaft, which must be done on most compressors before the crank shaft can be dismantled is entirely unnecessary; thus greater accessibility to the pump is gained and the minimum time consumed in dismantling and reassembling the parts. The splash system of oiling is used the gear and crank running constantly in a bath of oil which is splashed over all the operating parts of the compressor. It will be noticed that the gear case (1) is constructed as an integral part of the crank case instead of being cast separately. Such construction makes a highly rigid pump base, reduces the number of loose parts and unsightly bolts and does not necessitate draining the oil from the gear case and crank chamber for inspection of these parts.

The valve head is constructed with discharge valves towards the center and the suction valves towards the outside of the head.

the cars, such as: "Dumpit" sand boxes, angle-iron bumpers, radial drawers, and spring cane seats.

To Build Interurban Station at Toledo.

The Interurban Station Company, of Toledo, has been incorporated at Columbus by John C. Reid, Joseph S. Young, William R. Hodge, William H. McClellan and William F. Nutt. The initial capital of the company is \$10,000. The object is to build and control the proposed interurban union passenger station on the ground bounded by Superior, Huron, Beach and Jackson streets. The project has been held up many months by the board of public service, which refused to give the necessary permit to construct furnouts on Superior street. This question is now in the hands of council committee on railways and telegraph, and as the granting of the permit is being urged by the chamber of commerce and by many prominent business men, it is believed that in a short time council will act accordingly. If this controversy is settled in the near future, it is probable the new station, costing over \$200,000, will be built before the close of the year.

The growing use of the electric and cable car in the carriage of mails is indicated by a few figures given in the annual report of the postmaster general for the year ended on June 30 last. The number of electric and cable car routes in operation on June 30, 1906, was 460, with a total length of 6,014.74 miles, and an annual travel of 11,114,183.98 miles, costing \$572,495.89. This is an increase of 20 routes, of 369 miles in length, of 572,496.55 miles of travel, and of \$29,540.51 in annual cost. The report does not state how much of this business was handled by cable cars, but as there are now very few cable roads in existence the significance of the figures is not affected greatly. Although the increasing importance of electric railways as an indispensable factor in the transportation world has long been recognized, this particular branch of their usefulness has attracted little notice. And while they have been rapidly extending their fields of endeavor, both in competition with and as supplementary to the steam railroads, by taking up the handling of express and freight, little has been said of their value as carriers of mail. This is a field for which the electric railway is especially fitted, both in large cities and between small communities which are without the advantages of a frequent steam railway service, and there is little doubt that the large increase in this department for the past year will be followed by a still larger one in the next year.

Electric Railway Mail Service. That the rate of compensation for electric and cable car mail service has been increased during the past year should make the business more attractive to the companies. The last report of the postmaster general asked congress for authority to increase the rates applicable to electric and cable car service from 3 cents per mile traveled for closed-pouch service to not exceeding 4 cents per mile traveled in cases where exceptional conditions as to weight of mail and number of offices existed, and from three-fourths of a cent per linear foot per mile traveled for

apartment and full car service to not exceeding 1 cent per linear foot per mile traveled in exceptional cases. Congress authorized this increase, with the proviso that on routes over 20 miles in length, outside of cities, the rates shall not exceed those paid for steam railroad service. Under this legislation, effective on July 1, 1906, compensation has been restated, on certain routes where the conditions referred to have prevailed, at the rate allowable for railroad service. In a number of the larger cities service has been restated at the rate of 1 cent per lineal foot. A few of the electric and cable car companies are still demanding higher rates for service than are deemed necessary by the postoffice department, but the efforts to secure service under the amended law have been reasonably satisfactory, and the postmaster general recommends no further legislation at this time.

Starting with Portable Substations. The Illinois Traction System, which has under active construction several connecting lines of 40 or more miles in length has found that portable rotary converter substations are quite useful at the time of first opening new lines. This company has five such substations, each consisting of a substantially-built box car carrying one 300-kilowatt rotary converter together with transformers and switching apparatus. When a new line is to be opened, one of these substations is set off on a temporary side-track and a short pole, with standard high-tension cross-arms and insulators, is erected close to the end of the car. In this way the three-phase transmission wires may be brought to the high-tension disconnecting switches in the car. The substations are also useful in assisting permanent rotary converter equipments at the time of concentrated loads. One of the reasons why the Illinois Traction System finds portable substations to be of value is that it contemplates using single-phase current for operating all that part of its system north of Springfield and Decatur, but at the present time, while some 80 miles of this track are ready for the single-phase operation, the single-phase car equip-

Rates for Handling U. S. Mail. That the rate of compensation for electric and cable car mail service has been increased during the past year should make the business more attractive to the companies. The last report of the postmaster general asked congress for authority to increase the rates applicable to electric and cable car service from 3 cents per mile traveled for closed-pouch service to not exceeding 4 cents per mile traveled in cases where exceptional conditions as to weight of mail and number of offices existed, and from three-fourths of a cent per linear foot per mile traveled for

ments are not yet at hand. Thus with portable substations available it is possible to locate them so that they may feed direct current to the catenary construction and the usual type of direct-current interurban car equipments be used until the delivery of the single-phase transforming and motor equipment.

A HOLDING COMPANY IN CLEVELAND.

The decision of the United States supreme court to the effect that the franchises of the Cleveland Electric Railway Company on Quincy street and Central avenue expired in 1905, although leaving that company with valid franchises for all the rest of its great system, seems to have brought about a condition in which its shareholders are willing to consider the "holding company" plan long advocated by Mayor Johnson. For this reason it is worth while to consider that plan, not from the point of view of the owners of the street railway property, but from that of the municipality and the users of the street railways whose control would be transferred.

Mayor Johnson's plan for Cleveland is in every substantial element the same as that which he advocated in Detroit in 1899 when, as a street railway owner, he was seeking to sell the lines in that city to its people. It is, in short, that a leasing corporation of public-spirited citizens be formed to take over the street railway property and operate it for the benefit of the community without hope of or effort for private pecuniary gain beyond the standard rate of interest upon an agreed valuation. Of course this interest must be paid to the real owners of the property and, therefore, the men charged with the operation of the leased street railways can have no pecuniary reward beyond the moderate salaries which they can properly vote to themselves. Under such circumstances it is obvious that there can be no desire to invest money in securities of the leasing corporation and that its capital resources, compared with the obligations for rentals, renewals and repairs which it must assume under any lease which at all adequately protects the owners of the property, must necessarily be insignificant. In fact such a corporate group could not qualify as lessors, especially when they make a drastic and wholly experimental reduction in rates the chief part of their programme, and no owners of street railway property would deal with them on that basis. Therefore, Mayor Johnson, first in Detroit and now in Cleveland, was obliged to devise some way by which a city which has no legal right to own or operate street railways or to go into the street railway business as a partner with any corporation or in any other way, could come to the support of the lessors and equip them with a fraction of its own credit and responsibility. The device adopted is that of a so-called "security franchise." It is unquestionably adroit but questionably legal. That, however, is another story, and one that Cleveland and Ohio will take care of in due course.

By a "security franchise" Mayor Johnson means one nominally issued to the owning company but so restricted that it shall not go into effect or become operative unless and until the holding corporation defaults in some of its obligations under the lease. In order to satisfy the most reluctant shareholder, who might otherwise block his enterprise, Mayor Johnson has particularly specified that the privileges under this "security franchise" shall be broader and more liberal than the city would directly grant to any corporation. In other words and adapting the statement to the concrete conditions of the Cleveland situation, the city of Cleveland is asked, by its mayor, to bet a more liberal franchise than its citizens would approve as a separate proposition, against nothing whatever, that a group of estimable gentlemen with little experience in the street railway business and no direct financial interest in the success or failure of their undertaking can and will successfully and profitably operate the great

local system upon lower rates of fare than the owners of that system believe to be possible. And it is to be observed that this "holding company" plan cannot go into effect until the present owners have testified to their conviction that three-cent fares cannot be made profitable, in the strongest possible manner, by parting with the control of their property in preference to undertaking that task. If their judgment is not radically wrong it is plain that the security franchise must soon fall into their hands and thus prove the folly of not dealing with them directly and at once.

Assuming, however, that the holding company plan will continue for a number of years it is certainly questionable whether it can be regarded as a good one for the city of Cleveland. A growing city demands a growing street railway system. The holding company, having no capital of its own, or practically none, cannot build new lines and extensions; at three-cent fares it certainly will not be able to build them out of earnings. Having nothing to pledge it can not borrow capital. There remains the question whether private capital will, under such conditions, come to the rescue. With the spectacle of one company practically expropriated in favor of the mayor's holding company it is plain that private capital will not rush into this void. If it comes at all it will undoubtedly demand a new "security franchise" and thus neither horn of the dilemma affords much comfort to the citizens. The same conditions which control extensions are certain to control and to prevent proper improvements. Cleveland's street car service is even now hampered by the fact that proper rapid transit facilities, commensurate with the size and rapid growth of the city, do not exist in its business center. Nothing but such a perennial controversy as has been in progress throughout the whole of Mayor Johnson's administration could have prevented the normal development which would have given the city a complete system of subway transit of modern character long before this. Such a system is, in the judgment of experts on municipal transportation, much more needed than lower fares, but it will be long deferred if the "holding company" plan is adopted.

It is not necessary to go into the question of the quality of service likely to be rendered under the proposed conditions. The peculiar combination of inexperienced operating officers, extraordinarily low fares, a system inadequate to the city's needs, pressing demands to meet the conditions of a lease requiring regular payments of rent and recurrent expenditures for repairs and renewals, with probable political interference at nearly every step, is, of itself, sufficiently suggestive in that direction.

Of the many remaining objections to Mayor Johnson's plan the political one is easiest comprehended. This is perhaps enhanced by the peculiar conditions prevailing in Cleveland where the very mayor who has produced the unparalleled street railway situation has already announced his candidacy for the governorship of Ohio and is a recognized aspirant for the presidency of the United States. Such a candidate for high political honors, whose peculiar methods are illustrated by a recent convention to which he sent a majority of delegates who were on the payroll of the city which he controls, is not likely to overlook the advantages to be gained by complete domination of the political action of the two thousand voters in the employ of the local street railway system. That there can be a holding company which he does not completely dominate no one in Cleveland for a moment believes.

Will the holding company plan be accepted by the people of Cleveland? It will be remembered that when Mayor Johnson tried to get the same plan accepted in Detroit the popular sentiment against it was so strong that it compelled a city council which had voted in his favor to rescind its action within three weeks. And in Detroit both the power of Governor Pingree and the influence of the street railway company were united in favor of the "holding company" plan.

Perhaps the latent opposition to such a plan as that advocated by Mayor Johnson has in Cleveland remained dormant on account of the public opposition to the plan on the part of the street railway company. It is not impossible that, if it had been less reluctant to submit to expropriation, the public would have been less blind to the evils inherent in the plan proposed or would have been more conscious of the need of acting in its own protection. If it should now appear that the corporation has been won over to the "holding company" plan that fact may be the signal for an awakening of public sentiment that will put an end to the scheme at the very moment when it appears about to realize victory.

RIGHT OF WAY AT INTERSECTING POINTS.

Intersection points on important routes are always danger spots in the operation of cars and the prevention of collisions at crossings and junctions is one of the constant anxieties of a division superintendent. Failure of brakes, over-speeding, slippery rails, bad weather and other causes are often contributory to major or minor collisions, but uncertainty as to the right of way is, perhaps, the most important of all operating defects bearing upon the danger of such accidents.

Operating rules frequently require that cars shall come to a full stop before crossing another line at grade, and a red band painted upon the traditional white post in such cases announces to the motorman his arrival within the danger zone. It seldom makes any serious difference to the public upon which side of an intersection a car stops, provided printed notices of the stopping points of inward and outward bound travel are conspicuously displayed. The full-stop rule is doubtless a step in the right direction, though it delays traffic somewhat in instances where the tracks can be seen in all directions for several hundred feet on each side of the intersection.

There must be no uncertainty about the right of way, whether the cars stop before the intersection or pass over it at greatly reduced speed. The exact right of way to be given depends upon the practice of the operating company; but in general, United States mail cars should take precedence over all other rolling stock, and traffic bound inward toward the business district should be regarded superior to outward travel. A foreign car operating upon a local system as part of a through interurban route should be given a clear headway whenever possible, for there is nothing more annoying to the through passenger than to finish the last quarter of his journey by traveling at a snail's pace behind some low-powered, obstructive car of the local lines; in fact, it is a question if a through car should be obliged to stop and pick up local passengers near the end of the run if it has a clear track ahead and is closely followed by a regular car of the terminal city system.

The approach of the cars at a junction point beyond which both take a common route must result in an arbitrary settling of the right of way. In general, the most direct route should be the favored one, but in certain cases arbitrary hard-and-fast rules will have to be laid down for the particular intersection point. The main issue is that the rules must be sufficiently inclusive to cover all the cases on the system, leaving no uncertainty to the judgment of the motorman. On steam roads interlocking switches and signals solve the problem of right of way at intersection points, but on surface electric lines tightly drawn and strictly enforced regulation seem to be the most feasible way of avoiding trouble. The subject is an important one for such collisions occur every few weeks on one system or another and the resulting damage suits are decidedly worth avoiding.

THE NEW YORK STATE ASSOCIATION MEETING.

It is seldom that a technical publication has the opportunity to furnish a report of the proceedings of so satisfactory a meeting as that which occupies so large a portion of the present issue. The quarterly conference, as the president named it, of the Street Railway Association of the State of New York was distinctly a satisfactory and instructive one.

The order of the day was business from the start and the president, almost in the same breath in which he announced the meeting open, also announced the first subject under discussion. From this point the discussion proceeded without a break through two extended sessions. The general subject for consideration at the meeting was "Track and Roadway," and a part of the successful result reached by the discussion was due to the logical arrangement under which the general subject was subdivided, and to the care with which each of the several papers had been prepared. As a whole the proceedings form rather complete specifications for the construction of electric railway roadway and track, especially in paved streets, and in addition some valuable information was given as to line construction.

Under the first subhead, "Track Construction in Paved Streets," three papers were presented. The first related more especially to the track foundation, the second to ties and rail supports and the third to methods of connection between ties and between ties and rails. In this connection it was especially interesting to note the conspicuous part which concrete is beginning to play in the construction of street railway foundations. Though the subject was discussed by a number of members, there was but one dissenting voice to the proposition that the best foundation for track in paved streets is a layer of from ten to twelve inches of concrete under the base of the rail, in which the ties, whether of steel or wood, were fully embedded. Decided preference seemed to be given to the use of steel ties; in fact the authors of two of the papers defined the best track construction for paved streets to be steel ties embedded in concrete and with from four to six inches of concrete under the ties and filling the spaces between the ties up to the level of the base of the rail. The discussion of this subject was sufficiently full and general to make the results of decided value to the electric railway engineer under the varying conditions met in different sections.

It is worthy of note that the advantages of a well-tied track, in distinction from one in which the rails are separately braced, was well brought out, and this feature apparently constitutes one of the reasons on account of which the steel tie is meeting with so much favor.

Probably the most generally interesting feature of the proceedings was the paper on "Standard Rail Sections for Paved Streets," taken in connection with the discussion which it called forth. The author of this paper had made great efforts to bring out the practices and opinions prevailing in a great many places and the unanimity with which the T-rail is favored in comparison with the girder rail for paved streets seems to indicate a change of sentiment on the part of the municipal authorities, which has taken place within the past few years. The author of the paper was perhaps all the more earnest and successful in his search for data of this character for the reason that he was confronted with the alternative of putting in a construction which he was convinced would be unsatisfactory or proving to the satisfaction of the municipal authorities that practice and opinion in many other cities were upon his side of the issue. The only objection that was brought out to the use of the T-rail was with reference to a few large cities and in restricted localities in smaller cities, where there was a large amount of heavy loading traffic. In the course of the discussion the

objection apparently narrowed itself down to a question of proper paving in connection with whatever rail was used, the objection to the T-rail being that the paving stone was liable to be irregularly worn next the gauge-line of the rail, making necessary frequent repairs to the pavement. The principal arguments in favor of the T-rail were well summarized in the report referred to, and may be briefly mentioned as follows: That with the T-rail the load is taken over the center; that with proper paving there is unlimited flange-way; the section permits of the use of a long angle bar, requiring less repair at joints; the rails are less noisy and stay where they are put; they are more substantial in every way and the cost is less, an equality of cost being established between a 90-pound T-rail and a 70-pound girder.

The discussion upon rail joints established the fact that there were advocates of various methods of welding and of the mechanical joint. A new form of joint, which is a combination of the mechanical and welded, was described, which seemed likely to meet with considerable favor. One paper described in detail the process of thermit welding and another gave an interesting tabulation of costs of electric welding. Some minor objections were stated with reference to each of these two methods of forming a joint. A new form of joint described as in recent use in Cleveland, is a combination of an angle-bar connection, forming the joint mechanically, and a welded section upon the base of the rail to form the electrical connection. The description of the operation of forming this joint and a statement of the items of cost were listened to with interested attention and various expressions of approval were given.

A discussion upon "Derailing Devices" gave emphasis to a thought which was brought out in connection with the preceding quarterly meeting of this same association, namely, the desirability of close co-operation between the railway association and the Board of Railroad Commissioners of the state. At the preceding meeting two questions which were debated by the New York State association were taken up at the request of the railroad commissioners. The matter of derailing devices was considered at this meeting at the request of the same authority and while the discussion did not go far toward the establishment of any new practice or determination of the efficiency of previous practice, yet one new plan of derailing switch and method of operation was brought forward for consideration.

Under the head of "Rail Bonds," a brief discussion took place as to the relative merits of the various types of bond upon the market, but this seemed to resolve itself into a matter of personal preference, and little data of determinative value was produced.

The only part of the programme relating to other parts of railway plant than that of roadway and track was comprised under the general head of "Overhead Lines." One member who was expected to produce a paper on "Center-Pole Construction," explained his delinquency from the fact that in going thoughtfully into the subject he had been unable to find any arguments in favor of that type of construction, but much in favor of span construction. His chief objections to center-pole construction were in the matter of supporting the trolley wire with a bracket arm, which made one point of the trolley wire fixed in comparison with the flexibility of the rest of the wire. This was said to be a frequent cause of the-jumping of the trolley wheel. The use of center-pole requires a greater distance from center to center of tracks, causing an added expense in ballasting and maintenance. While span construction costs more per mile than center-pole work, it was argued that taking into consideration grading and ballasting, the balance would be in favor of span construction.

The growing use of the catenary form of construction gives great interest to the paper upon this subject, in which a large number of forms of suspension were described in de-

tail. While this method of suspending the trolley wire has been considered especially adapted to the center-pole construction, there appears to be no reason why it cannot be used equally well with span construction; in fact the author of the paper pointed out that the only feature to which it would be necessary to give attention was the fact that owing to the additional weight of the messenger wire to be carried it was advisable to allow a little more dip between the point of support on the cross suspension and the connection between the messenger wire, than in the ordinary form of cross suspension. This construction is in use, and it is authoritatively stated that the results are entirely satisfactory.

As before stated, the two sessions were devoted entirely to the discussion of the subjects mentioned. One of the advantages of a small association was thus indirectly called to mind. The small association is able to perform its functions with less machinery than seems essential to the operation of a much larger body. The Street Railway Association of the State of New York is an excellent example of the amount of work that may be accomplished in a single day, if no time is lost in getting about it.

THE RELIABILITY OF TROLLEY SERVICE.

No better demonstration of the reliability of electric railway service is needed than that given during the past few weeks by the lines in the vicinity of Boston as contrasted with the service of the competitive steam railroads in the same territory. It has for some time been apparent that the schedules of both local and through trains entering the great terminal stations of Boston have become far too uncertain for the satisfaction of the general traveling public. Delays ranging from only a few minutes in the case of local trains with short runs, to several hours in the case of many through expresses have become so frequent that the Massachusetts railroad commission has issued an order requiring all delays above 10 minutes in the case of through trains to be reported for subsequent explanation throughout a period of 30 days.

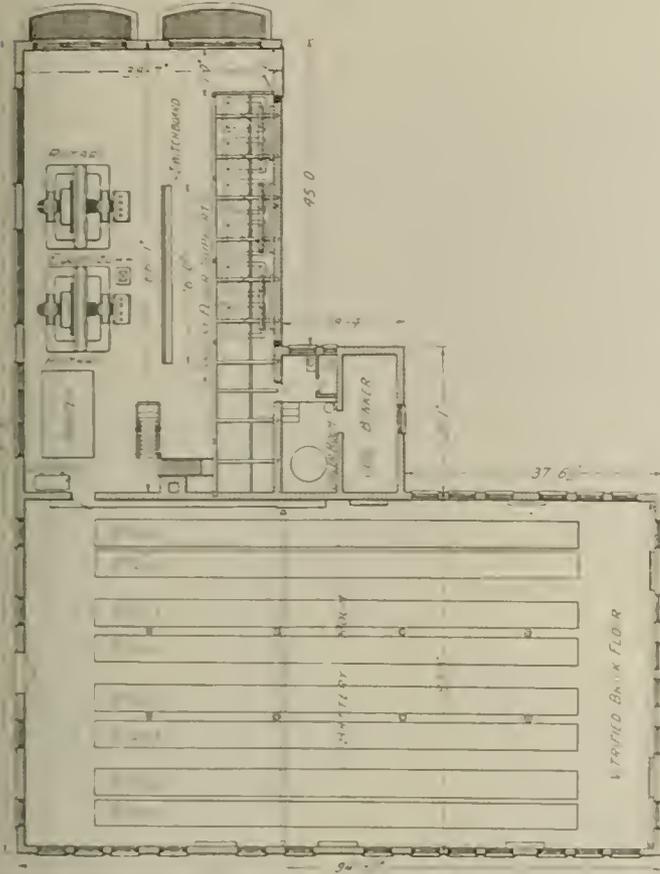

Whatever may be the causes of these lapses from schedule, carrying with them as they do enormous waste of productive time, it is most gratifying to the electric railway operator that few complaints of the lack of punctuality of trolley lines in the territory have been voiced by the public. Suburban residents boarding outward-bound cars have been sure of getting home at the usual hour, and inward-bound passengers have not been obliged to figure from 50 to 150 per cent extra running time in making business engagements. On some lines there have been annoying equipment breakdowns in the rush hours, but in proportion to the traffic handled there has been little trouble.

The modern large steam railroad terminal with its half-dozen or so miles of track under a single roof and its intricate interlocking slip switches, becomes an easy prey to a snowstorm which would be regarded as far from serious by a trolley manager. The upsetting of a few train schedules in the busy hours is liable to paralyze the entire traffic of a terminal costing a score of million dollars. Highly organized as such a machine is, it is extremely sensitive to derangement and it often happens that a freight wreck in Michigan or Indiana cumulatively delays the movement of suburban trains at Boston 24 hours later by causing some fast through express to fall far behind its timetable at its destination. The smoke and steam emitted by the present type of locomotive, difficulties in firing boilers in zero weather, unprecedented volumes of traffic and other causes contribute to the steam railroad situation, but whether the ensuing delays are justified or not, the fact remains that the electric lines are reaping the benefit of their greater reliability and are making the most of a welcome class of business.

NEW SUBSTATIONS OF THE METROPOLITAN WEST SIDE ELEVATED RAILWAY COMPANY.

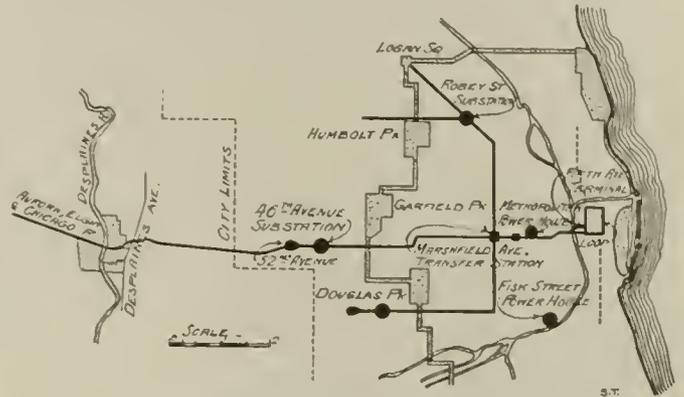

The Metropolitan West Side Elevated Railway Company of Chicago has recently put into operation two rotary-converter substations of interesting design. This company

supplied as direct current through the third rail and auxiliary feeders from a generating station between Loomis street and Throop street. This power house is located well downtown and as the lines have been built toward the west the feeders have been extended and enlarged until they have about reached the economical point for distribution with 600-volt current. While it might have been possible to increase the capacity of the generating station by the addition of a turbo-driven alternator, the physical conditions, with the power plant located as it is between two double-track elevated structures in a thickly built district, combined with the limited floor space

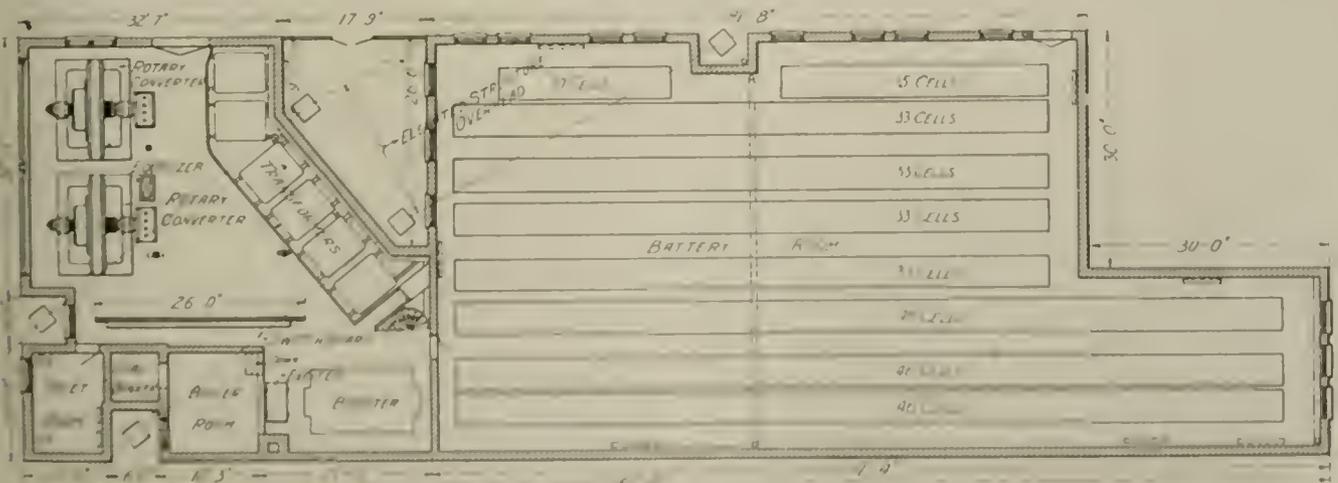

Metropolitan Elevated Railway—Floor Plan Forty-Sixth Avenue Substation.

operates 52 miles of elevated track consisting of a four-track structure from the connection with the Union elevated loop in the business district to Marshfield avenue, at which point the system divides into three double-track lines extending

Metropolitan Elevated Railway—Map Showing Location of Generating Stations and Substations.

and the difficulties incident to condensation and fuel supply, seemed to make it more advisable to obtain additional power from another source. When the amount of capital necessary to increase the capacity of this station, and its limiting features was compared with the cost of building rotary-converter substations and purchasing power, it was found that the substations had a favorable balance. By locating such substations at outlying points the investment for cables to carry both alternating and direct current, which would have been necessary with an increased capacity in this company's generating station, was not required. The present conditions warranted the building and equipping of two rotary-converter substations, one on the Garfield Park branch at Forty-Sixth avenue and the other near Robey street at the junction of the Humboldt Park and Logan Square branches, both substations to be operated with purchased power. At each of

Metropolitan Elevated Railway—Floor Plan Robey Street Substation.

north, south and west. The north branch again divides at Loomis street into two double-track lines extending west and northwest.

Heretofore, the power for operating all the cars has been

obtained from the power house at Loomis street and Throop street. The locations where batteries with booster sets had previously been operated. The rotary converter equipment now installed is the same for both stations, and therefore will be described for one station only. The physical conditions of the

ited the structures so that they are interesting in detail and will be described separately.

Robey Street Building.

The floor plan of the Robey street rotary-converter and battery station is shown in one of the accompanying illustrations. As the storage battery building and its equipment were already in operation at the time of planning for the rotary-converter equipment it was advisable to utilize for the substation the limited available real estate adjoining the battery room. The problem before the designers consisted of getting into this restricted space the largest capacity of apparatus possible. It should also be noted that this substation is directly under the elevated track-structure, making available a head room of only 12 feet. How well this problem has been solved is answered by the statement that this substation with a normal machine capacity of 4,500 kw. occupies a floor space of but 2,032 square feet, this area including a boiler room, coal bunker and toilet rooms. The unit capacity is 2.21 kw. per square foot of floor area.

This substation building at Robey street is of fireproof

nue substation there is floor space available for the addition of another unit with its transformers and switch apparatus. The rotary converters are wound for 25-cycle, 380-volt alternating current and 600-volt direct current, and operate at 250 revolutions per minute. The limited head room of 12 feet at the Robey street substation necessitated placing the rotary converters with their bed plates depressed so the top is only two inches above the floor level.

Each rotary converter is supplied with alternating current from three 550-kw., oil-insulated self-cooling transformers which have a ratio of 9,000 to 380 volts. The transformers are supported on I-beams so that there is a free circulation of air on all six sides of the cases. At the Robey street substation it was necessary to place the transformers at a lower level than the machine floor in order to provide head room for removing the cores, but at the Forty-sixth avenue substation the transformer cases rest on beams interconnected with the machine-floor structure. Here the high-tension gallery is directly above the transformers with a floor having heavy I-beams so placed as to make them available

Metropolitan Elevated Railway—Interior Forty-Sixth Avenue Substation.

construction with concrete foundations and roof, brick walls and steel window frames with wired glass.

Forty-Sixth Avenue Building.

Like the situation at the Robey street station the ground area at the Forty-sixth avenue location was also limited. The size of this building was determined by a battery house on one side, a car storage yard on another, the Garfield Park main-line elevated structure on the third side and the street line on the fourth. As will be noted from the illustrations, the arrangement of this substation conforms more to standard practice than that of the Robey street station.

The Forty-sixth avenue substation building is 39 feet wide by 66 feet long and of rectangular shape joining at one end with the storage battery room. The building is of neat design and of the fireproof type with concrete floors, brick walls and cement tile roof supported by steel trusses.

Rotary and Transformer Equipment.

Each substation has two 1,500-kw. capacity compound-wound Westinghouse rotary converters with mechanical oscillators and speed-limiting devices. In the Forty-sixth ave-

ue substation there is floor space available for the addition of another unit with its transformers and switch apparatus. It will be noted that at this station the switchboard is set at a sufficient distance from the transformers to allow cores to be handled between it and the transformer cases.

Storage Battery Equipment.

The storage battery equipment at the Robey street substation comprises 295 cells with 49 type-R elements each. This battery has a one-hour rate of 2,880 amperes.

The battery at the Forty-sixth avenue station consists of 296 cells of 49 type-G elements each and has a one-hour discharge rate of 1,920 amperes. Both batteries were furnished some few years ago by the Electric Storage Battery Company of Philadelphia.

Switchboards.

The switchboards for the two stations are alike except that one is assembled righthand and the other lefthand. Each board comprises the following panels with their complements of instruments:

Two high-tension panels with oil-switch levers, and three-phase integrating wattmeter on entering lines.

Two alternating-current rotary-converter panels, each having

three single-pole switches, one for each phase, one three-pole single-throw starting-motor switch, one two-pole single-throw synchronizing-rheostat switch, an alternating-current ammeter for measuring the input to each rotary and a power-factor meter.

0000 conductors insulated with paper. It is interesting to note that the two cables to each substation are laid in separate duct systems following different routes between the power house and substation so far as was practicable.

Two direct-current rotary-converter panels each with a positive and a negative main switch, integrating direct-current watt-

Metropolitan Elevated Railway—Exterior Robey Street Substation Showing Elevated Structure Above.

meter, an ammeter, 3,000-ampere circuit-breaker, rheostat handle and voltmeter plug.

Battery regulating panel with a carbon regulator operated from the main bus.

Six standard feeder panels, each with a circuit-breaker, ammeter and single-throw switch.

Three panels for controlling the battery booster, motor and exciter sets.

Arrangement of Circuits.

Each station is supplied with 9,000-volt, 25-cycle alternat-

As the cables enter the substation they end in terminal bells and each conductor has a disconnecting knife switch. From the knife switches the conductors are led to non-automatic oil switches in series with automatic overload-trip oil switches. Between these two oil switches, which afford flexibility of operation in case of feeder cable troubles, there is a set of disconnecting knife switches. From the auto-

Metropolitan Elevated Railway—Interior Robey Street Substation.

ing current through two independent high-tension cables from the Fisk street station of the Commonwealth Electric Company (in one case 9½ miles and in the other 6 miles distant). These cables are of the three-core type consisting of No

matte oil switch the high-tension conductors are led direct to the primary terminals of the step-down transformers.

The arrangement of the automatic and non-automatic oil switches in the 9,000-volt conductors is such that both or

either one of the rotaries may be operated from either incoming high-tension line. Under normal operating conditions one rotary is operated from each line with the tie switches open so that if the high-tension supply is interrupted on either line but one rotary will be affected.

From the low-tension side of the transformers the alternating current is taken direct to the rotary-converter panels on the switchboard so that each phase may be connected through the medium of the single-pole switches to the three-slip rings of the rotaries.

The rotary converters are started by separate motors mounted on the same shaft as the rotary converter armatures. The current supply for these motors is taken from the low-tension side of the transformers at the machine panels of the switchboard.

From the brushes on the direct-current side of the rotary both the positive and negative conductors are taken to the switchboard through the switches and direct-current instruments to the buses from which the feeders leading to the third rail through the feeder panels and ground return cables are connected.

Results of Operation.

With the combination of instruments as used in these substations the total alternating-current input and the total direct-current output are measured direct, their ratio giving the station efficiency. By comparison with the measurements taken at the generating station it is possible to get a definite idea as to the line loss.

The contract under which the Metropolitan company buys its current at present, provides for a maximum of 4,000 kw. and as the railway company can utilize the total output of the substations to a good advantage it is interesting to note how high the load factor has been maintained. During the first month of operation this factor was 76 per cent and for the month of December, the second month of operation, the load factor was increased to 85 per cent and it is anticipated that this figure can be maintained. This unusually high load factor is made possible by the use of the storage batteries which are charged during the light midday loads and at night, and discharged at periods of heavy load to cut down the peaks.

Since the new substations have been in operation it has also frequently been found possible to operate the entire elevated system of the Metropolitan company from 9 p. m. to 5 a. m. from the substations permitting the power house to shut down for convenience in making repairs, and overhauling equipment.

The construction of these interesting substations and the operation and maintenance of the motive power and way of the Metropolitan West Side Elevated Railway Company are in charge of Mr. B. H. Glover to whom thanks are due for the information contained in this description. Acknowledgment is also made to the Commonwealth Electric Company for interior views of the substations.

The production of pig iron and steel throughout the world last year is estimated at 60,524,505 tons, as compared with 40,543,000 tons in 1900, showing a probable increase in five years of no less than 19,981,505 tons. The output in the United States is set down at 25,602,000 tons; that of Germany, at 12,273,935 tons; that of the United Kingdom at 10,105,000 tons; that of France, at 3,873,504 tons; that of Russia, at 3,000,000 tons; that of Austria and Hungary, at 2,000,000 tons, and that of Belgium at 1,448,065 tons. The figures are necessarily only approximate; but they exhibit an astonishing advance in production during the last six years, the increase of the seven principal metallurgical countries being as follows:—United States, 11,813,000 tons; Germany, 3,778,936 tons; United Kingdom, 1,197,000 tons; France, 1,174,504 tons; Russia, 125,000 tons; Austria and Hungary, 460,000 tons, and Belgium, 430,065 tons.

CENTRALIZATION AT NASHVILLE.

It has long been agreed that an ideal condition for city street railway operation would obtain were it possible to locate the power house and car barns at a point not far distant from the traffic center, and yet few instances can be cited where this has actually been accomplished. The traffic center is usually near the heart of a city where the property has a value for commercial purposes that makes it almost prohibitive for street railway buildings. There usually is also a public sentiment that prevents the locating of car houses, shops and power plants in or near shopping and the business districts.

One of the exceptions that can be cited is Nashville, Tenn., where the Nashville Railway & Light Company has approached the ideal condition to a remarkable degree. This company's transfer station, from which all cars are started on their runs and at which point about 99 per cent of all transfers of passengers are made is located near Deadrick street and occupies the entire block between Third and Fourth avenues—less than two squares from the business district and just opposite the public square. One square to the north of the station are the car houses and shops, and two squares to the east is the power house.

The money saved annually by this comparatively unique situation cannot readily be estimated in dollars and cents, but from the fact that cars are never required to dead-head more than one square before taking their regular schedule, it will be seen that the dead mileage, and the cost of getting the car from the barn to the center of traffic is reduced to a minimum. The advantages of having the power house located at the point from which the peak load is drawn is also apparent.

During the past year the Nashville Railway & Light Company has expended nearly \$2,000,000 in new work. This includes the construction of a new car house, repair, paint and carpenter shops—at a cost of about \$250,000—the remodeling and enlarging of the power station and rebuilding the tracks outside of the paved district of the city. During the present year the tracks in the down-town district will be relaid with 7 or 9-inch rail.

The Nashville Railway & Light Company is one of the properties of Isadore Newman & Son's of New York, and though it is operated entirely distinct from the affiliated companies it is closely allied with them.

The affiliated companies are the Knoxville Railway & Light Company, Birmingham Railway Light & Power Company, Little Rock Railway & Electric Company, Memphis Street Railway Company and the Houston Electric Light & Power Company. The financial interests of these companies maintain a consulting, auditing and operating department for railways, the duties of the superintendents of which are to visit the various properties and by co-operation with the heads of the local departments aid in solving the intricate problems with a view toward the possible reduction of maintenance and operation expense, increasing of the revenues and providing better service for the public. Mr. Hugh M. Beugler, formerly associated with the Elmira (N. Y.) Water Light & Railroad Company, is advisory superintendent of the railway operating department of the Newman interests; Messrs. Ford, Bacon & Davis are the company's engineers and have charge of all improvements.

The officials of the Nashville Railway & Light Company are: Percy Warner, president; J. H. Fall, vice-president; H. C. Walters, secretary and treasurer; H. A. Davis, superintendent of railway, and J. P. W. Brown, superintendent of lighting.

On account of the shortage of fuel in the northwest, Manager W. S. Dimmock of the Tacoma Railway & Power Company has given orders to the trainmen that all construction, freight and passenger business for a limited time be made secondary to the handling of cars carrying fire-wood.

NEW YORK STREET RAILWAY ASSOCIATION.

The quarterly meeting of the Street Railway Association of the State of New York was held on January 11 at the Hotel Iroquois, Buffalo. The register, which was circulated in lieu of roll-call, showed 51 in attendance as follows:

Those Present.

LeGrand Brown, consulting engineer, Rochester.
 W. R. W. Griffin, superintendent, Rochester & Eastern Rapid Railway, Canandaigua.
 R. P. Stevens, general superintendent, Auburn & Syracuse Electric Railway, Auburn.
 I. E. Matthews, chief engineer, Rochester Railway Company, Rochester.
 C. B. Fairchild, Jr., Electric Traction Weekly, Cleveland, O.
 E. P. Roundey, engineer maintenance of way, Syracuse Rapid Transit Company, Syracuse.
 Charles H. Clark, engineer maintenance of way, Cleveland Electric Railway Company, Cleveland, O.
 M. J. French, engineer maintenance of way, Utica & Mohawk Valley Railway Company, Utica.
 F. A. Bagg, chief engineer, Fonda Johnstown & Gloversville Railroad Company, Gloversville.
 Francis W. Lane, Electric Railway Review, New York City.
 T. W. Wilson, general manager, International Railway Company, Buffalo.
 Albert H. Stanley, general manager, Public Service Corporation of New Jersey, Newark, N. J.
 Charles L. Wilson, traffic manager, Toronto & York Radial Railway Company, Toronto, Canada.
 J. S. McKechnie, chief engineer, Toronto & York Radial Railway Company, Toronto, Canada.
 John E. Duffy, superintendent, Syracuse Rapid Transit Railway Company, Syracuse.
 E. T. Peck, general manager, Schenectady Railway Company, Schenectady.
 Andrew J. Farrell, claim agent, International Railway Company, Buffalo.
 E. E. Hawkins, president and treasurer, Ogdensburg Street Railway, Ogdensburg.
 A. R. Meyers, electrical engineer, Buffalo & Lake Erie Traction Company, Buffalo.
 F. D. Jackson, superintendent of track, International Railway Company, Buffalo.
 H. L. Mack, superintendent of line, International Railway Company, Buffalo.
 George C. Graham, superintendent of car equipment, International Railway Company, Buffalo.
 W. W. Myers, paving inspector, International Railway Company, Buffalo.
 F. Symons, Peekskill Lighting & Railroad Company, Peekskill.
 Stuart Wilder, vice-president and general manager, Peekskill Lighting & Railroad Company, Peekskill.
 J. L. Holmes, roadmaster, Rochester & Eastern Rapid Railway Company, Canandaigua.
 W. F. Burket, superintendent of line, Rochester & Eastern Rapid Railway Company, Canandaigua.
 B. V. Swenson, secretary and treasurer, American Street & Interurban Railway Association, New York City.
 B. Wilbur, roadmaster, Syracuse Rapid Transit Company, Syracuse.
 E. D. Watkins, manager, Lima & Honeoye Falls Railroad Company, Lima.
 B. L. Coy, division superintendent, International Railway Company, Buffalo.
 C. A. Coons, superintendent of transportation International Railway Company, Buffalo.
 William A. Hinkle, assistant engineer, J. G. White & Co., New York City.
 Jos. D. Evans, division superintendent, J. G. White & Co., Albion.
 G. A. Harvey, electrical engineer, International Railway Company, Buffalo.
 John Hanf, master mechanic, International Railway Company, Buffalo.
 W. J. Harvie, electrical engineer, Utica & Mohawk Valley Railway Company, Utica.
 Henry W. Blake, Street Railway Journal, New York City.
 C. Gordon Reel, general manager, Kingston Consolidated Railroad Company, Kingston.
 H. Penoyer, engineer track and roadway, Schenectady Railway Company, Schenectady.
 M. Sheehan, division superintendent, International Railway Company, Lockport.
 J. N. Shannahan, general manager, Fonda Johnstown & Gloversville Railroad Company, Gloversville.
 J. H. Pardee, general manager, Rochester & Eastern Rapid Railway Company, Canandaigua.
 W. Jackson, Street Railway Journal, New York City.
 P. N. Wilson, roadmaster, Rochester Railway Company, Rochester.
 R. E. Dunforth, general manager, Rochester Railway Company, Rochester.
 Julius C. Gilch, general manager, Buffalo & Lake Erie Traction Company, Buffalo.
 E. H. Hubel, general auditor, Buffalo & Lake Erie Traction Company, Buffalo.

R. J. Garvin, superintendent of buildings, International Railway Company, Buffalo.

George Chambers, tax agent, International Railway Company, Buffalo.

H. J. Pierce, president, International Railway Company, Buffalo.

President J. N. Shannahan, of Gloversville, called the meeting to order and announced that at this quarterly conference, the executive committee had determined to devote the entire meeting to a discussion of "Track, Roadway and Overhead Lines," and the meeting proceeded immediately to the reading of the papers and their discussion.

Track Construction in Paved Streets.

The first paper was on "Track Construction in Paved Streets," by I. E. Matthews, chief engineer maintenance of way, Rochester Railway Company, which appears elsewhere.

In connection with this paper was taken up that by F. D. Jackson, superintendent of track, International Traction Company, Buffalo, on "Concrete Stringers and Concrete Stringers with Ties and Steel Ties" and also one entitled "Tie Plates, Braced Tie Plates and Tie Rods," by E. P. Roundey, superintendent of tracks, Syracuse Rapid Transit Company. (The latter paper was published in the Electric Railway Review of January 12 and the former appears elsewhere.)

Mr. F. A. Bagg (Fonda, Johnstown & Gloversville) asked Mr. Matthews if his estimate of cost included the cost of the paving, to which Mr. Matthews replied that in each case all the figures he gave included not only the cost of the track, but the cost of the paving itself. In Rochester roads are required to maintain the pavement between the tracks and two feet outside of the track. About \$2.75 or \$2.80 was paid for block stone.

Mr. LeGrand Brown (Rochester) asked Mr. Matthews if on the track laid where every third steel tie was carried across, it helped to maintain the track. At that time the track was laid with 4½-inch, old Johnson section-B rail, inverted and clasped with clips, every third one running across.

Mr. Matthews said that that track was practically as good today as when it was laid, that is, in brick pavement. The track deteriorated next to the rail to some extent, due to heavy wagon traffic, but the track itself is in perfect condition.

Mr. M. J. French (Utica & Mohawk Valley) asked both Mr. Matthews and Mr. Jackson their opinion as to the relative noisiness of the concrete construction and the old construction in which the broken stone was used underneath and the regular paving above that, as compared with the construction in which the steel ties and entire concrete construction is used. He found that was a great argument against the concrete construction. Mr. Matthews thought there would be possibly a little more rumbling, but did not think the concrete construction with steel ties very objectionable on account of the noise.

Mr. E. P. Roundey (Syracuse Rapid Transit) asked Mr. Matthews what was the object of using a full-grooved rail in paved streets. Mr. Matthews replied that the city authorities in Rochester would not allow the use of a regular girder rail; only a grooved girder rail. He thought the full grooved rail made a better looking pavement, and possibly a better track in some respects. Certain grooves would be very objectionable on account of filling up with dirt in winter and getting clogged with ice and snow. The Trilby rail section is objectionable in that respect, but sections are now made which have a wider groove and which seem to be very satisfactory.

Mr. Charles H. Clark (Cleveland Electric) asked if there was any trouble with suburban cars going over Trilby rails. To which Mr. Matthews replied that his suburban cars did not have a very large flange and they did not have any trouble. Mr. Clark explained that in Cleveland, on Lake

avenue, where the Lake Shore electric comes in, they had the Trilby rail and had had a great deal of complaint from the Lake Shore people on account of flanges breaking, the inside of the flange of the wheels rubbing against the inside of the flange of the Trilby rail and this, of course, had a tendency to press the wheels outward on the bottom, breaking the flanges. They wanted all the rails ground, so as to reduce the flange, but it was concluded to widen the gauge on account of their heavy flanges.

Mr. W. R. W. Griffin (Rochester & Eastern) said that the Rochester & Eastern came in over the Rochester Railway track, and a portion of the Trilby rails happened to be very narrow, made for a $\frac{3}{4}$ -inch flange, and the trouble found was with the inside gauge. They had to set out the wheels somewhat more than $\frac{1}{8}$ inch and regauge the track to overcome the difficulty. The first cars which came in on these tracks used cast wheels, and the tracks broke the flanges very badly, but after it was recognized that the inside gauge had to be widened out, and after steel wheels were put on there was no trouble.

Referring to the matter of noise Mr. F. D. Jackson (International Railway) said that there might be more noise on solid concrete construction, because it is more rigid, but it would depend on conditions. For instance, on a wet day, or on a day when the rail was perfectly clean, the rumbling noise was not any more than with the other style of construction, but that on a dry day, when sand gets on the rail, it would naturally make more rumbling because there is less yield to the substructure.

Mr. Charles L. Wilson (Toronto & York Radial) asked if any of the members had any experience in using sand or coarse gravel in making up the mixture for concrete, instead of broken stone. Broken stone was becoming more and more difficult to get. He had had several pieces of track put down in which coarse gravel was used in place of broken stone, and had had very good results. Mr. C. H. Clark referred to the Herkimer bridge, at Utica, and said the concrete mixture used in that construction was made of gravel, no broken stone being used. Mr. LeGrand Brown had put in a large quantity of gravel in some paving work which he did in Canada, and his opinion was that it made better concrete than the ordinary broken stone. Mr. Clark added that it was important that concrete should be mixed accurately. He used a 3-foot cubical box and filled it level full with gravel. Water was poured into it until the box was filled with the water and gravel. The amount of water placed in the box gave the amount of the voids in the gravel. In that way the quality of the concrete could be determined exactly. He believed the best concrete was obtained by making it out of gravel, but there must be no guesswork in the mixing of the concrete. On the Herkimer bridge the proportions were 1— $2\frac{1}{2}$ — $5\frac{1}{2}$.

Mr. Roundey said he took gravel just as it came from the bed, and considered that he got a better job of concrete than city contractors who use crushed stone and sand. The proportions were about 1—3—7, mixed in a box without a bottom.

Mr. M. J. French said that in 1894 he laid some gravel concrete, mixing it in proportion of 1 of cement to 10 of gravel. A paving contractor had occasion afterward to dig across one of the trenches in which the concrete had been used, and he said it was the toughest concrete he ever struck. There was no doubt in his mind but that the ideal concrete material is composed of all sizes of stone, the smaller sizes of stone filling the voids of the other, and in using gravel one was more likely to get the voids filled. The concrete composed simply of sand and 2-inch stone was apt to be a rather poor concrete.

Mr. B. Penoyer (Schenectady Railway) said he used crushed stone, measured the proportions in a box and used 1—2—6. He said concrete stood much better than the con-

crete as put in by the city, in the paving alongside the track.

Mr. F. A. Bagg (Fonda Johnstown & Gloversville) referring to Mr. Jackson's paper said it seemed to him that the steel ties placed 10 feet apart had not a very important part to play in the track construction after the concrete had set and asked if an ordinary yellow pine tie would not answer just as well as a steel tie. Assuming that the concrete was set and the work all done, if the steel tie were eliminated, he asked if the track would not stand almost as well. To which Mr. Jackson replied that it might stand almost as well, but the tie plays the part of holding the gauge while the construction is going on, and also after. The concrete is brought only up to the tread. If the concrete should break, on account of the pounding of the cars over it, the tie acted to hold the track in place. With a Carnegie steel tie he thought there was better holding power, because of the holding power of the cement against the web and also underneath the top flange. If the concrete should settle, or the bottom should settle underneath the concrete, between the ties, then the ties would act as a support in that particular case.

Mr. T. W. Wilson (International Railway) said that there was one point which Mr. Jackson did not bring out clearly, and that was that the concrete extends under the steel tie, so that the tie itself is supported by 6 inches of concrete. As for the use of wooden ties, the life of wooden ties is from 8 to 10 years, or possibly 12 years, and it is figured that the tracks should last at least 15 years, and it seemed to be poor economy to put a wooden tie in permanent construction of that sort. He believed tracks could be relaid after the rail is worn out, simply by taking out the stone, removing the rail, and replacing a new rail on the steel ties, without removing the base of the track.

Mr. C. H. Clark said he was using Carnegie steel ties in Cleveland, laid on 5-foot centers. He put 6 inches of concrete between the tracks and 4 inches under the Carnegie steel tie, which gave 10 inches of concrete and tie-rods every 5 feet.

Mr. French asked Mr. Jackson whether they had any occasion to take up any of the rails over the steel ties, and whether there was difficulty in replacing any given portion of the track, as far as gauge is concerned, i. e., the clips holding it to gauge; whether there was any wear that would make a loose gauge. Mr. Jackson said he had only just started the construction this year, but saw no reason why there should be any trouble at all, because it would only require a bolt to be used or different clips to be used in special places.

Mr. M. J. French, in answer to Mr. Bagg's question, stated that in Utica he had used a few Carnegie steel ties during the past year, and instead of stopping the concrete at the bottom of the rail, had brought it up 2 inches over the base of the rail, and in that way they got the whole steel structure bound into the concrete, so that there was no liability of a movement of the rail. They had to be careful in tamping the concrete thoroughly under the rail on account of the natural shrinkage of the concrete as it dried out.

Mr. Clark said that could not be done with block stone pavement; it might be done with brick pavement, or with 7-inch block, no cushion. Mr. Roundey said that in Syracuse, where the concrete came 4 inches above the top of the tie, it would not hold the rails to gauge. It might be due to the concrete. He knew the concrete was not good; it was put in ten years ago; and he thought it was natural cement. He did not think concrete was of much use in holding a track to gauge; it might support it. Mr. French's idea was not to use the concrete to hold the track to gauge, but to prevent vertical motion. He would not lay a track without tie-rods in it, with the present type of car. Mr. T.

W. Wilson said in connection with Mr. Clark's statement, that was one of the criticisms which has been made on tracks in Buffalo, and it was a question in his mind whether they should not increase the number of steel ties and put them 5 feet apart instead of 10 feet, and also put the tie-rods 5 feet apart. On the steel tie question he expressed the opinion that a steel tie 4 inches deep was sufficient for street railway work, this year the Carnegie Steel Company, at his suggestion, rolled a steel tie 4 inches deep, and 41 cents cheaper than the 6-inch. As to concrete, either gravel or stone concrete was all right. There were two things to be considered in connection with concrete; first, the cement, and second, the method of mixing. The cement should be good standard Portland cement.

Mr. LeGrand Brown said that the track put down in 1899, in Rochester, was all 4½-inch steel ties made of old rail.

Mr. I. E. Matthews (Rochester) asked Mr. Jackson, in the use of the steel tie, where the street has been torn up, whether they used a long tie to connect the two tracks together.

Mr. Jackson said they used tie-rods and made each track independent of the other. They used 60-foot, 85-pound T rails and also 60-foot 100-pound T-rails. He said there was no trouble from getting out of line and there were only half the number of joints, and half the number of bonds.

Mr. A. H. Stanley (Public Service Corporation of N. J.) asked if any one knew of a failure through the use of concrete in track construction. He knew of a large city, where they had used a good deal of concrete in their track construction, and every mile of track they laid, using the concrete under the ties, either metal ties or wooden ties, had to be rebuilt. None of it lasted ten years. That track construction provided for 6 inches of concrete underneath the tie, and later on that was increased to 13 inches. There could be no criticism about the method adopted in the construction of that track. It was, he said, built in the best possible manner, using the best kinds of material, employing either brace plates or tie-rods, both 9-inch and 7-inch rail. The tracks in question were single-track roads, light traffic, streets with heavy traffic, with the interurban cars weighing not to exceed 65,000 pounds. That experience had been of value to him in the reconstruction of the tracks in properties in New Jersey, on which they were building a great many miles of track each year, and practically all of it on public streets. There broken stone was used entirely, there was no concrete used underneath the ties. The only place concrete was used was between the ties for supporting the paving. The subgrade was rolled before any stone was put on it, with a 15-ton roller. Many soft spots were found and in every instance they were able to pound down the grade at least 2 inches by the use of the roller; in some places 3 inches. As the stone was laid on the subgrade, it was rolled, and the process continued until there was 6 inches of foundation. The ties were laid and the ends tamped, and the cars put on the track as soon as the rail was laid, the idea being to get as much weight as possible and as soon as possible on the track. The concrete was then put between the ties to the proper depth, depending on the pavement used. Some of that track had been laid for three years, and there was not the slightest depression. The interstices between the rails were filled with cement grout, making it as nearly water-proof as possible, and there was no deflection in the pavement or the rail. It appeared to him as if he was in the enemy's country in the use of concrete. In reply to a question of Mr. French as to the manner in which the structure failed, Mr. Stanley replied that the concrete broke—the rail broke through the concrete. Almost immediately after the heavy cars were put on, it started to break through and the metal tie buckled, and threw the track out of gauge. These ties were placed in some instances 10 feet apart in

other cases 5 feet, 3 feet and 2½ feet, and all sorts of methods were used to keep the track up.

Mr. F. Simmons (Peekskill Lighting & Railroad) asked if it was the practice to continue to operate the cars over the road during the setting of the concrete. Mr. Stanley replied that where the concrete was used the track was idle for seven days, and in most instances for fourteen days.

Mr. M. J. French thought Mr. Stanley's objection to the concrete must be from the fact that it was poor concrete, and nothing else, if it would not stand as well as loose broken stone under the car. The concrete had the stone and the cement in it, whereas Mr. Stanley simply had the loose stone in the present work he is doing.

Mr. Matthews described an experience of a couple of years ago in the case of concrete construction, where a waterpipe broke underneath the pavement and washed out a large hole under the concrete 3 feet in depth, and the track was operated over that washout for some time before it was discovered. The concrete did not give way.

Mr. C. H. Clark had the same experience in Cleveland. For six months a depression was noticed. The city sent its men to the place and started to repair the pavement, and they found there was a hole under the track probably six or eight feet wide caused by a broken waterpipe, and the water flowed into the sewer, under the solid concrete track construction.

Mr. C. B. Fairchild, Jr., related an instance where they did a great deal of concrete work. There was the same trouble Mr. Stanley spoke of, and after a long series of experiments the depth of the concrete was increased to 18 inches, and there was no further trouble.

Mr. Stanley said the point he wanted to make was the advantage of using concrete over the broken stone, if broken stone is cheaper. Mr. F. D. Jackson asked, if with the use of broken stone, the pavement would stand up against the rail as well as if concrete were used, and if in time the rail and ties would not work and allow moisture to go down underneath the stone, and the pavement settle from the rail. Mr. Stanley replied that in his territory there was as heavy teaming as exists anywhere in the United States. The track had only been down three years, but there was not the slightest break in the track, nor the slightest depression.

Mr. William A. Helndle (J. G. White Co.) stated that he had had some experience in track laying, principally in the English type of construction, entirely of concrete, using no ties or sleepers whatever. His company had had a great deal of the solid mattress type of track construction in connection with its foreign contracts, bedding the rails entirely on the concrete and on stringers alone, having a stringer under each rail from 9 to 12 inches deep and 18 inches wide. The whole secret of that type of construction was the foundation and the absence of water. It had been found in the English type of concrete construction, or in any type of concrete construction, if there was a bad foundation or an excess of water, moisture, or anything of that kind, the rail would eventually begin to pump, rise up and down, and follow the motion of the car, and this was increased until the concrete immediately under the base of the rail was worked up into a powder. The concrete in time would flow away and give a greater rise and fall of the rail. Traffic here was considerably heavier than they had in England, but there they were confined entirely to concrete stringer construction, very heavy grooved glider rail, and these gave the best results, but the cost of installation was very great.

The president announced that there had been an invitation extended to the members in attendance at the quarterly conference by the Central Railway Club to attend its annual banquet to be held in the hotel that night at 7 o'clock.

Standard Rail Sections.

Mr. C. Gordon Reed, general manager, Klugston Connell

dated Railway, presented a paper on "Standard Rail Sections for Paved Streets."

(On account of the illustrations forming a part of Mr. Reel's paper which could not be prepared in time for publication this week, the discussion upon the paper is also omitted, and will be published with the paper next week.)

Rail Joints.

The first paper on the subject, "Rail Joints," was on "Thermit Welding," by Mr. M. J. French, engineer maintenance of way, Utica & Mohawk Valley Railway Company.

Mr. French read the paper as published elsewhere, and Mr. P. N. Wilson, roadmaster, Rochester Railway Company, presented the paper on "Electric Welding," which is given in another column.

Mr. Wilson concluded by asking a question. "The cost of putting on step joints, or bonds, labor and material is more by about one dollar than welding all the joints. The cost of putting on a 9-inch improved mechanical joint is about the same as the welding cost. Why does the general manager not weld?"

Mr. T. W. Wilson (International Railway Co.) answered that he was one of the general managers who does weld, and believes he had more welded track than any city in the country. But he was obliged to say that lately he had been getting away from the electrically welded joint. In the first place, it was hard to weld the joints in the beginning. A certain number of joints must be guaranteed daily—four joints an hour. If anything went wrong the company was under penalty to pay for the hours that the welder remained idle. He added that they had breakages every year on track that was welded in 1899. There were breakages last year. The first year after welding there was a number of breakages. They always occurred in the winter, and it was quite an item of cost to cut out the broken joints and replace them. They cannot be welded because there is no welder at hand. Continuity was broken until the welder was on hand again. Of late years he had been getting away from the electrically welded joints. It was an admirable joint, he said, after it was welded—the Main street track in Buffalo is all electrically welded—but the question of repairs made it a question in his mind whether it was economical to weld joints.

As to the thermit weld, he had been looking with interest on its record. He thought that there was a great deal in the future for the thermit weld. The reason was that it did not require any large mechanism or a train of cars to apply it. The electric weld would be a better joint if it could be put on with a brush and pot, but the trouble was it was necessary to have a machine and it was impossible, except by owning one of the machines, to keep up the track. On some new track work to be done this year he was seriously considering going to the Nichols riveted joint, such as used almost exclusively in Philadelphia. He said this had been used by the Philadelphia Rapid Transit Company for their standard since March, 1901, and since that time they had laid over 135 miles of track in which this joint had been used. It is a riveted joint, riveted to the web of the rail, and the return is obtained by means of spelter, both in the base and the head. The question of electrical return is one point about the joint he was not entirely satisfied with. As a mechanical joint Mr. Wilson was of the opinion that it was the best mechanical joint on the market. He then asked Mr. Clark for a description of the joint that was in use in Cleveland; a combination of a riveted joint, and on the base of the rail, in order to make the conductivity, a small thermit weld.

Mr. C. H. Clark (Cleveland Electric Railway) said that in Cleveland they, perhaps, had had more experience with joints than in any city of the United States. They had the old electric weld, the chuck weld, the cast weld, the new electric weld, the thermit weld, continuous joint plates, the Weber joint plates, Atlas joint plates, the common joint

plates, and the Clark joint. During the year 1905, they placed about 3,500 thermit welds and in the year 1906, concluded they would not use the thermit weld. He had this to contend with in Cleveland—in case of a broken joint it was necessary to get a permit and state the exact time of making the opening, and pay a city inspector 46 cents an hour to watch the work. If there was only one joint broken, it would take five hours from the time of making the opening to get the weld on and get it paved up, even if the pavers came right to the spot and attended to the job as soon as the repairs had been made. One could consider that he had spent \$2.30 for politics. He concluded he would try the combination between a common joint and a thermit. The rail was drilled for the common wrought splice bar, such as the Lorain Steel Company and the Pennsylvania Steel Company furnish. The holes in the rail are drilled 11-16 inch, and the holes in the plates are round holes 11-16 inch. He rigged up a car with two Christensen air pumps, No. 2, having a bank of tanks, and used an air reamer. The holes were reamed to 1½ inch and a 1½-inch machine bolt for hexagonal nuts and hexagonal heads was used to make a dry fitting bolt. In laying the rail, two holes were reamed by hand and the workman applied two bolts in these holes and screwed them up as tight as he could get them. Then the car came along, carrying the bolts for the rest of the joints so that the bolts were not lying on the ground and getting rusty. The man in charge of the car reamed the holes and placed the bolts in and the workmen followed along and tightened them up. As a general rule there were five or six jobs going on at the same time, and the men could run from one job to another. Then the thermit car came. The weld which was placed on the base of the rail was the same size as the regular thermit weld, only it was placed across the base of the rail. At first this weld was ½-inch thick at the edge of the base of the rail, and ¾-inch thick at the center. Sawing the joints in two, to see how much of the joint was welded, it was found that the center of the rail was not welded, and it was concluded that the steel was settling in the bottom of the mold and by the time it got to the rail it had cooled sufficiently so that it would not weld. After that, instead of making the weld ¾-inch thick in the web of the rail, it was made 1¼-inch thick. This caused the hot steel to flow from one side to the other continuously, and in this way he succeeded in welding the base of the rail thoroughly, and up into the web. Joints sawed in two showed a perfect weld, and the strength of the joint was greatly increased. There was about 6 inches of solid welded metal, the size of the weld and the base of the rail together making about 6 inches of metal. If that is figured at 40,000 pounds for tensile strength, it would give 120 tons pull at this point. He considered that the six bolts on each side of the joint will stand a safe shear, being a double shear of 90 tons, so that he did not believe that the rail would ever break at the joint. When concreting, a hole was left at the joint. The welder came along after the concreting had been done, and then the hole was filled up with concrete. He said he had placed about 3,000 of them and had not found a broken joint. The electricians tested out one rail on Jennings avenue, 85 rails laid continuously in the street, and not one of them showed a leak. They all tested 3 feet. Mr. Clark stated that the cost of the joint was \$1.75 for the thermit, using 7 pounds of pure thermit, and about ½ pound of steel. The joint plates cost, when bought with the rail, \$37.50 a ton. The reamer could do seven joints an hour, two men placing the joints in the street. Sixteen cents would place the bolts in the joint. Welding was done by a crew of five men, four men at \$1.80 and \$3.00 for the foreman, making a total of \$10.20 a day. They could do 75 joints a day easily. The welding cost about 25 cents, making the total cost of the joint \$4.24, or at most under \$4.50. He believed he had an absolutely perfect joint so far. The rails had been tested

after cold weather—85 of the rails. 62 feet long—but it had been impossible to find a break. There is the further feature that if breaks occur, it is not known, because the joint plates there hold the rails at all times. It is the policy to keep a couple of men going over the track testing for breaks in the joints. If a break is found, they use a rail-pin that will braze on the side of the rail, but they had not had occasion to put a pin on any of the joints which were laid last summer.

Mr. T. W. Wilson asked if riveting the joint would not improve it. Mr. Clark said the reason he did not rivet the joints was that this year he was experimenting, and that during the coming year he would probably rivet.

The president announced that Mr. Pierce, president of the International Railway Company, and Mr. T. W. Wilson, general manager of the company, had invited the members in attendance, and the representatives of supply houses present, to luncheon. He also read a letter from Mr. W. Caryl Ely, the former president of the American Street and Interurban Railway Association, in which he regretted his inability to be present at the meeting.

Prof. Swenson was called upon to say a few words about the work of the American Association.

Remarks of Prof. Swenson.

Prof. B. V. Swenson—Mr. Brockway, the president of our Accountants' association, said at the convention which we had at Columbus, when he attended the meeting of the Engineering association, and was called upon unexpectedly to make some remarks, that he came to "Stop, Look and Listen." That is exactly my purpose here. I came not to say anything before this meeting, but to get some new ideas, get more thoroughly in touch with your work, and get more acquainted with the people of the State association. I attended the quarterly meetings at Elmira and Schenectady last year, and also the annual meeting at Saratoga. I was particularly impressed last year, and I am again today, with the great importance of these quarterly meetings which you began a year ago at Schenectady. It seems to me a great deal more good, solid work can be obtained through these meetings where you gather around in a small room, where everybody gives free expression of his opinion, but I am sorry that we cannot have just such meetings in our National organization. That, of course, is quite out of the question, because we cannot have more than one meeting a year and that must be a large convention. But to get together and take up topics such as you have been doing today and at the other quarterly meetings, and discuss them in a sort of heart-to-heart way, it seems to me would bring out many points that are extremely valuable from the standpoint of the experiences of the various people present. These meetings cannot help but be a very great good, not only to your association, but also to all the street railway people in the country.

I want to say that twice this week I have talked with Mr. Ely over the long distance phone from New York to Buffalo, and we have talked about this meeting, and he fully expected to be here—in fact, up to yesterday, when he talked with me again and said it was quite out of the question.

So far as the National organization is concerned, I want to say that the year opened up very well for us and things are going along very nicely. We sent out just a week ago our annual statement for dues, and we have already received a large number of remittances of annual dues, which is very encouraging. Our reports this year will be quite luminous. We have four associations, and each of them this year has a report. They will average at least 350 pages each and will make a book of about 1,400 pages, as I figure. We expect to bind these in two volumes, one of which will contain proceedings of the American Engineering Association and the other those of the Accountants' and Claim Agents'. The reason we do it that way is that the Accountants' and Claim Agents' proceedings are strictly member company proceedings and only go to member companies, whereas the Engineering and American proceedings also go to all associate members, irrespective of whether or not they belong to member companies. We expect to bind these proceedings in good cloth bound volumes. Each associate member will receive a cloth bound volume, not a paper covered volume, such as used to be given out. In that way we hope our proceedings will be considered of greater value than in the past, and better care taken of them.

I cannot help but take this opportunity to say a word or two about associate membership in the American association. Of course you know, we desire to have everybody understand that all of the engineers and officials connected with member companies really belong to the association, without any regard as to whether or not they may or may not be associate members, but associate membership, which only costs \$5 a year, is a purely individual membership and keeps every man in touch with the work, whether or not he belongs to a member company, or whether or not he might sever his connection with that company. I always enjoy very much being with the New York State Association. As I told your president this morning, when he spoke to me, and said he thought I was too busy to come, I hope the time will never come when I will be too busy to go to the State association meeting.

The meeting then adjourned until 2 o'clock.

Afternoon Session.

President Shannahan called the meeting to order at 2:30 o'clock, and the discussion on joints was resumed. Mr. A. H. Stanley (Public Service Corporation of New Jersey) being called upon, said he knew very little about joints, but wanted to know something about them. He said his company was building a great deal of track and the joints used were the Continuous rail joint on the Trilby 96-pound rails. That was used because they did not know of any other joint outside of the mechanical joint that they felt justified in using. Careful investigation had been made about the thermit joint, which has been used in a number of places, the electric welded joint and the cast-welded joint. Many hundreds of miles of track in New Jersey were laid with the cast-welded joint, and in almost every instance, he said, that joint has proved a failure, the effect of change of temperature of the rail and there were hollow spots in it, and after two or three years of life on brand new rail it had pounded very badly. They were having to replace practically every mile of track that was laid with the cast weld. He had seen many miles of track laid with the electric weld, and the managers and maintenance of way men were very enthusiastic about it, but after a year or two there was much less enthusiasm and the same thing seemed to be true with the thermit weld. He preferred at this time to use some mechanical joint which he knew would answer the purpose for a reasonable period and hoped, when it became necessary to remove that joint, that experience would have demonstrated which was the most advantageous joint to use, a welded joint or not a welded joint. Mr. Clark's joint appealed to him more than anything he had seen yet.

Mr. C. H. Clark referred to what Mr. Wilson said of the breakage of electrically welded joints, and said he had 12,221 joints welded electrically in 1904. There was a number of breaks. The practice in repair was to cut into the rail and weld the break. By making an extra large mold, a man with a little mechanical genius could dig the mold out to fit the break, and weld the break with thermit, right over the top of the bar; wherever the break was it could be welded with freedom and satisfaction.

Mr. C. G. Reel said the objection to the welded joint was not the feature of breaking, because as Mr. Clark said, breaks could be repaired. In new work he planned to use a thermit-welded joint to come up to the head of the rail from below, and omitted the end bolt hole. The first hole was 6 inches or 8 inches back from the end of the rail. What he wanted to know before he put this thermit joint in was whether the head of the rail was going to be injured by the excessive heat in close proximity to it while the weld was being made, and he wished some one who had had long time experience with welded joints would say whether a deterioration of those joints could be expected as time went on. He had put in cast welded joints as long back as twelve years ago, some of the first in the country, but did not remain with the railroad on which they were put in and did not know how they turned out. In five or six years the rails began to soften and go down at the joints, manifestly owing

to bad construction. He would like some information on long time welded joints, either cast-welded, electrically-welded, or thermit-welded.

Mr. Clark did not think the head of the rail was injured by the thermit process. The kind of bonds was an important question. He put in plug bonds, solid terminal. He had not used soldered bonds, because he did not believe in them. He had not been able to get a bond but what, tested at the end of the year, would be shown to be oxidized and leaking. He said he was now brazing the bond on the head of the rail, going through the whole system, and everywhere a leak appeared with a Conant tester, that bond was brazed to the head of the rail.

Mr. French, in answer to Mr. Reel as to the wear of the rail head, said that there apparently was not more wear at the weld than in the center of the rail, and if he remembered rightly, the thermit people guaranteed that the weld would not injure the rail in that respect.

Mr. P. N. Wilson (Rochester Ry. Co.) explained in relation to the electrical welds, that they were placed about 18 months ago, and he noticed no bad effects from the heat. The heat was so concentrated and applied in such a way that he did not think it affected the head of the rail at all; at least, there was no appearance of it affecting the head of the rail. In connection with Mr. T. W. Wilson's statement, in relation to the Philadelphia joint, he thought that in placing the zinc joint, there was as much machinery necessary as in an electric weld. It required a riveting machine, a machine which applied the zinc, a sand blast, and quite a number of other machines which were rather expensive. He could not see that any mechanical joint was as good as a welded joint. Any mechanical joint would unquestionably become loose in time, and the bond feature was a very important thing. One could not consider the joint without considering the bond. With a weld, there was unquestionably bonded track.

In answer to a question as to what he thought of a thermit weld in unpaved streets, Mr. French said he did not see any objection as long as the rail was kept covered so that the temperature could not affect it or cause breakage through contraction of the rail. Mr. Clark related that when the city of Cleveland got a little hotheaded and tore up tracks on Holton Road in Cleveland, the tracks were all electrically welded, 6-inch rail. They broke the rails in two on over 400 or 500 feet of track, and threw them in the gutter, and it was impossible to relay them. When an injunction had been obtained against the city and made permanent new rail was laid. Tom L. Johnson came to Mr. Clark and said: "There is one thing about it, you cannot weld that track." Mr. Clark replied that perhaps he had not seen the thermit weld. He said: "Even if you weld it, how will you keep it in line?" Mr. Clark welded the tracks and they lay out in the sun for about three or four weeks, in August. They were simply banked up with dirt and there was no trouble in keeping them in line. The hat he was wearing was paid for by Mr. Johnson.

Mr. Reel inquired whether, in the event of welded joints being put in an unpaved street, and later on in the course of time the street was paved, it would be safe to open up 100, 200 or 300 feet of the welded track without getting any buckling effect in the summer time. If the track should buckle, it would be a serious thing to get it back.

Mr. French suggested if anyone contemplated anything of that kind, he should make a record of the temperature when the rails were laid originally, and do the paving at the same temperature, or just a little below. A certain section at a time, not over 200 feet, could be uncovered and concreted and paved.

Mr. Jackson remembered one instance where he opened up at least 1,000 feet. It got out of line somewhat before it was closed in, but there was no great difficulty in getting it

back again. He thought to uncover a stretch of track 500 feet would be all right if it was held sidewise, by bracing it against the end of the ties that would hold the rail in line. Mr. LeGrand Brown knew of one case where 400 or 500 feet of electrically-welded track in Rochester was laid in the cold weather, and the next morning there were four or five joints broken back of the welded joint.

Mr. P. N. Wilson described a case of about 1,200 feet uncovered, but connected at both ends, in Philadelphia. It buckled very badly, the result being that the man in charge of the work covered it with canvas and sprinkled the canvas with water and the track came back to its original position. Mr. Brown had had a case similar to that. Mr. Clark had had that experience on a drawbridge. The viaduct was 2,800 feet, with T-rails laid on planks, and the rail curled on the planks. The sprinkler was put on it and the rail came back.

Derailing Devices.

"Derailing Devices" was a general discussion without paper. This was included at the suggestion of Mr. Barnes, of the state railroad commission. Neither Mr. Barnes nor Mr. Baker were able to be present.

Mr. Stanley, in opening the discussion, said that except in one or two instances, he only had the ordinary hand-derrail. The main line was opened, the conductor went ahead with the flag, and opened the switch by pulling the lever.

Mr. T. W. Wilson said he had a few places where the derail was interlocked with home and distance signals, operated in a tower on interurban lines. The main thing with reference to derailing switches was to have the apparatus thoroughly drained. He had any amount of derailing switches in use, but as a rule there had been no effort to drain the pipes through which the levers run and consequently the first thing in winter the trainmen disconnected and plugged them. He thought a derailing switch operated by the conductor was a very good thing, and a preventive of accidents in many cases. The derailing switch should be back a sufficient distance, so that if a car ran off the track it would not run into another car or into a steam railroad train. Mr. C. A. Coons (Int. Ry.) said most of their derails were 25 or 30 feet away from the steam railroad track. His idea of a derail was that it should be located 100 feet from the first rail, back far enough so that when the car left the track it would be impossible for it to reach the steam railroad track.

Mr. Clark said that the state of Ohio had a law that the derailing switch must not be further than 70 feet from the track nor closer than 40 feet. If the derailer was too far away, it caused a great deal of trouble. In connection with that, he had been contemplating trying a new derailer. With the Porter derailer, or any derailer, the conductor had to go over to the track, cross the track and pull the derailer. Sometimes he would be behind a string of cars, or behind a fence and he could not see. He said he had been contemplating putting a Cheatham electric switch in the track at the derailing point. The connections were such that whether the motorman had the power on or off, this switch would open up as he came to it. It did not make any difference whether he kept his power on or off, that switch was bound to open up by putting both terminals on the same point. Then he would make an order that the conductor must go ahead and stand on the track, not go across the track and get behind a string of cars, but stand on the track, and if a train was coming, just wait. In the meantime the motorman must get off the car and take a switchiron and throw the switch back before he could go ahead. That was suggested to him by one of his conductors.

The president said that offhand that was a great improvement over anything he had known of. The reason that the Board of Railroad Commissioners hoped this question would be taken up was that they had had a number of acci-

dents on railroad crossings, and in a number of instances on crossings supposed to be protected by some form of derailing device. These devices had been put in at the suggestion of the electrical expert of the board, and it was a great surprise, the commission admitted, that the accidents continued to occur at these very crossings. In the investigation it was found that the derailleurs had been frozen tight, or for other reasons had been disconnected and were out of order. It really seemed to the commission as though they might be a source of danger rather than a source of safety. It would seem to him that the device which Mr. Clark described would obviate the danger to great extent. Mr. Clark said its use put the conductor in a position where he had got to be hit by the train. He did not run across the track and get behind a string of cars, nor do anything mechanically. He had thirty of the devices and said they gave very little trouble. If the conductor should not go ahead and perform his duty, it did not take long to catch him.

Mr. P. N. Wilson thought the conductor would go ahead and pull the switch, but not look at the track. He would step down and pull up the switch, and there would be a mechanical operation; he might not go ahead of the car and look for the train. If the conductor went ahead and signaled for the motorman to go ahead, he would go, of course. It depended on the conductor looking for the train coming. The thing was to have some one go to the track and look for an approaching train, and some device to make him go there and look, but it appeared to him necessary to depend on a man in any event.

The president asked if it would not be possible to locate the switch so that the conductor would be obliged to throw it rather than the motorman. Mr. Clark replied that if that was done the conductor was made to do something more which was mechanical. The motorman was the man who would get hurt in the case of a collision. If the motorman got out of the vestibule, the car would be at a dead standstill, and he would see the train as well as the conductor. That placed the responsibility on two men. It occurred to Mr. W. J. Harvie (Utica & Mohawk Valley) that there might not be any objection to placing the lever on the derailing switch somewhat in the position of a dwarf signal which would either be between the tracks or close to the tracks, so that the conductor would have to know that the track was clear.

Mr. G. E. Eveleth (General Electric Co.) asked if it would not be possible to use an electrically controlled switch and have the switch control between the tracks so very close to the steam tracks that it would be necessary, with the derail closed, for the conductor to hold the control switch, so as to hold the derail closed until the car passed the derail. That was a suggestion of carrying out the idea of putting a man in a dangerous place and keeping him there. Mr. Clark believed the conductor should go ahead of the car. The orders were to get over the railroad crossings as quickly as possible after it was ascertained that the coast was clear. If the conductor was sent ahead and he had got to stand there and pull some device, it might not be possible for him to get out of the way. If he had nothing to do but look up and down the track and give a signal, he could take the car as it came across. His road had crossings of five and six tracks. For a conductor to run over that crossing, if the derailer was located on an average 60 feet from the tracks and the back of the car was 35 feet further distant, a total of 95 feet, with six or seven tracks to cross, the man had got to run 125 to 150 feet, and was awny over across the track where he could not always see everything that was on all the tracks. A derailer with a handle in the center of the track would freeze up more than the box that ran across the pavement with the chain.

Mr. P. N. Wilson thought that one bad feature of send-

ing the car ahead was that while the conductor was on the track, the car would be stopped and some one might try to get out. At that moment the conductor might signal to go ahead, and the motorman might not see the passenger. That was one bad feature. Mr. Clark said that all of the agreements with the steam railroads in Cleveland expressly stated that the conductor must go ahead of the car and signal to the motorman to advance. There were practically no accidents in the shape of people getting off the car at the moment of starting, because it was second nature for the motorman before he started to turn and look and see if any one was getting off. As a general rule, few people get off the car at steam railroad crossings. Mr. P. N. Wilson said he had had several rather serious accidents because the railroad crossing was situated at a station. There would be some passengers on the car who wanted to catch a train, and as soon as the car stopped they immediately jumped off, and in that connection there was considerable difficulty.

Rail Bonds.

A paper on "Rail Bonds," by Mr. H. L. Mack, superintendent of line, International Traction Company, was presented. It is given elsewhere.

Mr. Clark said he was discarding the use of bonds. His electrical engineer had recommended that all repair joints on lines that are carrying heavy current back to the power house should be repaired with the thermit weld on the bottom of the rail. In the last year all bonds and the rail have been coated with amalgam to keep the air out. He had concluded that was the best he could do with the terminal bond. He used the Brown bond, because most of the bonding was simply around the special work where the compressor could not be used.

Mr. Brown asked Mr. Matthews where they had the Brown plastic bond, whether they put them back again into the new joints. Mr. Matthews said the Brown plastic bonds mentioned were put on in 1896, and in 1903 he had occasion to move the track in order to widen the devil-strip. At that time he tested the joints and found there was no deterioration, except where the bolts became loose, the joints were loose and the plastic material had come out. The track was moved over and paved up again, and after it was paved up it was practically the same as before.

Mr. P. N. Wilson said he had used a special bond for the last five years. He took a copper plate $2\frac{1}{2}$ inches square and about $\frac{1}{2}$ -inch thick, with two grooves on one side and a smooth face on the other. There was a one-inch hole in the center of the plate. This plate was treated with flexible solder and alloy, and the wires were treated the same way. Two No. 0000 copper wires were fitted into the groove and an iron plate similar in size and appearance to the copper plate was bolted through the rail, clamped on to the two copper wires and made a bond completely around the plate. In some places where he could connect the wires under the plate he put them under the plate. It cost \$1.50 a joint, put on, for labor and material. A test made after five years' service showed that these bonds were equal to a solid section.

Mr. M. J. French had some experience with soldered bonds. In 1905 a small portion of the West Shore Railroad, between Frankfort Junction and Herkimer Junction, was electrified, and on his recommendation soldered joints were used. He used a bond of 500 circular mils capacity, and the bond was made up by ribbons running horizontally and riveted together. It was the Lord Electric Company type of bond. It developed that the freight traffic on the road was heavy and the shock from the heavily loaded freight cars was excessive, and the bonds worked loose because they were not flexible enough. These bonds were taken off and regular 10-inch compression bonds put on under the #14 plate. He thought if the bond in the first place had been more properly constructed with a terminal, having the wire coming from

it vertically, instead of horizontally, and perhaps a wire connection between the terminals, instead of the ribbons, they would have held a great deal better and perhaps have held perfectly. He had also used recently the American Steel & Wire Company's twin terminal bond, which appealed to him more strongly than the old fashioned compression bond. In applying two half-inch holes were drilled into the back side of the ball of the rail, and a reamer inserted in the hole that made a slight channel near the entrance to the hole. The terminal of the bond was inserted into the hole and driven up with a hammer until it struck the end of the hole drilled, and compressed and filled out the little channel, and in that way the bond was thoroughly anchored in the hole. In a test it showed a conductivity equal to that of a soldered bond of the same capacity. He thought this bond really beat the compression bond, except for the fact that it must be placed on the outside of the rail.

Mr. E. E. Hawkins (Ogdensburg Street Railway) said that in open track work the bonds were frequently stolen. In open track work he used an open copper wire bond, placed outside of the fishplate. Mr. Charles H. Wilson (Toronto & York Radial Railway Co.) said that in Toronto, on the suburban line, they used twin terminal bonds similar to the one Mr. French spoke of, and to do away with the chances of the bonds being stolen, they made a mixture of oil and lamp black, with shellac in it, and gave them a coat of this mixture as soon as finished. He had about thirty miles of road with that bond, and had not yet had any stolen. Junkmen, traveling continually up and down the line stole the trolley wire, but not the bond wire.

Overhead Lines.

Mr. G. E. Eveleth (General Electric Company), next read a paper on "Span and Catenary Construction," which will be found on another page of this issue.

The last paper on the programme, "Center Pole Construction," was to have been presented by Mr. F. A. Bagg (Fonda Jonstown & Gloversville), but Mr. Bagg said that after he had prepared a paper he found it was more of an argument in favor of span construction than center pole construction, and as there was a paper on span construction he thought it would be useless to give his paper. His principal objection to center pole construction was in the matter of supporting the trolley wire with the bracket arm. It was not as flexible as the rest of the trolley wire, and especially on high-speed service there was a jumping of the wheel which might derail the wheel, and besides there was always sparking at the ear. That would hit the wire, and in time cause a failure. He objected to seeing poles in the devil-strip between the tracks; it always appeared dangerous. Though generally considered that center pole construction presents a fine appearance, he would rather have the poles out of the way. There was a saving in the grading and in the ballasting in span construction over the center pole construction, because the roadbed could be narrowed about two feet; in other words, with center pole construction the tracks were placed about 15 feet, center to center. With span construction the tracks could be 11 feet center to center. In the maintenance of way, that was quite a consideration. He said there was also less labor required to maintain the roadbed, keeping it clean and dressing it up; it had better drainage. That would show in a better track surface, less labor required to maintain the track in a given line of surface. He thought the span construction will cost more per mile than center pole work, but considering also the grading and the ballasting, the figures would be in favor of span construction. He did not consider at all the catenary work that had just been explained. That, of course, imposed another consideration, and might be controlling, but his observation was that both span and center pole construction were used indiscriminately in the same territory, and even on lines of the same company. It seemed as though there were no particular advantage in one system

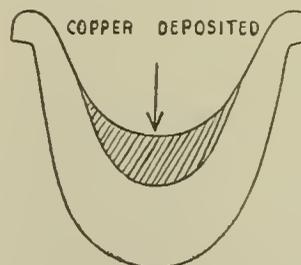

over another; that is, it apparently was not known there was any particular advantage, but he believed there was. He thought time and experience would prove that one was better than the other, and one system would become obsolete. He believed the span construction would survive.

Mr. A. B. Meyers asked Mr. Eveleth if he considered 15 feet the minimum distance between hangers on the catenary construction for the use of the wheel. Mr. Eveleth replied that there was nothing to limit the distance between the points. On the road from Atlantic City to Semers Point, they had been running with a distance of 80 feet between points, and the assumption was at the present time that a distance of 50 feet between points would be close enough for wheel collector work. It was possible to get the distance between stations even less than 50 feet for the wheel. Less than 15 feet would make the whole system rather more rigid and would be getting to a point where very little value would be obtained for the additional expense. Mr. Reel asked if it would not be feasible and desirable to apply the catenary system to span construction; instead of carrying the catenary on center poles, which has certain disadvantages, as Mr. Bagg pointed out, to carry the catenary on span construction and save the width in the roadbed and get all the advantages of the catenary construction, which were so self-evident.

Mr. Eveleth said that a number of roads operated in that way, and the only requirement different from ordinary catenary construction, or cross suspension, was the additional weight of the messenger wire to be carried, and it was advisable to allow a little mere dip between the point of support on cross suspension and the connection between the messenger wire, than in ordinary cross suspension. The thing as entirely possible. The operation of such a condition he had watched on one line in particular had been very satisfactory. That line was operated with the wheel trolley, and he never saw the wheel go off the wire, and from what he could obtain from the various operators, they had never seen the wheel leave the wire on a tangent track.

Mr. J. H. Pardee (Canandaigua) said there was one question he would like to bring up for information. He used No. 0000 trolley wire, and was having a number of breaks on that trolley wire about one inch inside the end of the splicing sleeve. There had been five or six breaks in the last few months, and every time the wire was broken it was about one inch inside the sleeve. The sleeve was soldered. Mr. Clark said the damage was done in soldering the sleeve; he should use a mechanical sleeve. Mr. Mack thought it was probably due to overheating the wire.

Mr. W. R. W. Griffin (Canandaigua) exhibited a sample trolley wheel, in which most of the copper, which should be on the trolley wire, was on the wheel. The wheel was a 7-inch wheel with a collector contact of $2\frac{1}{4}$ inches. The ordinary Kalamazoo wheel is $1\frac{3}{4}$ inches. He had increased the size to get a good contact for current collection. That wheel was put on a two-car train, with a busbar, carrying eight motors. The other wheels bored at the same time were placed on single cars of four motors, 75 hp. and all the wheels were worn out and

Section of Trolley Wheel with Deposit of Copper.

made from 5,000 to 6,000 miles. That wheel had increased in size over 5-16 inch all the way around in 1,725 miles. The schedule speed was 24 miles per hour. Mr. Sheehan said there was only one remedy he knew of, to run cars faster. He had the trouble with the slow-running, it collected copper on the trolley wheel. He thought it was due to the amperage and the running slow.

This concluded the discussion.

The president announced that Mr. Charles R. Barnes, of the railroad commission, had sent a telegram that Commissioner Baker was at home ill and sent his regrets.

Mr. Wilson, on behalf of the International Railway Company, extended an invitation to all the members who desired to inspect their shops.

Mr. F. A. Bagg moved that a hearty vote of thanks be extended to Mr. H. J. Pierce, Mr. T. W. Wilson, and the other officers of the International Railway Company for the courtesies extended at the meeting.

The meeting then adjourned.

TRACK CONSTRUCTION IN PAVED STREETS.*

BY I. E. MATTHEWS, ROCHESTER RAILWAY COMPANY.

An absolutely "permanent way" is a dream which will never be realized, but is the ideal condition toward which we aim. The increasing weight of rolling stock has been met by altering the sections of the rail from the flat-strap to the girder and gradually increasing the weight and depth of the rail; thus affecting the depth of foundations and increasing the cost.

Joints are one of the greatest sources of trouble to the maintenance of way engineer. Owing to the difficulty of removing the paving, many slight defects in joints are neglected until it is absolutely necessary to make repairs, and then the cost is much greater than it would have been if repairs had been made at the first indication of trouble. This condition of affairs leads to a considerable amount of rough track, not quite bad enough to warrant ripping up the pavement, and yet by no means a track in first-class condition. It is, therefore, imperative that the joints be as substantial and durable as the rail itself. In order to eliminate joints, it is now customary to use rails 60 feet in length, and if the idea be indefinitely extended we obtain a continuous rail. This is accomplished to some extent by the electric or cast-welding of the rail ends; but as this is the subject of another paper I will not consider this matter further at this time. The question of joints, tie-plates and bonds have also been made subjects for special papers.

Smooth track to true gauge is an essential feature to electric roads. Wooden ties spaced 24 to 30 inches, center to center, and laid in or on concrete foundations probably give the best support to track. It has generally been advocated that the rail should have an elastic support, such as the wooden tie affords, but more recent practice would seem to indicate that the metal tie thoroughly embedded in concrete would be an improvement on the older method. In keeping the track to gauge the braced tie-plate is preferable to the tie-rod.

Passing from these general remarks, we may consider some of the variations in construction. Obviously the selection of the proper track construction for any given street will depend, as indeed does the pavement itself, on the class of traffic which will use it. For a street of heavy traffic, one would expect to use stone blocks for paving material with a corresponding heavy track construction. Where traffic is light, brick or asphalt might be selected as paving and a lighter track construction would be used. In either case, a concrete foundation at least six inches in thickness under the ties is recommended. This is costly, but necessary to good permanent track construction. Where the foundation is quite solid and has never been disturbed by gas or water pipe trenches, sewers or other excavations—a condition rarely, if ever, found in our modern cities—this concrete foundation might be replaced by broken stone or gravel with fairly good results.

Under the concrete foundations and about one foot outside of the outside rails there should be laid a three-inch farm-tie drain in coarse gravel with joints covered with gunny cloth, to be laid parallel with and the full length of the track, connecting with surface sewers or manholes. It should be at least two feet six inches below the grade of the finished pavement and covered with coarse gravel for a width of six inches and up to the bottom of the concrete foundation under the pavement. The subgrade should be crowned so as to render the drain more effective.

Track Construction in Rochester, N. Y.

The type of construction best adapted to streets of heavy traffic is the nine-inch full grooved rail, well tied with Geor-

gia pine ties spaced 24 to 30 inches center to center and laid on a six-inch concrete base. The concrete should be mixed—Portland cement one part, sand three parts, and broken stone which will pass through a two-inch diameter ring, six parts. This concrete should be laid at the same time as that for the foundation of the adjoining pavement and should be carefully tamped under the ties and rails. A fine concrete or grout of one part of Portland cement to two parts sand should be poured around and under the rail in order to give a firm and uniform bearing to the rail. The space between the flange and head of the rail should be filled with a Portland cement mortar in the proportion of one to three. The stone blocks resting on six inches of concrete and with joints thoroughly grouted, complete this construction. It is the type used by the Rochester Railway Company on streets of heavy traffic, the paving blocks being of Medina sandstone. The cost of the construction has averaged \$5.80 per lineal foot of track. Using the same track construction, but with brick paving, the cost has been \$5.00 per lineal foot of track.

In recently rebuilding the University avenue line of the Rochester Railway Company, we adopted a concrete-beam construction under the rails. The beam is 12 inches in depth below the base of rail and is 18 inches wide under the outside rails, and 14 inches wide under the center rails. Wooden ties are spaced five feet center to center; the beam being carried to a depth of eight inches under the ties. Ninety-four-pound nine-inch girder rails held to gauge by braced tie-plates at each tie rest solidly on the continuous concrete beams. The pavement between the tracks and two feet outside is of Medina block, the paving in the street beyond being asphalt. This construction costs \$5.06 per lineal foot of track. University avenue is an outside street and would not be classified as one with heavy traffic; however, by using the concrete beam we were able to obtain a stone block pavement at about the same cost as the brick pavement with solid concrete foundation. One point should be emphasized—to render the continuous concrete-beam construction satisfactory, the concrete foundations of the track and pavement should be thoroughly bonded together. If the subgrade has been disturbed and there is any possibility of future settlement taking place, I should hesitate to use the concrete beams.

Use of T-Rail.

I am of the opinion that a material reduction in the cost without lowering the standard of construction from that given above, can be effected by the use of the high T-rail in paved streets.

The municipal authorities to a large extent seem to be opposed to the growing use of T-rail in paved streets, but there are now upon the market paving bricks of such shape that the paving around the rail gives practically the same effect as the groove in the girder rail and in many western cities this type has become the standard. It is claimed that the groove or flange-way so formed is superior to the grooved girder rail. In streets of heavy vehicle traffic the cost of maintenance of the paving might become excessive with T-rail, but on all other streets I am of the opinion that the T-rail would be preferable to the grooved rail, both because it is cheaper in first cost and because it gives the bearing of the wheel squarely over the center of the base. The base being wide, there is no tendency to over-turn and the flange-way formed by the special paving blocks gives a groove which is self-cleaning as that of the grooved rail. Another consideration which should receive attention is the increasing number of interurban cars which are entering our cities with their greater depth of wheel flange. Very little wear can take place on the ordinary grooved or girder rail before the cars are running on the wheel flanges. With the T-rail, however, the amount of wear that can take place before the track is entirely worn out is independent of the car-wheel flanges.

The Street Railway Journal of June 3, 1905, discussed, editorially, the persistency with which city engineers in certain municipalities cling to the idea that the grooved rail is the only suitable rail for paved streets, and then advanced the idea that the grooved rail was dangerous to interurban cars, citing some examples from Cleveland where serious derailments had occurred due to the grooves in the rails not being deep enough to admit the flanges of the interurban wheels.

Wherever T-rail in paved streets has been given a fair trial it has been notably successful. I believe the honor of the first use of T-rail in paved streets belongs to Denver, Colo. They use a 72-pound 6-inch shanghai T-rail laid on wooden ties only 21 inches between centers, tamped with gravel. Extreme care is taken, however, to have the ground thoroughly settled before placing the ballast. Other cities in which T-rail construction in paved streets has been adopted to a large extent, are Indianapolis, Milwaukee, Minneapolis and St. Paul—the two latter cities being notable because

*Paper presented at the quarterly meeting of the Street Railway Association of the State of New York, Buffalo, January 11, 1907.

it was there that T-rail was first used in streets paved with asphalt, where girder rail had been the rule before. The rail used is an eight-inch shanghai T, weighing 79 pounds to the yard. A concrete beam supports each rail and is 22 to 24 inches wide and 12 inches deep under the rail. Around and above the base of the rail is placed three inches of natural cement, if the paving is of brick, and less if the paving is of granite.

The most notable instance of recent adoption of T-rail construction in the east was in Boston some two years ago when they installed about 25 miles, following closely the practice of Minneapolis. As the writer has not built any T-rail track in paved streets, he is not in position to present any figures as to actual costs. Mr. John A. Beeler, who, I believe, designed the first shanghai rails, made some estimates of track construction which are given in "Herrick's Electric Railway Hand-Book," in which he states that stone block paving on concrete base with 70-pound T-rail, track on wooden ties 21 inches between centers and ballasted with gravel costs \$4.43 per lineal foot of track. Using the same track construction and paving, but with a six-inch concrete foundation, the cost is stated at \$4.90 per lineal foot of track. This is 90 cents per foot of track less than the cost of the same type with girder rails in the city of Rochester. The difference between track on gravel ballast and concrete base as shown above is only 47 cents per lineal foot of track. This additional 10 per cent of cost would insure a more serviceable and durable construction and in the end give the best satisfaction.

In conclusion, I would suggest the high T-rail with wooden ties on a concrete base, or steel ties on the concrete stringers as the ideal track construction in paved streets; excepting, however, in streets of heavy traffic where the grooved girder rail would be superior on account of the better protection afforded to the pavement adjacent to the rail.

CONCRETE STRINGERS, CONCRETE STRINGERS WITH TIES, AND STEEL TIES.*

BY F. D. JACKSON, ENGINEER OF WAY, INTERNATIONAL RAILWAY COMPANY, BUFFALO.

In two very able articles of Mr. T. W. Wilson appearing in the Street Railway Review, issues of March and August, also in the Street Railway Journal of October, 1903, "Standard Practice in City Track Construction" and "Track Construction and Maintenance in Buffalo," a very complete description was given of the Buffalo track system.

The present article is to treat, not of the various styles of construction, but of two distinct types, i. e., concrete stringers with and without ties, and solid concrete in the track.

Realizing, as we do, the necessity for providing a suitable and substantial substructure for roadbeds in electric railway work in order to take care of the increasing weights of cars, which to date are 30-ton, work today is in the direction of providing a foundation for the rails which shall be as nearly rigid as possible. Many engineers question the advisability of so rigid a construction, claiming undue wear to the rails, due to the inelasticity of the roadbed. Measurements of rails on a one-half minute line do not bear out this statement. We find that the head of the rail has worn $\frac{1}{8}$ -inch in about $4\frac{1}{2}$ years, which would give the rail a life, under this very frequent service, of more than 16 years, before the $\frac{3}{4}$ -inch flanges would commence to touch the bottom of the groove.

There is also a very important thing to consider, namely, the life of the pavement adjoining rails in city streets which is prolonged by rigid track construction, as is maintenance very considerably cut down. It is true that the elasticity of roadbed favors the life of rail and the desirability of either construction will be eventually determined by the comparative cost of renewing rails more frequently, the pavements remaining in good condition, or paving oftener during a longer life of the rails.

Concrete Substructure.

Buffalo has carried the concrete stringer idea further than most roads, by making one solid bed of concrete the entire width of roadbed 6 inches deep and 6 inches under the ties, instead of a concrete beam under each rail. This style of construction is used in stone-paved track. On the other hand in asphalt-paved track, we have gone to the other extreme and placed a concrete beam 12 inches wide by 8 inches deep under each rail and not bonded to the concrete

which forms the paving foundation. Thus the track is supported by no concrete except that under each rail.

The solid concrete construction with stone paving has been adopted as our best style of work, and the following data will show to what extent it has been used:

Of the 194 miles of city tracks, 62 miles are of the concrete-beam construction, and 87 miles of the solid-concrete construction, the remaining 45 miles being old-style work and mostly on lightly traveled lines, where sand, gravel or stone are used for ballast.

Two streets have concrete-beam construction without ties, Clinton, Bailey avenue to city lines, 5,300 feet, double-track, and Jefferson street, Dexter to Main, 2,998 feet double-track. In each case the rail is 9 inches 94-204; standard 12-bolt joint; tie-rods at 8-foot and 5-foot centers; toothing and asphalt; built in 1897. Today these two pieces of track are in fair condition. On Clinton street 16-foot single-truck cars are run on 10-minute headway. No repairs have been made to the track. On Jefferson street double-truck cars are run on 5-minute headway. Repairs on portions of this track have been made.

One reason why this style of track has held so well is due to the rails being suspended, put in good surface and line, then concrete tamped well up against their bases. The remaining 59 miles of concrete-beam is with tie construction, with both 9-inch and $6\frac{1}{4}$ -inch girder rail; steel channels 7 inches by 5 feet 9 inches and yellow pine ties 5 inches by 7 inches by 7 feet at 10-foot centers. With the steel channels no tie-rods were used, and with wooden ties, tie-rods were placed at 10-foot centers and brace tie-plates were used. Most of the track was built in 1899. With this style of construction the rail gets out of surface and line, affecting both pavement and rolling stock.

Of the 87 miles of solid concrete construction there are several notable features. Nearly all this rail is 9-inch girder mostly welded, and some standard 12-bolt joints. There are only 2.2 miles of $6\frac{1}{4}$ -inch rail. Most of the welding was done in 1899 and 1900. Yellow pine 5 inches by 7-inch by 7-foot ties at 5-foot and 10-foot centers; tie rods at 10-foot centers and in a few cases brace tie-plates at 6-foot centers; various kinds of paving, as common stone, a little brick; but mostly No. 1 block stone. Some of this track was laid in 1893. The average shows that the track was laid in 1900.

Track Laying with Steel Ties.

The construction we consider most up to date is solid concrete with Carnegie steel ties, and tie-rods at 5-foot cen-

Track Construction with Nine-Inch Rails, Carnegie Steel Ties and Tie-Rods at Five-Foot Centers.

ters. This style of construction was put in this past year on Fillmore avenue, 5 miles of double track, and on Sycamore Street, 1.1 miles of double track. A trench was dug 15 inches below the surface of the street and 18 feet wide. Nine-inch rail was laid and bolted with four bolts and clips, to Carnegie steel ties spaced on 10-foot centers. These ties are of I-beam section, top flange, $4\frac{1}{2}$ inches; bottom flange, 8 inches; depth, $5\frac{1}{2}$ inches; 6 feet long and weighing 19.7

*Paper presented at the quarterly meeting of the Street Railway Association of the state of New York, at Buffalo, January, 11, 1907.

pounds per foot. The track was then surfaced and lined by blocking up under the ends of ties and $\frac{3}{8}$ -inch tie-rods spaced at 5-foot centers were put in. A 6-inch trench was dug under each tie. Concrete, proportioned 1 part of Lehigh Portland cement, 3 parts of clean, sharp sand and 5 parts of $2\frac{1}{2}$ -inch stone, was then put in by a Foote continuous concrete mixer. This mixer was of traction type, one pair of wheels running on the outside asphalt, the other pair of

Track Construction with Nine-Inch Rails, Carnegie Steel Ties and Tie-Rods at Five-Foot Centers.

wheel on 5-foot planks properly blocked up so that no weight was brought upon the track. The concrete was shoveled into the trench to a depth of 6 inches, well tamped under the rail and thoroughly pounded after being leveled to the top of the ties. Three ties were kept tamped ahead of the mixer to insure thorough work at the ties. Four hundred feet of single track were concreted per day of 10 hours, which includes besides in the track, 2 feet on the outside and 2 feet in the devil strip. By the use of the continuous concrete mixer a uniform mix was made on the entire job with a saving of about 10 per cent of cement. The pavers followed behind the concrete gang, using 3 inches of coarse gravel for a cushion and on that the No. 1 Medina block stone was placed; full stone paving was placed between the rails and in the devil strip, and tooling along the outside of track (to receive the asphalt) and up against it. This stone paving was then pounded and slushed with a grout composed of a mixture of 1 part Portland cement to 2 parts of sand, which completely filled up the voids between the stones, making a perfect bond. This style of construction costs about \$5.00 a running foot of single track as against \$1.50 where wooden ties and tie-rods at 10-foot centers are used. Part of this increase in cost is due, not only to extra cost of the steel tie over wood, and to an extra tie-rod, but also to the higher price of labor and material.

Where it is necessary to keep cars moving over a stretch, where track is being reconstructed, portable crossovers are used and cars are kept off the new work for at least 72 hours to allow the cement to set. Special care should be taken to see that concrete is thoroughly tamped under and around the ties and under the rails, following this up by thorough pounding.

The fact that we have considerable track with the concrete beam under each rail laid since 1897, and more of the solid concrete style laid at a later date, has given us a chance to make a just comparison between the two styles of construction. That we have so much solid concrete construction is proof of which style of work we find the best.

In Lockport, on Main street we have 4,217 feet of single track of 100-pound A S C E section T-rail on solid concrete in a brick paved street using a special brick along the groove side of the rail. Over this track three styles of wheels are run, namely, wheels with 2-inch tread, $\frac{5}{8}$ -inch flange, $2\frac{1}{2}$ -inch tread, $\frac{3}{8}$ -inch flange and M. C. B. wheels. Over this track 100,000-pound gondola cars are run. This track was constructed in 1903 and to date is standing up perfectly.

THERMIT RAIL-WELDING.*

BY M. J. FRENCH, UTICA & MOHAWK VALLEY RAILWAY COMPANY.

In all branches of electric railway work there are knotty problems to be solved, and in the track construction department surely no subject has called for more careful study and received more serious consideration than that of the maintenance of rail joints. Manufacturers and track engineers alike have put forth their best efforts in the endeavor to solve this problem.

The hardest proposition with which manufacturers of improved rail joint fastenings have to contend is to secure fair play for their devices. Many fastenings have features that mark a material advance over the old style of joint plates but their application requires such care that its neglect would make the joints appear less desirable than those of older date, especially when the extra cost and consequent additional loss through failure is given due weight. All track engineers and superintendents concede the great advantage of a continuous rail, but the attempts to secure it have in some cases been so expensive and unsatisfactory that others have hesitated to recommend to their superiors the use of the latest and most scientific appliances.

Thermit, electric and cast-welded joints all have their partisans among track engineers, who have given study and especial care in the application of one particular type of weld. No one disputes the statement that all three methods have been successfully employed, but it likewise must be admitted that there have been some failures, and in some instances that money loss has resulted in the abandonment rather than in a more careful mechanical application of the process.

On the Utica & Mohawk Valley Railway Company's system we have used only the thermit process of welding, but know that others have had such marked success with electric and cast welding that we cannot take exception to their practice. Granted that we have had failures, we must also admit that, save in one particular, the fault is attributable either to carelessness in application or to lack of knowledge of requirements. This is proven by results obtained this year in applying the knowledge gained through failure last year.

Details of the Thermit Process.

Although the details of the thermit welding process are familiar to track engineers generally, a brief description may help others to appreciate its advantages more fully. The process consists in pouring molten iron, or more correctly mild steel, from a crucible into sand and flour molds placed around the rails at the joint. The rails having first been flared and surfaced, the joint is thoroughly cleaned with a sand blast or wire brush. Then the rails are heated by gas-oline or oil blow-torch to expel all moisture, and by heating the rails to a dull red better results are insured, as the temperature of the molten steel is not reduced as much when coming into contact with the rails.

A pair of molds made of an equal mixture of common clay and sand, or more preferably of sand and 10 per cent of cheap rye flour, is then clamped firmly to the rails. The material of the molds is held by wrought-iron framework provided with handles to facilitate carrying. The rail head is then painted with a watery solution of common red clay which the heated rail immediately dries up to a thin coating. This is to prevent the molten slag or steel from unlinging with or burning the rail-head. After thoroughly luting all joints of the molds with clay of the consistency of putty, common earth is packed around the outside of the molds. The molds and rails are then given a final warming with the blow torch, the flame being directed inside the molds to expel any remaining moisture. The crucible on its tripod is placed with pouring hole directly over and about two inches above the gate in the mold. After placing the tapping pin, iron disc, asbestos disc and refractory sand in the bottom of the crucible to act as a plug for the opening, the thermit compound is poured in and in the center of the top is placed about one-third of a teaspoon of ignition powder. A storm match starts the chemical process.

The chemical reaction is a great mystery to the curious bystanders, and a foreman might spend all of his time answering questions. The thermit compound is composed of aluminum and iron oxide, both in granular or flake form; the ignition powder is composed of aluminum and barium peroxide in much finer form. When the match is applied the barium peroxide ignites and releases its oxygen to the aluminum very quickly. The heat produced is so in-

*Paper presented at the quarterly meeting of the Street Railway Association of the State of New York, Buffalo, January 11, 1907.

tense that it causes the iron oxide to release its oxygen, which in turn is seized by the aluminum and almost instantly the entire contents of the crucible are a boiling and seething mass. By this reaction the pure steel is liberated and settles immediately to the bottom of the crucible. This wonderful chemical action is concluded within 30 seconds, the crucible is tapped by striking the tapping pin with a special iron spade, and the incandescent steel runs smoothly into the mold, the aluminum oxide or corundum slag following. In five minutes the mold can be removed for the passage of cars.

Some Improvements.

To go back to the beginning of the operations, our attempts to make molds of half proportions of clay and sand

Thermit Rail Welding—Welded Compromise Joint.

resulted unsatisfactorily in that they shrunk and checked badly in baking and required a great amount of careful luting to fill all irregularities at the joints. Also the clay was baked like a brick from the great heat of the welded joint and was quite hard to remove, adding somewhat to the expense.

An old foundryman suggested to our foreman that he should try a mixture of clean, sharp sand with 10 per cent of coarse rye flour, moistening the mixture sufficiently to retain its form when pressed in the hand. This mixture came away from the mold without adhering, baked without shrinking a particle, and was hard enough to stand ordinary handling. I believe we were the first users of thermit to employ this mixture that has now become general. For baking the molds we have found that a moderate heat of about the temperature required in baking bread proved most satisfactory, as a higher temperature burned the rye flour and destroyed its cementing property.

By adding a teaspoon of turpentine for each pair of molds the material was made as hard as concrete—unnecessarily hard for ordinary use but most desirable for special molds for broken or combination joints. These special molds we make solid and then with cold chisel and file hollow out the space to form a welt of iron.

We first tried baking the molds in a furnace with banked fire under a boiler, but the heat could not be regulated sufficiently and we lost many molds through burning. Our foreman then built an oven out at our Utica Park storeyard, using old bricks and building in a flat plate of iron above the firebox to baffle the heat. Above that two racks were placed to hold the molds. This oven has a capacity of 12 sets of molds, one man receiving 15 cents an hour making and baking 12 sets in five hours. Thus we have a capacity of 24 sets per day at a cost of 6¼ cents a set for labor. Our molds actually cost about 10 cents a set, as the workman was not constantly employed and we did not require the full output each day.

Our oven is constructed with but one door for the molds and fuel, but it is more desirable to have a separate door on the side of the baking chamber, as the oven is not then cooled off when fuel is placed in the firebox. We use old ties for fuel.

We have made our crucibles since using up the first six furnished by the Goldschmidt Thermit Company. We buy the magnesia tar and mix with it 25 per cent of old crucible

material finely powdered. These crucibles are very durable and last on an average for about 30 joints. We bake these in our oven with a higher temperature than that required for the molds.

Results with Welding.

We have welded about 900 joints during the years 1905 and 1906. Of these 600 were made in 1905 on Lorain 95-pound, 297 9-inch tram-head rail. This work was subsequently paved in with vitrified blocks on concrete extending from the bottom of ties. The ties were 6 by 8-inch hewed Southern pine, 8 feet long, spaced 24 inches center to center on 8 inches of crushed stone. Ten of these joints proved faulty during the year, the break being generally elliptical in shape and extending from the end of the rail just underneath the head and above the weld, to the upper bolt hole; thence to the lower bolt hole and back to the base of rail near its end. This break is supposed to follow closely the line defining the extreme limit of recrystallization of the rail that is produced as a result of the heat radiated from the weld itself. These rails had been drilled with 1¼-inch holes, spaced 2½ inches—6 inches—6 inches in upper row and 3½ inches—6 inches—6 inches in lower row, for regular ribbed-girder joint-plates, and the line of recrystallization passed through the first holes in most instances. I understand that this recrystallization is the cause of most of the breaks in both cast and electrically-welded rails. Nearly all of these joints that failed broke through contraction of the rails due to failure to protect them properly after welding continuously 500 to 600 feet of rail. Later we omitted the weld at every sixth joint until after the paving was finished on all joints but those left for contraction, when the latter were welded and the concreting and paving around them was finished. Thin sections sawed from the upper half of a rail were placed in the openings before welding.

Another kind of joint failure developed in the form of a slip joint, due to the iron of the weld failing to unite properly with the rail itself. We had about four of these slip joints during 1905. Later on we tested all welds immediately after cooling by striking them on both sides of the rail with a heavy spike maul, the laborer being instructed to break off the weld if possible. These defective joints were all repaired by making a special mold to enclose the old weld and by running another weld close against and at one side of the old one, over the break in the rail. This year we have had seven breaks in this total of 600 joints, all of them breaking through the bolt holes.

During 1906 we welded 200 joints on the same section of rail laid in 1902, where the 12-bolt, ribbed plates had begun to show failure through working loose or the rail head had mashed down at the receiving end. In the latter case the receiving rail was shimmed up and after welding the head was ground true to a straight edge by means of a hand-power emery wheel grinder. Thus far but one of these joints has proven defective, as there was no expansion or

Thermit Rail Welding—Joint Weld with Cable Bond.

contraction noticeable, the pavement being removed only at the joints.

We have also welded during 1906 about 100 joints on Pennsylvania Steel Company's section 95-272, a T-rail 7 inches high with 6-inch base and head 3 inches wide. We ordered this rail with the first bolt hole omitted. Thus the distance from end of rail to nearest bolt hole is 6 inches, and as the line change of crystallization fell several inches short of the holes we have experienced no trouble from the breaks except in two instances where long sections were left uncovered along the outside rail, awaiting paving. After

this we banked earth against the rail on long sections without expansion joints.

Some Precautions.

When we began welding this 7-inch rail we found that we could sledge off the welds and that the iron from the thermit compound had not united with the rail; also that the iron came up to the top of the rail head. We subsequently found that the mold models had become mixed, and we had used one of two small horizontal cross-section, and consequently the rail chilled the small volume of molten iron coming in contact with it. Upon enlarging the mold model so that the thermit portion furnished only enough iron to come up under the rail head, we obtained welds that resisted the most vigorous sledgeing that could be given with a 10-pound hammer. We were able to batter the weld out of shape, but could not separate it from the rail. This sledgeing test is now applied to all welds.

We found when welding in the morning with rising temperature that tightly-closed joints often humped up when welded. This proved to be due to the latent compression in the rails that did not manifest itself until the rail ends became soft. These humped joints were ground down with an emery wheel grinder. We had only a few of these joints when we realized the cause, and readily prevented such action by welding on cooler days or when the temperature was falling. We obtained the best results with joints open about one-sixteenth to one-thirty-second inch, the expansion in welding closing tightly such an opening. We have made excellent combination welds between 80-pound T-rail, 7-inch 70-pound and 95-pound T-rails and 9-inch girder rails. In making combination welds we found that it was essential to get a good body of metal between the upper side of the base of the deeper rail and the under side of the shallower section in order to secure the strongest type of weld.

Thus far there has been no appreciable excess wear in the head of the rails at the welds and the heated portion seems to take the original temper, as it cools down slowly in about the same way as when coming from the rolls.

A few portions of thermit, not over six, have been lost through failure of the workman to tap the crucible properly, or lack of luting around the joints of the molds. We have had but one explosion during our entire experience. That occurred after using the process 18 months, and was caused through carelessness in welding on a rainy day and in not thoroughly luting the molds near the top. The slag came in contact with the wet earth around the mold, but aside from the scare occasioned by the report and a slight burn on the foreman's arm from flying slag no harm was done, and the weld turned out to be a good one.

Cost of Thermit Joints.

The total cost per joint to weld the 9-inch girder rail on the 1906 construction, including all labor, materials, tools and patterns incident to the work, experimenting with mold

Thermit Rail Welding—View of Completed Joint.

materials and cost of oven, was \$5.86. The total cost of welding old 9-inch girder work, including the removal of brick pavement and concrete at the joints and replacing the same, was \$7.44 per joint. The total cost of welding the 7-inch T-rail during 1906 was \$5.81 per joint.

Our track construction work has not been of such magnitude as to require continuous welding day after day, and we have used three men from a regular track gang for this work. In consequence the cost has not been so low as

would have been the case under continuous operation. We have never exceeded 20 welds in any one day.

We tried welding at night for a short time, but on account of increased expense and liability of accident gave it up, as there was no real necessity for doing it at night so far as the operation of cars was concerned. The comparative simplicity and small cost of the outfit required, the facility of manipulation and the flexibility of the process in its application to various sections of rails and to other welding purposes serves in our opinion to make it altogether desirable.

Welding Truck Frames and Cross Bonds.

Besides the regular rail welding we have successfully welded a broken side frame of a Brill 27-F truck at a cost

Thermit Rail Welding—Tapping a Cupola.

of \$6.85. This new part would have cost \$30, and the master mechanic considers the frame as serviceable as a new one. As the truck was not taken apart to do the welding, the advantages and economy of the thermit for this kind of work must appeal strongly to the economical mechanical engineer.

We have made a practice of welding in 500,000-circular mil copper cable cross-bonds spaced about 1,000 feet apart, and have met with signal success. As a matter of economy we have used a joint weld at one end of the cross-bond by boring a hole through the mold and inserting the cable opened to receive the projection of the rail base. The other end of the cable was welded opposite the joint by using a regular mold and one-fifth of a portion of the thermit at a cost of about \$1.25.

We feel that our experience and the signal improvement of 1906 over the welding done in 1905 warrants us in continuing the use of the process. If our breakage does not exceed 2 per cent a year, assuming the life of the rail to be 15 years, we shall have expended about \$2.25 per joint in paved streets in maintaining perfect stability and practically full electrical conductivity of the rails. Moreover, we have every reason to expect that the failures will materially decrease, as the weak joints should show themselves within the first year of service. We are also confident of reducing the breakage and loss of welding portions at the time of welding because of the experience gained by our men.

A preservative process for wood intended for the interior finish of buildings, railway cars, etc., and for furniture, etc., has been invented by a Mr. Horak, and is in use at his factory in Klosterneuburg, near Vienna, Austria. The process is applied to green timber, the preservative fluid being forced in under hydraulic pressure. The same fluid is also used to give the wood any desired color, and when the wood is dried it can be sawed and turned for manufacture. It is claimed that by this treatment all interior painting may be avoided, the colored wood being simply polished or varnished. It is further claimed that the treatment makes the timber free from attack by insects, and that by a slight additional treatment the wood can be rendered fireproof. No details of the process or the preservative have been made public.—Engineering News.

ELECTRIC WELDING.*

BY P. NEY WILSON, ROCHESTER RAILWAY COMPANY.

I am in a rather peculiar position, having been with the Rochester Railway Company only about one week, and therefore not familiar with the performance of the electric welded joints in that city.

I shall not go into the subject of the details of electric welding so far as the equipment is concerned. This matter has been covered, I understand, very thoroughly in past meetings of this organization. Joints are unquestionably the most important detail in the permanent-way department. It is my opinion that no mechanical joint is equal to a good weld. Viewing this from the financial standpoint, or from the standpoint of the purely practical track foreman, the weld is the thing. We know that we can make a good roadbed if sufficient funds are available. Unless the joints are welded, we cannot by any means be positive that we can hold our joints.

Cost of Electric Welding.

I shall read a detailed statement of cost of welding 3,087 joints in Camden, N. J., which is the South Jersey division of the Public Service Corporation.

Summary of Costs of Electrically Welding 3,087 Joints, on Haddonfield Pike, Moorestown Pike, Kaighn Avenue, Broadway, State Street and River Road, Camden, New Jersey.

Cost of labor	\$7,031.24
Cost of material	581 00
	<u>\$7,612.33</u>
Credit from sale of old fish plates and bonds	2,816.59
	<u>\$4,795.74</u>
Cost of welding 3,037 joints @ \$5.25 each.....	16,206.75
Cost of replacing asphalt, 899.6 yds. @ \$2.53; 117 yds. @ \$2.51	2,569.65
	<u>\$23,572.14</u>
Total cost of operation	\$23,572.14
First cost per joint, labor	2.277
First cost per joint, material188
First cost per joint, labor and material	2.465
Cost per joint, labor and material, after credit is deducted	1.553
Final cost per joint, all labor, material, welding and asphalt charges	7.635
Cost per mile, under similar conditions, 30-ft. lengths..	2,627.52
Cost per mile, under similar conditions, 60-ft. lengths..	1,343.76

Cost Per Joint, Paving and Rail Section on Above Streets.

Haddonfield pike, 7-inch girder (P. S. Co. Sect. No. 238 and Cambria No. 824) rubble stone on sand, 989 joints..	\$ 6.684
Moorestown pike, 9-inch girder and 7-inch girder (P. S. Co. Sects. 238 and 200) rubble stone on sand, 1,128 joints..	6.704
Broadway, 7-inch girder (P. S. Co. Sect. No. 238) asphalt between rails and part of shoulder, Belgian block along rail, on 6-inch concrete.....	
Kaighn avenue, 7-inch girder (P. S. Co. Sect. No. 238) brackets between rails and shoulder, on 6-inch concrete, 779 joints	10.438
State street and River road, 7-inch girder (Cambria Sect. 334) rubble stone on sand, 191 joints	6.632

Total, 3,087 joints, average cost.....\$ 7.635

You will note that the credit for sale of old fish-plates and copper bonds represents rather a large figure. I admit that I was somewhat surprised at this figure myself, but it is based upon actual cash received from a local scrap dealer in making sale of the old material. I might add that the sale of the bonds figured very materially in making this figure so high. We used a bond devised by ourselves, which cost in material alone \$1.25 per joint. The material being almost entirely composed of copper naturally gave us a very good return in the way of credit.

Breakage.

Regarding expansion and contraction: We paid little or no attention to this matter, as I am strongly of the opinion that in the improved paving, there being little change in the temperature of the earth, there is correspondingly very slight expansion and contraction. In the total of 3,087 joints in one year, we had 32 breaks, or about one per cent. On Broadway and on Kaighn avenue we had a total of 779 welded joints, and none broken. These two streets were paved with asphalt on concrete. The entire number of broken joints occurred on Haddonfield Pike and Moorestown Pike where the track was laid on sand and paved roughly with rubble-stone. The condition of the paving was such that in the winter months the snow and ice had an opportunity to get in around the rail, and this condition I regard as the cause of the broken joints, as the same section of rail was welded in each instance.

Cost and Value.

The bonding of joints is so closely identified with the joint itself that one should be considered with the other.

*Paper presented at the quarterly meeting of the Street Railway Association of the State of New York, Buffalo, January 11, 1907.

This feature should be given consideration as a very important matter, as the question of installing a rail bond is, to my mind, simply a choice of evils; with the weld we know we must have a perfect bond. From the general manager's standpoint I think the matter should be approached in this way: In the case of old track with more or less battered joints, prices should be obtained upon a step-joint for raising the receiving rail sufficiently to surface the lowest spot in the dish with the abutting rail. To this figure should be added the cost of the bonds (loose and battered joints are usually accompanied with bad bonding); then add labor cost and incidental material and make a total. This total should be compared with the cost of welding.

In the case of the work in Camden I found that the cost of electric welding was less than the estimated cost of placing step-joints. I found by making tests of electrically welded joints the conductivity was equal to or greater than that of the solid rail section, using the Conant T-pole bond-testing machine.

I have heard the opinion expressed by several managers that they would not weld new track, but that welding was all right in the case of battered joints. Personally, this appears to me as a discrimination without a difference.

I learn from Mr. Kleinschmidt that the Lorain Steel Company has recently successfully applied the process to T-rail track on interurban lines, having welded a stretch of about six miles from Providence, R. I., to River Point. In this track they used expansion joints every 1,000 feet. They also welded the third rail on some two miles of elevated track in Brooklyn. Another interesting piece of welding was the new T-rail tracks on the Brooklyn bridge. As this rail is laid directly on the plank, it is evident that the electric weld was the only form of welded joint that could be used. There are, I believe, five expansion joints on each rail and no reports have been made to date.

In August, 1905, 1,770 joints were welded in Rochester. The cost of welding was \$5.00 per joint. Total cost, including welding and replacing pavement, etc., was \$11.25 per joint. Up to January 29, 1906, there had been 114 breaks, or about 6½ per cent.

On Monroe avenue, Rochester, out of a total of 303 joints there were 48 breaks, or 15 per cent. This was a Trilby rail and I believe Mr. Matthews attributes these failures to the type of rail, especially on account of the weak web. The fact that 415 joints were welded on Park avenue and Mt. Hope avenue and Main street, and none broken, seems to prove the above statement.

I would like to conclude by asking a question: The cost of placing a step-joint with bonds on old and battered joints is about one dollar more than welding. The cost of placing an improved mechanical joint is about the same as a weld. Why don't the general managers weld?

Signal Operation on Interborough Rapid Transit.

The report of the signal engineer of the Interborough Rapid Transit Company for the month of October, 1906, shows "failures" as follows:

Cause of Failure	Total No. Failures	Total No. Delays
Signals:		
Broken wire	3	5

During the month of October the number of signal and stop failures was 14. The number of signal movements was 6,718,346, making one failure to 479,881 movements. The interlocking and block signal system is operated electro-pneumatically with alternating current track circuit control, and was installed by the Union Switch & Signal Company.

It is to be remembered that the so called failure with this apparatus means that the signal from some cause indicates danger when the track is in fact clear, and not that it indicates clear when the track is not clear.

RAIL BONDS.

BY H. L. MACK, INTERNATIONAL TRACTION COMPANY.

The object of rail bonding is to join the ends of rails so as to afford an unbroken circuit through them for the return current. The carrying capacity of the bonds can be determined in the same manner as the carrying capacity of the feed wires. When the tracks or rails of one line are to carry return current from two or more lines, the carrying capacity of the bonds can then be determined on the carrying capacity of the feeder, on the two or more intersecting lines. Where numerous lines intersect and the return current is to pass over a single line, and in case the flow of current is greater than the carrying capacity of the rails there may be used a supplementary cable or cables with a carrying capacity to off-set the overload of current passing through the rails. This cable can be run along the rails or through conduit or on poles; but in any case the best results may be obtained by frequent connections to the rails. Where trolley tracks cross steam railroad tracks at grade, supplementary wires can be used with good results. These wires are of no value around curves or special work, but only at such places where the uniform bond cannot be applied. Grounding the rails to water or gas pipes is of no value. As to increasing the capacity of the return circuit, damaging results often occur through such practice.

Installing Bonds.

The question is often asked—What is the best bond? The best bond is that in which the greatest care is exercised in its application, as the workman can make the bond an effective connection, or so much junk. Too much care cannot be taken in such application, which should not be made until the hole in the rail is perfectly bright and free from rust, dirt or moisture. The terminal on the bond should also be bright and free from moisture before being put in. Bonds should not be applied in damp or wet weather, as moisture will start corrosion and greatly reduce their efficiency. In drilling rails for bonds the best results may be obtained by drilling dry and in no case should there be any oil used on the drill, as oil forms a coating at the point of contact and greatly increases the resistance of the bond.

Where holes for bonds are drilled in the rails at the mills they should be drilled 1/32 inch smaller than the diameter of the terminal of the bond, as the rails often become rusty before they are used, and if the holes should be drilled large enough at the mills, they would be too large after reaming out. The hole should be reamed out to exactly the diameter of the terminal. No type of bond should be installed by unskilled labor if good results are expected. One man should have charge of, and be responsible for, the installation of all bonds and keep as nearly as possible a complete record.

Test Results in Buffalo.

The International Railway Company has used nearly all types of bonds which it was thought would give good results. After long experience and a careful study of different types, we have adopted as a standard the compressed-terminal bond which we have used for several years with very good results. During the summer of 1906 we had the entire system gone over with the Albert B. Herrick autographic test car to determine the condition of the bonds; the test proved very valuable, as well as interesting. In the city of Buffalo there are about 19½ miles of electrically-welded track; the test showed this to be a uniform conductor the entire length, as when the rail ends are welded together it no longer remains a joint and affords no greater resistance than any other portion of the rail.

Compressed-Terminal Bonds.

The type of compressed-terminal bond which we use is a No. 0000, 10 and 12 inch flexible with 7/8-inch terminal; two of the bonds are put under the splice bars at each rail joint and if these bonds are carefully installed I believe they will be found the most reliable and after four or five years' service will show less resistance than any other type of bond which is on the market. At the present time we have this type of bond installed on some of the track which was laid in 1897 and 1898, and the tests taken in the summer of 1906 showed the resistance of the joint to be less than that of four feet of adjacent rail, which I think is very good in view of the fact that the importance of a bond or a complete re-

turn circuit was not considered as serious at that time as at the present.

Crown-Pin Bonds.

In 1900 we laid about 12 miles of track which was bonded with 10 by 12-inch No. 0000, crown-pin figure-8 bond, 3/4-inch terminal, two bonds in each joint put in under splice bars. A recent test made did not show these bonds to be as efficient as the compressed terminal bond. As the compressed terminal bond had been installed nine years, and the crown-pin bond but five years, this would show a marked difference in the efficiency, but in justice to the crown-pin bond, I may state that owing to the work being rushed and not enough time taken to afford careful installation, there was not the care exercised in applying these bonds that there should have been to give the best results. The bond has some advantages over any other type of bond when rebonding is necessary and trains or cars run at frequent intervals, and at high speed, and when it is not desirable to interfere with the service. Its application is very simple as it is only necessary to drive in a pin; the drilling and bonding can be done without placing any obstacle on the rail, such as a screw compressor, to cause any fear of derailment. This would apply mostly to high speed interurban lines, or to steam roads undergoing electrification.

Soldered Bonds.

I believe we were one of the earliest users of the soldered bond, which we started to use in 1893. After a number of tests, both electrical and mechanical, we thought we had solved the bonding problem; we not only used the bonds on all new track and track relaid, but we went in very extensively to rebonding. In about three years we had occasion to change some special work, where these bonds were used, and to our surprise we found some of them practically of no use at all, as the tinning between the bond terminal and the rail had very nearly all disappeared and rust taken its place. It is needless to state that we discontinued for the time the use of soldered bonds. The bond which we used was made in our shops; the terminal was about 2 1/2 inches in diameter, carefully planed off; the rail was also carefully cleaned off with a special tool made for the purpose; the bond terminal and rail were both tinned before installing the bond so it is quite evident that our experience with soldered bonds has not been very satisfactory. About one year ago we had installed by one of the leading makers about 500 soldered bonds and I have just recently made a test of a number of these bonds and am pleased to state the results were very satisfactory. I do not believe enough is known of soldered bonds to determine their exact location in the scale. I would like to see a soldered bond not only stand as a competitor to other types of bonds but to rank first in the list, as I believe it is the most practical of application and has the highest electrical test when first applied. What remains to be determined is the life of the bond.

Southwestern Traction Company to Abandon Ganz System.

The stockholders of the Southwestern Traction Company of London, Ont., have approved the plans of the board of directors for discarding the Ganz two-trolley three-phase system now in use, which has proved unsatisfactory during the past season, and substituting the direct-current system. The current is now generated at a power house located at Chelsea Green at a pressure of 10,000 volts. Transmission lines carry the current at this voltage to transformer stations located along the line, where it is stepped down to 1,000 volts, three phase, and fed to the double trolley wires. The rails constitute the third conductor of the circuit. It is expected to have the new system installed and in working order by May 1, without interrupting traffic. The contract for the electrical equipment, substation apparatus, car motors, etc., has been let to the Canadian Westinghouse Company of Hamilton, Ont. At present the company operates three passenger cars which run at a speed of about 30 miles per hour and stop only at towns. Three combination passenger, baggage and express cars running at a slightly lower rate of speed are used for the local service. An hourly schedule is maintained. Considerable new rolling stock has been ordered from the Ottawa Car Company. These cars will be 50 feet in length, with seating capacity for 54 passengers and provided with smoking compartments. The company's plans also provide for the erection of a substantial brick depot at the London terminal, with accommodations for passengers and express; also the erection at Lambeth of a substantial building to be used as a substation, passenger and express depot, and dispatcher's office. The road is operating from London to Ft. Thomas, Ont., and under construction to Port Stanley, 20 miles.

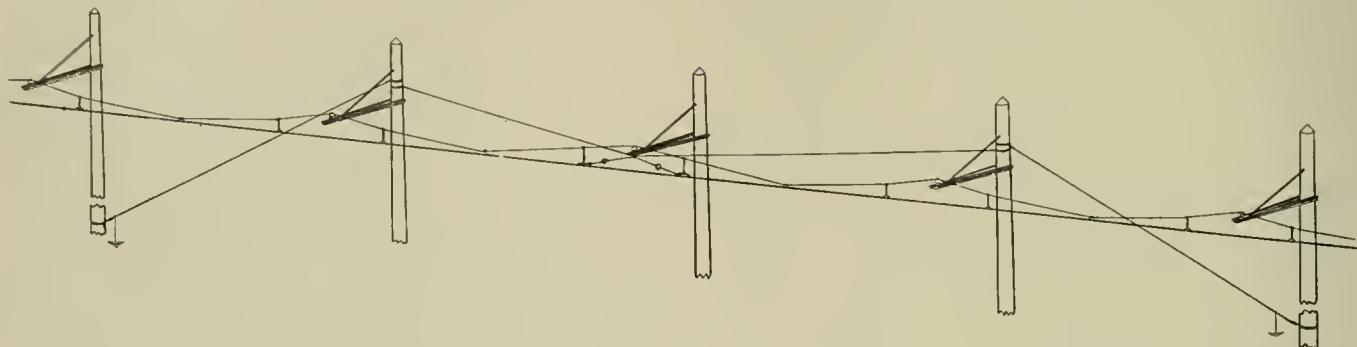

*Paper presented at the quarterly meeting of the Street Railway Association of the State of New York, Buffalo, January 11, 1907.

SPAN AND CATENARY CONSTRUCTION.*

BY G. E. EVELETH.

The primary cause for the change from bracket and span construction, as ordinarily used for direct current, to catenary construction was the difficulty in obtaining suitable insulation with higher voltages. With the trolley wire supported by a messenger wire, which in turn can be directly supported on porcelain insulators, there is no difficulty in obtaining sufficient insulation for almost any voltage. This type of construction results in a more flexible trolley wire and one which a wheel follows with much less jumping. By providing additional points of support the deflections of the trolley between supports may be decreased as much as desired. Another advantage of the catenary is that when used with trolley-wheel collectors there is little chance of the overhead work being pulled down by catching of the wheel on the supporting wires when the wheel comes off the trolley wire. It is only at curves that there is anything which could give trouble from this source as the tangents are entirely clear even at anchors.

With catenary construction it has been found feasible to increase the distance between poles up to what is now considered a standard distance of 150 feet on tangents with shorter distances on curves. The poles are set about 6 feet to 6 feet 6 inches in the ground. With bracket catenary construction the poles are given an outward rake at the top of about one foot. Guys are needed only on curves or where the ground has poor holding qualities, since with bracket supported trolleys the strains tending to bend or displace are only from one-fifth to one-tenth as great as those existing

Typical Form of Catenary Suspension.

with span construction. The question of doping the poles with tar or protecting them at the ground surface with cement and asphalt is largely a matter of individual taste.

A new element is introduced in the requirements for a bracket with the catenary construction. When the trolley is installed the maintenance will depend largely upon the exact balance of forces on the messenger wire, which means that the deflection for the individual spans should be the same. It is desirable then to have a certain amount of rigidity in the horizontal direction so that the initial dip of the messenger wire may be adjusted to the desired amount. To obtain this stiffness an angle iron bracket has been designed, consisting of 2 by 2½ by ¼-inch angles fastened together with suitable spacing blocks at the end over the track at a point 18 inches nearer the pole. Through this latter block is passed the stay bolt supporting the bracket from the pole top. The angle brackets are shipped unbent, as they are flexible enough to spring out sufficiently to take the pole.

For double track work longer angle irons are used, which are riveted together with suitable spacing blocks at each end. These may be sprung open and slid down over the top of the pole. Where this is impossible, due to wires or other conditions, one end of the bracket is usually bolted. The distance mentioned between the spacing blocks on the bracket is provided to allow an adjustment of the insulator position to accommodate alignment of the trolley and provide means to obtain staggering when the bow or pantograph collector is used.

The short iron pin designed with a special base and having a bolt passing up between the two angle irons is used to support a standard type of insulator, which is preferably made in two pieces cemented together. The insulators are cemented to the pins. Cementing is preferred to threading, as it gives the porcelain a more rigid backing and so aids

materially in preventing breakage from missiles. It will be seen that any friction due to movement of the messenger wire on the insulators will create a force tending to twist the insulator around the bracket. This is prevented by the pin stud passing between the two angle irons.

If rigid economy requires a lower cost bracket than the angle iron. One made of T-iron would be the next choice, as this possesses a shape to which the insulator pin may be readily attached without danger of twisting around the arm, though this latter bracket is undesirable from the construction standpoint as it has no stiffness in the horizontal plane.

For single-track work it is well to raise the outer end of the bracket two or three inches so that when loaded with a messenger wire and trolley the pole deflection will make the bracket level.

When the poles and brackets have been put in position and the insulators installed the line is ready for the messenger wire, which for trolley wire up to No. 0000 capacity usually consists of a 5-16-inch second grade or high strength 7-strand, double-galvanized steel cable having an ultimate strength of about 8,100 pounds, or a ¾-inch Siemens-Martin 7-strand, double-galvanized steel cable, having an ultimate strength of about 6,800 pounds. The grade first mentioned requires the use of mechanical clamps at the splices, while the softer steel can be made up into the usual cable joint. One or two miles of this messenger wire are usually run out and pulled up to give the required uniform deflection before loading with the trolley wire and fittings. For a 150-foot span at about 50 to 75 degrees F. the initial deflection of the wire should be about 16 inches. With the messenger wire in place the trolley is run out, pulled tight and clipped in at the center points of the spans. This will change the span

deflection at the center from 16 to 24 inches. The deflection will be about 28 inches when the rest of the hangers have been installed with three or more points of suspension. It is well to anchor the trolley while clipped in at the center points only so that any change in the relative position of trolley and messenger wire will not necessitate adjusting the additional suspensions. Both the trolley and messenger wires should be anchored at each end of every curve. The messenger wire deflection as given seems to be about the most satisfactory for 150-foot spans, as less deflection will cause much more variation in height of the trolley wire due to temperature changes and make the system rigid, while more deflection makes the whole system too flexible in the horizontal plane.

For years the spacing between trolley supports has been in the neighborhood of 100 feet. Many roads are now running quite satisfactorily with wheel trolleys with this spacing up to speeds of 60 miles per hour. It is probable, therefore, that with the direct-current trolley-wheel collectors and three-point suspension, bringing the distance between points down to 50 feet, will be entirely satisfactory for any reasonable speed. With sliding contacts of either the bow or pantograph type, having much more inertia than the wheel collectors, a closer spacing of supports is doubtless of advantage, as this makes the difference in level between the supports and center points of spans sufficiently less to enable the heavier collecting device to follow the wire and also lessens the blow at each support. There is nothing to decide just the number of points to give the best results, but it appears that the stiffness of a No. 0000 trolley is such that the system seems to pass the point of maximum flexibility when the supports are about 15 or 16 feet apart. If they are closer than this a contact passing under a support not only raises that support but the two adjacent ones, while at this spacing the trolley wire will bend and lift only the support under which the collector is passing. If more than three points of

*Paper presented at the quarterly meeting of the Street Railway Association of the State of New York, Buffalo, Jan. 11, 1907.

suspension are used the weight of trolley carried by the center point is not very great, and an initial twist in the trolley conductor is liable to cant the center point ear sufficiently to cause it to hit on the moving collector. It is, therefore, desirable to allow a greater distance between the lowest point of the messenger wire and the trolley so that the weight of the latter will be sufficient to prevent an initial twist canting the center point hangers.

Inertia tests on the pantograph collectors indicate that with a properly installed trolley supported every 20 or 25 feet, there is sufficient activity of the collector to follow up the deflections in the trolley wire, even supposing that these deflections were not actually reduced by the pressure of the collector on the wire at intermediate points between suspensions.

A number of styles of connection have been developed to support the trolley wire from the messenger, but the one which is recommended most strongly at the present time consists of a sister hook of malleable iron grasping the messenger wire, having a flat strip of steel $\frac{1}{8}$ by $\frac{5}{8}$ inch, connecting this sister hook with the clamping ear. This ear has been made up in a variety of forms and the selection of the type is largely a matter of personal choice, as a number of mechanical and screw clamp ears have been developed for this purpose.

With the pantograph collectors a clearance of about 6 inches vertically, 3 feet away from the trolley wire is required for clearance on curves where the outer rail is elevated, throwing the collector contact surface at an angle with the horizontal. Since the pull-offs must be on the outside of the curves where the clearance space is necessary a bridle arrangement has been adopted, which consists of $\frac{1}{4}$ -inch seven-strand cable attached to a special clamping ear with eye on the trolley wire and a special sister-hook with an eye on the messenger cable. A rod forms a rigid connection between sister-hook and ear. The strain insulator is inserted in the apex of the triangle formed by this bridle. With curves of large radius, a device known as the "steady brace" is used to push off the trolley wire at a point directly below the bracket. This push-off brace consists of a screw-clamp ear to which is attached a gooseneck piece of $\frac{5}{8}$ -inch threaded steel rod, which in turn is attached to the end of a wooden stick about two inches in diameter. The other end of this stick is fitted into a socket carried, in the case of high voltage work, by a special porcelain insulator, which is so pivoted at the pole as to allow the motion in a horizontal plane that is required by movements of the trolley wire. In double-track work the principle of the bridle pull-off is used just as the double-curve hanger for direct current work.

It is well to anchor the trolley about four times to the mile. The anchor is attached to the trolley about 25 feet either side of the pole anchor bracket, which in turn is anchored to adjacent poles. The change from the center point of span, where the anchor cable would be nearly parallel to the trolley wire, to this location nearer to the bracket is necessitated by the danger of a loose anchor cable catching in a sliding contact. With this type of anchor and a wheel-collector the angle between the anchor guy and the trolley is so small that it is not possible to catch a wheel between them.

All of the catenary material is installed suitable either for wheel or bow collectors, with the exception of the frogs which must be special for each condition.

The strain insulator required for this high voltage work has been one of the most difficult problems to solve, but a solution has been very well worked out in a special type of insulator made of porcelain, weighing $4\frac{1}{2}$ pounds and capable of withstanding 12,000 pounds pull, or in other words more pull than any cable used in this sort of construction.

It seems difficult of belief that public cars in New York carry far more passengers than in London. Such, however, was the case for the year 1905. The omnibuses, trolleys and underground railways carried in London, in 1905, some 604,834,000 passengers, as compared with 596,315,000 in 1904, an increase of 1.4 per cent. In New York the figures are 1,442,347,999 for 1905 and 1,241,939,000 for 1904, a gain of 7.6 per cent. Both figures are more than double the corresponding figures for London.

At the Rochester branch of the Street Railway Young Men's Christian Association it has been found a satisfactory practice to use the association's funds for cashing weekly payroll checks of the members. This association conducts educational classes in rooms especially fitted for the purpose at one of the branches in Rochester. The average daily attendance is 575 and the number of lunches served in the association restaurant is 327.

NORTHWESTERN ELECTRICAL ASSOCIATION.

The fifteenth annual convention of the Northwestern Electrical Association was held at the Coliseum building, Chicago, on January 16, 17 and 18, in connection with the electrical show of the Chicago Electrical Trades Exposition Company. Both morning and afternoon sessions were held. President Harold Almert occupied the chair. Thursday evening, January 17, a meeting was held in connection with that of the Illuminating Engineers' Society. A large number of interesting papers was read, as follows:

"Warrantable Expense for Meter Testing," by O. J. Bushnell.

"Profitable Co-operation," by J. Robert Crouse.

"Water Powers of Wisconsin," by Ernest Gonzenbach.

"Some Characteristics of Alternating Current Motors in which the Central Station Man is Vitally Interested," by C. W. Bergenthal.

"Producer Gas Power." General discussion.

"Outline Lighting," by Homer Honeywell.

"Some Phases of Smaller Central Station Management," by H. H. Scott.

"Uniform System of Accounting for Small Companies," by Fred W. Insull.

"Some Points in Illuminating Engineering for the Small Central Station," by J. R. Cravath.

"The Trend of Improvement in the Design and Operation of Boiler Plants," by A. Bement.

"Premiums to Employees," by Ernest Gonzenbach.

ILLUMINATING ENGINEERS' SOCIETY.

"Large Versus Small Units in Street Lighting."

"Globes and Reflectors for Street Lamps."

"New Street Lights."

At the Friday morning session Mr. Ernest Gonzenbach, general manager of the Sheboygan (Wis.) Light, Power & Railway Company, addressed the meeting on the subject of "Premiums to Employees," giving an interesting explanation of the premium system as applied by his company. He said that he had wanted to reduce the cost of power production by awakening an interest in the employees, but without scattering broadcast among the public the cost of producing electricity. Therefore, about a year ago, after calculating the cost of coal, oil, repairs, etc., for a year he told the men that a certain per cent of the saving over that amount should be divided up each month among the employees according to the rank of the men, the engineers receiving the largest per cent. The men were not told the exact per cent of the saving. This system had proved very satisfactory and had produced a spirit of rivalry and interest among the men which was very advantageous to the company. The firemen watch the engineers to see that they do not waste the power and the engineers watch the firemen to guard against the use of too much coal. He said that the highest compliment to this system had been paid by a coal company, which objected because the employees were too scrupulous in inspecting the coal. On one occasion when the carelessness of an engineer had wiped out the entire month's premium in cost of repairs it had been unnecessary to ask the man to resign because the men made it so uncomfortable for him.

This system had also been applied to the sollicitors for the lighting business. Many sollicitors had gone away from the town disgusted with their lack of success because Sheboygan is very socialistic and the feeling against public service corporations is so strong that the sollicitor's task is made exceedingly difficult. After considerable experience of this kind it was decided to employ as sollicitors men who resided in the town and understood the peculiarities of the people. All employees who had to deal with the public were organized into a business board which met every Monday night and held regular board meetings, electing their own officers, and this had created an esprit de corps, which produced very satisfactory results. Every month 10 per cent of the increase in revenue from the lighting department over the same month of previous year was set aside and distributed among the men. During the year the system has been in force the average increase per month over the corresponding month of the pre-

vious year had averaged over 16 per cent. The premium system was an incentive to each man to treat the public with increased interest and courtesy.

In the discussion which followed, the opinion was expressed that under the premium system as applied to the power house there would be a tendency to keep the amount of repairs as low as possible for several months in order that the premiums might not be affected and to bunch the repairs into one month. Mr. Gozenbach said that large repairs, such as alterations, were not included in calculating the premiums, and there has been no tendency to hold off the smaller repairs in order to keep the premium up.

Mr. A. Bement, then read a paper on "The Trend of Improvement in the Design and Operation of Boiler Plants," which will be found elsewhere in this issue.

The following officers were elected for the ensuing year:

- President, Edward Daniels, Menominee, Wis.
- First vice-president, B. C. Adams, Lincoln, Neb.
- Second vice-president, H. F. Pierce, Negaunee, Mich.
- Secretary-treasurer, R. N. Kimball, Kenosha, Wis.
- Directors: J. S. Allen, Lake Geneva, Wis.; W. R. Putnam, Red Wing, Minn., and Geo. H. Lukes, Evanston, Ill.

The next meeting of the association will be held at Milwaukee, Wis., January, 1908.

STUDENT RECORDS IN MEMPHIS.

In order that a complete record may be kept of the student work of all new conductors and motormen, the Memphis Street Railway Company uses instruction order-blanks

P. F. Campbell
Form No. 13-10-08

THE MEMPHIS STREET RAILWAY COMPANY

INSTRUCTION ORDER STUDENT BADGE

No. _____ MEMPHIS, TENN. 190 _____

ISSUED TO _____ MOTORMAN'S BADGE No. _____

On entering the service Students will be given this blank. Students will be assigned to the different lines, one at a time, until he has completed his course of instruction and has learned all of the lines. The Motorman or Conductor in whose charge the Student is placed for instruction, will O. K. the Student in the space provided, after he is competent to perform the duties required of him on that particular line, and no until he is competent. After the Student has completed his course of instruction on all the lines, he will report for examination.

Assigned to _____	Badge No. _____	Assigned to _____	Badge No. _____

Student's Instruction Record as used at Memphis. (Original 8 3/4 by 10 inches.)

for each "student." These blanks present spaces for each of the 14 lines operated by the company. When the student is assigned to one line he remains there until his instructor, either conductor or motorman as the case may be, is satisfied that he is competent to perform the duties required of him. The instructor then fills out and O. K.'s the blank for his line, and passes the new man to the foreman instructor for assignment to another line.

It is required that the student learn the peculiarities of each of the 14 lines before he will be given charge of a car. When the instruction order-blank has been properly filled out it is filed in an envelope with the student's application for employment, his recommendations and other records that have been gathered of him.

Men who have not qualified for the operation of a car over all the lines are furnished with badges reading "Student Motorman" or "Student Conductor." As soon as their courses of instruction are completed the "student" badges are taken up and the standard badge issued in its stead.

THE CHICAGO TRACTION ORDINANCES.

We present herewith a brief abstract of the principal features of the two ordinances reported to the Chicago city council by the local transportation committee on January 15 as the basis of a settlement of the long pending street railway controversy. The committee has been working out the terms of the settlement ever since the United State supreme court in the famous "99-year case" last spring declared that the greater part of the franchises of the Chicago City Railway and Chicago Union Traction companies had expired. Since the decision of the court the companies have been operating under a temporary license from the city. The ordinances now in the hands of the council give the Chicago City Railway Company and the Chicago Railways Company, which is to reorganize the Chicago Union Traction Company, a license to operate a street railway system in designated streets from February 1, 1907, to February 1, 1927, or until the city or a company licensed by the city shall purchase the properties with a view to eventual municipal operation.

They have been agreed upon, after numerous and exhaustive conferences in the committee, by the city authorities and the financial interests controlling the companies, and represent compromises on many important points, particularly in regard to the value of the properties. The valuation decided upon, \$21,000,000 for the Chicago City Railway and \$29,000,000 for the Union Traction Company, was fixed after thorough inventories had been made both by the companies, who called their property worth \$74,000,000, and by a commission appointed by the city, who estimated the property at approximately \$46,000,000. The ordinances differ materially from a franchise contract and contain several unusual features. In effect, they constitute a partnership contract between the city and the companies until the city is in a position to adopt municipal ownership. In the provisions for the operation of the roads under this partnership, the reconstruction of the property and the terms of municipal purchase, the two ordinances are identical. The Union Traction ordinance differs from that for the City Railway only in the provisions for reorganization, for the perfection of its title to the north and west side lines, for the relations with the Consolidated Traction Company, which is controlled by the Union Traction Company, but which still holds its franchises, and for the construction of new river tunnels to connect with the future subway system.

Under the terms of the Foreman resolution, passed by the council, a petition asking for a referendum vote on the ordinances at the April election is to be circulated. If 86,000 voters sign the petition before February 2 the council may pass the ordinances subject to the referendum vote. If the petition does not receive the required number of names it will be taken for granted that the people approve the ordinances and the council may pass them at once, the work of rehabilitation to begin immediately thereafter. The most important features of the two ordinances, which it is believed will be passed in substantially their present form, are as follows:

Reconstruction.

Both ordinances provide that the work of reconstructing the street railway properties and of bringing the service up to the highest attainable standard shall begin at once under the supervision of a board of supervising engineers selected by the city and companies. The cost of the rehabilitation is to be borne and paid by the companies, it being provided that no contract or subcontract (except in the case of tunnel construction) shall be let by the companies without the approval of the board of engineers, and no bills for material and labor paid without similar approval. To the actual cost of the work 10 per cent will be added as contractor's profit and 5 per cent as brokerage in the procuring of funds. The board of engineers will report monthly to the city comptroller the amounts expended for rehabilitation and extension. In the case of the Union Traction Company it is provided that the reconstruction cost may be represented by bonds bearing 5 per cent interest and maturing not earlier than 20 years hence.

Cars.

Within three years the City Railway shall have 800 and Union Traction 1,200 new and thoroughly up-to-date cars in operation.

besides a certain number of cars now in service which they will be allowed to retain. The cars must be kept clean and well ventilated and not below 50 degrees in temperature. Single cars only are to be operated after one year from the passage of the ordinances. The companies also bind themselves to abide by any reasonable service regulations imposed by the council, the board of engineers to be a judge of the reasonableness thereof.

Motive Power.

The motive power shall be electricity, and after the expiration of three years the companies may be required to install the underground trolley system.

Subways.

The city has the option of building a subway through which the companies will be required to operate cars, or of exacting a contribution of not more than \$5,000,000 from the companies to apply on the cost. The title of the subway is to be held by the city in any event, but only the grantee companies may use the system for street railway purposes during the life of the ordinance. Three-fifths of the amount advanced toward the cost shall be paid by the Union Traction and two-fifths by the City Railway. The location and extent of the system is to be specified by the council and the plans approved by the board of engineers. After the expiration of five years the companies may be required to join the city in building subway extensions. At the same time the companies may be required to operate cars on the surface of such streets as they occupy underground, and if the capacity of the subway permits the city may require and authorize elevated railways to operate underground on payment of a rental.

Board of Engineers.

Within 30 days from the acceptance of the ordinance each company will select an engineer and the city an engineer to sit on the supervising board. The third engineer is to be Blon J. Arnold, in full charge of the rehabilitation work. The city, or the companies, may remove its engineer at any time, and the third engineer may be removed by agreement between the city and companies. In case of disagreement the judges of the first district appellate court may appoint and remove the third engineer, and in case of the failure of these judges to act either party may apply to the circuit court for redress. The courts may be asked to remove any of the engineers on charges of fraud or corruption. The city's and the companies' engineers are to receive not less than \$3,600 nor more than \$10,000 a year, and the third engineer is to receive \$15,000 a year, and \$15,000 a year additional during the three years of rehabilitation.

Through Routing.

Through routes will be established jointly by the companies, 21 such routes being specified in the ordinances, running from Seventy-first street to the northern and western limits of the city. Other such routes may be added from time to time by the city council with the approval of the board of engineers.

Fares.

With the fare remaining at 5 cents for a continuous ride, universal transfers are to be given passengers everywhere except in the downtown district, bounded by Twelfth street and the river. Outside of this district transfers will be interchangeable between the lines of the Union Traction, City Railway and Chicago General Railway companies, the last-named operating in Twenty-second street. Transfers are to be good till 15 minutes after the time the passenger's car reaches the transfer point. No passes are to be issued, and only employes of the company, city policemen and firemen in uniform may ride free. Mail carriers may ride free provided the postoffice department shall reimburse the companies on the basis of the number of carriers and the amount paid in 1905.

Division of Receipts.

There will be an annual accounting and division of net receipts between the city and the companies on April 15 of each year. From the gross receipts will be deducted all operating expenses, including maintenance, repairs and renewals, percentages of special funds for these purposes and depreciation, and personal injury claims, taxes, assessments, engineers' salaries, together with 5 per cent interest on the amount of the purchase price which the city would be obliged to pay if purchasing at the close of the year. In the case of the Union Traction Company a deduction may also be made for a special fund to protect the city against interest charges on bonds. The net receipts then remaining are to be divided, 55 per cent going to the city and 45 per cent to the company.

Purchase by the City.

The city may purchase the properties of the companies at any time upon giving six months' notice of its intention. If the city desires to operate the roads the price to be paid will be the value of the present properties \$50,000,000 plus the cost of reconstruction and re-equipment. The amount shall be paid in cash to the companies and the city will take over any incomplete contracts for construction or deposit sufficient funds to cover the cost of the work. These conditions having been fulfilled the city will enter into possession of the properties free of all liens and claims except such as are created by the ordinance. Without intending to operate the roads the city may purchase unconditionally at any time prior to February 1, 1927, on the payment of a 20 per cent bonus in addition to the purchase price.

Purchase by a Licensee.

The city may authorize a licensee company to purchase the properties from the companies on payment of the city's purchase

price and a 20 per cent bonus. The licensee will not be required to pay the bonus provided that it has entered into a valid contract with the city to operate the properties for only a 5 per cent profit on the investment, 95 per cent of the profits going to the city. If the city or its licensee purchase during the three years' construction period it is provided that the City Railway shall be permitted to finish the work under way and planned. The city must then deposit in trust sufficient funds to cover the cost of this work, including the 10 per cent contractor's profit and the 5 per cent brokerage, to be paid out by the depository at the order of the engineers. In the case of Union Traction the city has the option of allowing the company to complete the work or it may pay only the purchase price and assume the property subject to the construction bond liens. If the city does not purchase before February 1, 1927, it may designate some person or corporation to purchase as its licensee on the same terms as the city might purchase. If the city does not exercise this right it may grant the right to operate in the streets to another company, which shall purchase on the same terms as the city.

Chicago Railways Company.

The Chicago Railways Company agrees to acquire all the property and rights of the Union Traction Company within 120 days after the passage of the ordinance provided a clear title can be obtained on the same terms as the city's purchase price, which at this time is \$29,000,000. In case such a clear title cannot be thus obtained the company has 30 days more in which to promulgate a plan of reorganization of Union Traction which shall be approved by Judge Grosscup or Judge Seaman. It is stipulated that this plan must recognize fully the rights of all securities involved. Not later than January 20, 1908, the company must proceed to perfect its title, the city using its powers to assist and the company agreeing to indemnify the city for all expenses so incurred. By the end of three years from the passage of the ordinance the title must be perfect and the company have deposited in trust a majority of the stock of the North and West Chicago Street Railroad companies and two-thirds of the stock of the North and West Chicago Street Railway companies and the Union Traction Company. If the company afterward fails to comply with the terms of the ordinances these stocks are to be held subject to the control of the city in perfecting the title. The company is to have no right to accept the ordinance unless it is in legal possession of the properties and in a position to comply with the terms.

New Company's Guarantee.

The new company guarantees to give the public through routes, one fare, and universal transfers over the Consolidated Traction lines, and to protect the city against any diminution of receipts by virtue of its operating agreement with the subsidiary company. This operation agreement is to be canceled by the company when the city purchases if the city so requires. If the company defaults on any of the terms covering the Consolidated situation, the city may take over the properties and operate them, paying the company 5 per cent on the purchase price at that time and retaining all the remaining net receipts. In case the Union Traction Company fails to accept its ordinance, the City Railway is authorized to extend its lines to the north and west sides through the medium of the Chicago City Railroad Company. If the City Railway fails to accept its ordinance the Union Traction Company is authorized to extend to the south side.

Improvements at Covington, Ky.

Extensive improvements are being made to the power house and tracks of the South Covington & Newport Street Railway Company of Covington, Ky. This company's lines connect Covington with Cincinnati, O., and with Newport, Ky.

During the past season the company has expended upwards of \$200,000 in laying new rails and repairing its tracks and it is announced will spend an additional \$150,000 during 1907. Especial attention is being given to the relaying of special track work. Where new steel is necessary 96-pound rails in 60-foot lengths are used. The track is laid in concrete and is paved with brick between the rails.

The improvement of the Newport power house and its equipment includes the installation of a Curtis turbine unit of 2,250 kw. capacity, two 500-horsepower Stirling boilers with superheaters, Sturtevant economizer, Jones underfeed stokers, Wheeler condenser, vertical-triplex motor-driven Wheeler-Mullan dry vacuum pump, and a water softener and purifier.

Additions 16 by 30 feet and 35 by 50 feet, respectively, have been built to the engine room to accommodate a new switchboard and the turbine unit. Provision is made for the installation of a second turbine at some future time.

China now has a railway mileage of about 9,000 miles. Of this 1,330 miles are in operation and the rest under construction, except 930 miles "in abeyance." Last year the Chinese Imperial Railways, 526 miles, paid 20 per cent on the capital outlay.

TENDENCY IN DESIGN OF BOILER PLANTS.*

BY A. BEMENT, M. E.

The most useful suggestions that the author feels he can offer concern some features of boiler and furnace design.

The usual boiler does the largest portion of its work with the smaller portion of its surface; the horizontal water-tube type provided with two flame plates, ensuring three passes of the gases across the tubes, does from 70 to 90 per cent of the work in the first pass, or in other words, with one-third of the boiler surface, while the other two-thirds, or 66 per cent, performs only from 10 to 30 per cent, and this performance applies to other types in corresponding measure. Thus the larger proportion of the investment is in that part of the apparatus which renders but little service. One of the reasons why the boiler surface is not brought into more active service, is that the proportions of the gas passages are such that the natural volume of the gases can not fill them, therefore many corners and portions of the passes are not filled with hot gas, because the pass is larger than the mass of gas flowing through. Thus the work is performed along an exactly defined path over which the gas naturally flows, the most direct one from the furnace to the chimney.

For this reason it does not pay to use a large boiler as compared to a small one, unless with the larger, provision is made for as good utilization of the surface as secured with the smaller one. For example, one of the Heine type of 11 tubes high is approximately of the same capacity as one of 17 tubes high when equipped with the same sized grate, because the magnitude of the gas volume is the same from each, and it will be only that portion of the surface over which this gas flows that will absorb heat, and the distance from the entrance to the exit of the tube surface is approximately the same for each. Or with the Babcock & Wilcox type, as much work could be obtained with a boiler 16 feet long as now baffled, as in one of 18 feet, with the result of saving not only a small amount of investment required for boiler, but a large amount in land and buildings.

The truth of the foregoing has begun to be realized, and the tendency is for better proportioning of gas passes, so arranged as to ensure the use of a larger portion of the boiler surface than under present practice. For illustration, the performance of three boilers of the Heine type will explain the matter. One of these boilers was equipped in the usual manner, allowing the gas to flow diagonally across the tubes directly to the exit, while with the others, by means of additional baffles, the gas flowed twice the length of the tube surface in one case, and three times in the other, all three boilers having the same size and kind of grate. The relative performance was as follows:

Heine Type of Boilers	Relative work performed —by boilers—	
	Capacity	Amount of steam per pound of coal
With single flow of gas.....	1.00.....	1.00.....
With double flow of gas.....	1.04.....	1.10.....
With triple flow of gas.....	1.04.....	1.20.....

This emphasizes the importance of utilizing as much of the boiler surface as possible.

Up to a certain point the application of additional baffling will increase the capacity, owing to the fact that the amount of heat absorbed will be greater, but beyond this the reduction of draft due to the more restricted passages, will be sufficient to result in a decrease in capacity. To overcome this, special means for draft production are justified, and it has been considered possible, by means of proper baffling and a combination of forced and induced draft, to get twice the capacity from the same sized boiler as now obtained, and do so with no loss in efficiency, which would mean a saving in investment cost of one-half the boiler plant, land and building, at an added expense only of draft producing apparatus.

The setting for boilers is something which is now having special attention, as it is found that even the very best brick setting is very leaky, allowing the entrance of much cold air. As a remedy, steel jackets and reinforced concrete have been used, also brick settings have been sealed by applying a tight cement covering, over which canvas has been pasted and then painted.

Requirements for good furnace performance are, that there should be an ample combustion chamber located between the grate and boiler, in which combustion shall be enabled to continue until completed. Also, that the feed of the coal shall proceed at as nearly a uniform rate as possible, and that the removal of ash be accomplished with a minimum disturbance of the fire.

*Read before the Northwestern Electrical Association, Chicago, January 18, 1907.

ELECTRIC RAILWAY PROGRESS IN KENTUCKY.

Although the state of Kentucky has not as yet been especially active in the initiation of electric railway projects, in the central and northern part of the state the electric railway interests are now awakening to the new opportunities in this field and are planning many improvements, to keep up with the rapid advances along industrial and commercial lines.

Many of the street railways of Kentucky were built when power house, track and roadway and trolley construction had not attained their present state of perfection and since their inception but little new work has been done on them. As a result of this inaction, since Kentucky has emerged from its almost lethargic condition the railways have proved inadequate to care for the new travel. The operating companies have found it necessary practically to rebuild their city lines and to plan interurban railways to accommodate the demands made by the residents of the rural districts.

This is especially true at Lexington, Louisville and Covington, the three leading cities of the state. At Lexington, which is located in the center of the productive Blue Grass territory, a system of interurban railways is being built that bids fair to compare favorably with that radiating from any other city of the middle west. The Lexington & Interurban Railways Company, which owns or controls the city railways at Lexington, Frankfort and Winchester, has three interurban railways operating out of Lexington and is contemplating the construction of new ones that will be operated in conjunction with the existing lines. The operating lines serve the cities of Paris, located 19 miles to the northeast, Georgetown, located 14 miles to the northwest, and Versailles, located 12 miles to the west of Lexington.

By referring to a map of Kentucky it will be noted that exceptional opportunities are presented by the cities located within a radius of 30 miles from Lexington for the development of a compact system of interurban railways. Grading for a line to Frankfort, the state capital, has practically been completed. This line, which will be about 30 miles long, will be in operation during the coming summer. The right of way for a line to Winchester, a distance of 16 miles to the east, has been secured and it is expected that its construction will begin during the year. Other interurban projects under consideration by the company are lines to Richmond and Nicholasville, which are located to the southeast and southwest, respectively, from Lexington.

Heretofore the Lexington & Interurban Railways Company has not paid especial attention to the development of its power stations and car houses nor to the remodeling of its city tracks but it is announced that these are to be rebuilt at an early date.

At Louisville and Covington the operating companies are making many improvements in city and interurban properties which will better enable them to care for the increasing traffic. At Somerset a new street railway has been constructed by the Somerset Railway & Light Company. Cars began operating on this line on January 1. At Bowling Green a new power house is to be built for railway and lighting purposes, the city tracks are to be repaired and extended and it is projected to build an interurban railway to several of the nearby towns.

The Boston & Montana Mining Company, of Butte, Mont., has contracted for five electric locomotives and a complete underground haulage system. The engines will cost about \$2,000 each and are to be delivered in ninety days. They will be of the Baldwin pattern with Westinghouse equipment. The installation of these engines and proper electrical appliances to operate them will do away with the present system of tramping. When the Boston & Montana began operations men were employed to do the tramping, but eventually horses were substituted and are now in use

News of the Week

Chicago Traction Situation.

The Chicago traction ordinances were reported to the city council by the local transportation committee at the meeting on January 15, and according to the Foreman resolution adopted at that meeting, they cannot be passed until after February 2. The city officials are to circulate a petition asking the board of election commissioners to place upon the ballots at the April election the question of public policy as to whether the pending ordinances granting an indeterminate license to the Chicago City Railway Company and the Chicago Union Traction Company shall be passed. If the petition does not receive the signature of one-fourth of the registered voters of the city, or 85,000 names, before February 2, it will be taken for granted that the people approve the measures. If the required number of signatures to the petition is secured the plan is to pass the ordinances at once, with a provision making their validity conditional on the approval of the voters as indicated by the referendum vote.

At a meeting of the committee on January 11 the mayor demanded that the amount to be expended by the companies for rehabilitation be limited so as to bring the total value of the properties, including the cost of reconstruction, below \$75,000,000, the amount the city is empowered to expend to secure municipal ownership.

As the value of the properties has been fixed at \$50,000,000 and the cost of reconstruction is estimated at from \$40,000,000 to \$50,000,000 the mayor thought that the possibilities of municipal ownership were fading into the dim distance. He also desired a provision guaranteeing that the city's percentage of the net receipts should amount to a certain per cent of the gross earnings. Both plans were voted down by the committee.

The Referendum League in connection with other civic and municipal ownership organization on January 11 began circulating a referendum petition which combined the question of repealing the Sunday closing laws with the traction question on the same ballot. The mayor stated that while he did not approve of this confusion of issues, he would be guided by the result of the vote if sufficient names were secured.

At the meeting of the committee on January 14 it was decided to report the ordinances, an abstract of which appears on another page of this issue. Attorney Fisher announced the names of the five trustees who are to reorganize the Union Traction and its subsidiary companies under the name of the Chicago Railways Company, as follows: Charles G. Dawes, A. A. Sprague, Chauncey Keep, Charles H. Hubbard and A. C. Bartlett. Mayor Dunne offered a resolution providing for a referendum petition and providing that if the required number signed the petition no action should be taken on the ordinances until after the election. The resolution was voted down. Alderman Foreman then introduced the resolution before mentioned. At the meeting of the council the following night the ordinances were introduced. The Foreman resolution was adopted after a sharp debate by a vote of 55 to 12, which indicates sufficient strength in the council to pass the ordinance over the mayor's veto if necessary. One hundred thousand copies of the petition were ordered printed and circulated.

The matter will therefore lie in abeyance until the result of the petition is ascertained, although the radical element will probably carry on an active campaign for the adoption of various amendments by the council before the measures are finally passed. Mayor Dunne on January 17 came out with an announcement of his candidacy for re-election with the traction issue as his platform, advocating amendments authorizing the issue of at least \$25,000,000 additional Mueller certificates; guaranteeing that the city's profits shall not fall below a certain per cent of the gross receipts; giving an outside company the right to take over the lines by giving three-cent fares in lieu of a 20-per cent bonus; and eliminating the contractor's profit when subcontracts are let.

Cleveland Traction Developments.

The decision of the United States supreme court on January 7, holding that the Cleveland Electric franchises in Central avenue and Quincy street had expired in 1905, followed by the decision of Judge Babcock on January 10 that the Low Fare Railway Company's franchise in Sumner avenue is valid, has changed the entire aspect of the Cleveland street railway controversy and negotiations are now being made looking to a settlement of the problem according to the plan proposed by Mayor Johnson to lease the Cleveland Electric property to a holding company.

The proposition of the Cleveland Electric company submitted to the city council on January 10, to continue to operate the Central avenue and Quincy street lines on the basis of three-cent fares, all surplus of receipts over cost of operation to go to the city until the question of new franchises can be settled, was followed by other propositions from the Municipal Traction Company and the Low Fare Railway Company. The Municipal company offered to lease the Cleveland Electric property on the same terms on which it now operates the Forest City Railway, i. e., paying 5 per cent interest on the stock representing the actual value of the property, and, in case such a plan is approved by the council, to confer with President Andrews in regard to the valuation. The Low Fare company offered to operate the Central avenue and Quincy street lines at a three-cent fare, paying the Cleveland Electric company a rental for the use of its property or buying it outright, at valuation to be agreed upon by the parties concerned.

On Friday morning, January 11, President Andrews of the

Cleveland Electric and President Du Pont of the Municipal company met and agreed upon a thirty-day armistice, during which neither side should take any action on the offensive; the injunctions restraining the operation of Forest City cars should be lifted; proceedings in various suits brought by the Cleveland Electric, particularly the "financial interest" case, should be postponed, and the Forest City should do no construction work. This agreement was ratified at an informal meeting of the council that afternoon, as was the Cleveland Electric's plan for operating the Central and Quincy lines. A resolution was also adopted approving the proposition of the Cleveland Electric company to submit to the determination of A. B. Du Pont and D. J. Davies, secretary of the Cleveland Electric company, the question of the compensation to be paid to the city by the company for its occupancy of Quincy avenue and Central streets since March, 1905. The chairman of the street railroad committee was authorized to introduce such a resolution into the council for its official action. Another resolution was adopted stating that it was the sense of the meeting that an immediate settlement of the whole street railway situation would give to all the people of Cleveland the benefits of low fare, and recommending to the Cleveland Electric company, as a basis of such a settlement, the immediate consideration of the leasing proposition of the Municipal company, as embodying the best suggestion thus far made for dealing comprehensively with the entire question. The company was requested to inform the council at its next meeting of its attitude to the suggestion or of any other plan it might desire to submit.

On the morning of January 12, the Forest City cars ran to the Public Square, at a three-cent fare, and the Cleveland Electric cars in Quincy avenue and Central street were also operated at a three-cent fare.

At the council meeting on Monday, January 14, the resolutions approving the plan for determining the compensation to be paid to the city by the old company, and recommending the holding company plan, were formally adopted.

A communication was received from the Cleveland Electric company stating its willingness to consider the leasing proposition. After stating that the offer of the company to accept a franchise on the basis of seven tickets for a quarter and universal transfers is still open, the letter says that in the judgment of the company the system cannot be operated at a less rate of fare with transfers, properly maintaining the property and giving such service as the public has a right to demand. The company also says it would be glad to have its proposition submitted to a vote of the people. In regard to the holding plan it says:

"The company, however, realizes the existence of a general public sentiment in favor of the settlement of the long drawn out controversy on the subject of the operation of street railways in this city and if, in your judgment, it is not in the public interest to settle the matter by granting to this company a franchise upon the lines above referred to, we are, of course, willing to consider propositions or suggestions along other lines; and if, as we understand the action of your body last Friday, it is your wish that we do so, this company will give careful business consideration to a proposition for a lease of its property and franchises to some other company, together with an option to the city to purchase, and to this end our president will be glad to confer with Mr. Du Pont."

The communication was referred to the street railway committee.

In its offer to lease the Cleveland Electric property the Municipal company agreed to make such changes in its personnel as shall meet the approval of all concerned. The full details of the plan, as explained by Mayor Johnson, contemplate that the holding company shall consist of public-spirited citizens who shall represent the interests of both the investors and the city, and who shall have no financial interest in the result. It is proposed to reorganize the stock of the Cleveland Electric so that it shall represent the actual value of the physical property plus the appraised value of the franchises and to pay a 6 per cent rental on that amount plus one-ninth, with a provision for ultimate redemption of the stock at 110. It is proposed to lease the property to the holding company for a certain term of years, to be operated at a three-cent fare. The old company, however, is to be given a "security franchise" providing for a higher rate of fare, under which the company can step in and operate in case of default by the leasing company.

Bills to Permit City Railway Companies to Own Interurbans.

Bills have been introduced into both houses of the Nebraska legislature to give city electric railway companies the right to own interurban lines. At present this is prohibited.

Bill to Provide Vestibules.

A. R. Parker, of Ft. Wayne, Ind., has introduced into the state legislature a bill to compel street railway companies to equip the forward ends of their cars with vestibules for the protection of the motormen, between April 15 and November 15.

Wages for Extra Employees.—The Rhode Island Company, of Providence, R. I., has announced a new system of paying its extra conductors and motormen, whereby such men will be paid a minimum wage of \$1.50 per day if they work only part of the day, and will receive full pay for a full day's work.

Mayor Asks for Municipal Low-Fare Railway.—Mayor Fagan, of Jersey City, N. J., has addressed a message to the city street and water board, in which he recommended the building of an experimental three-cent fare street railway line, either by the city or by a private contractor under the control of the city. The mayor also enclosed a draft of an ordinance requiring the Public Service Corporation of New Jersey to operate sufficient cars that

every passenger may be provided with a seat and that passengers desiring transportation shall not have to wait more than five minutes for a car.

Interurban to Carry Mail.—The Bloomington Pontiac & Joliet Electric Railway has been awarded a contract for the carrying of United States mail on its line between Dwight and Odell, Ill. Under the new arrangement it is said that Chicago mail will arrive at Odell at 7 a. m., instead of at noon as at present.

Central Passenger Association Lines May Interchange with Electrics.—The members of the Central Passenger Association at a recent meeting agreed to withdraw the understanding which has prevailed for some time; that the steam roads were not to make prorating arrangements with the electrics. This leaves each steam line free to make such arrangements as it may desire.

Development of the Chicago Edison & Commonwealth Electric Systems.—At the annual meeting of the electrical section of the Western Society of Engineers held on January 11, Mr. Ernest F. Smith, superintendent of substations for these companies, delivered an interesting address on the development and operation of the large transmission and conversion system of the Chicago Edison and Commonwealth Electric companies.

International Tramway Union.—Mr. P. Serstevens, secretary general of the Union Internationale de Tramways et de Chemins de Fer d'Interet Local, announces that the International Tramway Union will publish early in February a detailed account of the proceedings of the congress of the Union held at Milan in September last. This publication will appear in French and German and will comprise about 400 pages, folio. The report will be sent to all members of the association.

Electric Railways and Municipalities.—The address of Hon. Henry J. Booth, Columbus, O., on "The Electric Railway and the Municipality," which was delivered at the annual banquet of the American Street and Interurban Railway Association on the occasion of the Columbus convention, has been reprinted in pamphlet form and is being distributed by Secretary Bernard V. Swenson. The address was published in the daily edition of the Electric Railway Review on October 20, 1906.

Springfield Consolidated Railway Increases Wages.—The Springfield Consolidated Railway Company, of Springfield, Ill., recently announced an increase of wages for its motormen and conductors who have been in the company's service for two years from 18 to 19 cents an hour. The company had previously adopted the plan of giving a uniform free every year to each man who has been in its employ for five years, and a uniform and an overcoat to each man who has been with the company for ten years.

Increased Service on the Illinois Traction System.—The Illinois Traction Company will put into effect on February 1 a new schedule between Springfield and East St. Louis, adding four limited cars. Limited cars will leave each terminal every two hours, from 6 a. m. to 8 p. m. The cars leaving Springfield at 6 a. m., 10 a. m., 2 p. m., and 6 p. m., are the regular "Corn Belt Limited" cars, with buffet service. The time consumed between Springfield and East St. Louis, near the Eads bridge, is 3 hours and 30 minutes. The new schedule is made necessary by the constantly increasing traffic.

Interstate Interurban Association.—The annual meeting of the Interstate Interurban Association, composed of representatives of the electric railways in Illinois and Wisconsin, was held on January 7 at Wheaton, Ill., where the members were the guests of the Aurora Elgin & Chicago Railway Company. L. E. Fisher, general manager Illinois Traction Company, Danville, Ill., was elected president of the association, and C. E. Flenner, auditor Aurora Elgin & Chicago Railway, Wheaton, Ill., was chosen secretary.

Portland Mutual Benefit Association.—The employes of the Portland (Ore.) Railway Light & Power Company recently organized a mutual benefit association, with about 400 members, under the name of the Brotherhood of Electric Railway Employes of the Portland Railway Light & Power Company. The constitution provides for sick and death benefits. The company will soon begin the construction of four clubhouses in various parts of the city, which will be used as meeting places for the association. General Manager F. I. Fuller, of the company, is ex-officio president of the organization and Treasurer S. G. Reed is treasurer.

Boston & Worcester Asks Freight Rights.—Having secured local permits to do a freight and baggage business over its lines in Newton, Marlboro, Wellesey, Natick, Framingham, Westboro, Shrewsbury, Northboro, Southboro and Hudson, Mass., the Boston & Worcester Street Railway has petitioned the state railroad commissioners for approval. The company has several freight cars ready for operation, and it wishes to carry newspapers, agricultural products, baggage and all the usual classes of light freight and express matter, excepting explosives. It agrees not to let the freight business interfere with its passenger service.

Meeting of American Institute of Electrical Engineers.—The annual meeting of the American Institute of Electrical Engineers will be held in the auditorium of the Engineers' building, 33 West Thirty-ninth street, New York, on Friday, January 25, 1907, beginning at 8:15 p. m. Messrs. Lewis B. Stillwell and Henry St. Clair Putnam, consulting engineers, of New York, will present a paper on "Substitution of the Electric Motor for the Steam Locomotive." The paper will include: 1. Presentation of certain facts established by experience in the operation of elevated, subway and interurban lines by electricity. 2. Discussion of comparative cost of operation by steam and electricity applied to railways in operation, and including both passenger and freight service.

3. The importance of standardizing electric railway practice. 4. The question of frequency in the operation of railways by alternating current. Members of the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers, the New York Railroad Club and the Transportation Club have been invited to attend.

Want Speed Limit Raised.—President George T. Dunlop of the Capital Traction Company and Vice-President George H. Harries, of the Washington Railway & Electric Company, Washington, D. C., have jointly sent a letter to the commissioners of the District of Columbia asking that the police regulations be amended to allow street cars to be operated at the rate of 15 miles an hour within the city limits and 20 miles outside of the city. The law now restricts the speed to 12 and 15 miles an hour. The request states that it is not desired to increase the running time between terminals but to prevent the arrest of motormen for occasional bursts of speed.

Green Bay Traction Company Building New Pavilion.—The Green Bay (Wis.) Traction Company has nearly all of the material on the ground for a mammoth new pavilion to be erected at its amusement resort at Ridge Point, Wis. The piling has already been driven at the river bank and active building operations will be started as early as possible in the spring so that the structure will be in readiness for the pleasure seekers early in the season. The new building will be 75 feet wide and 124 feet long, including porches, and will contain a dance floor 50 by 100 feet, as well as a stage. The old pavilion will be allowed to stand and will be used for private parties and various entertainments.

Prizes for Employes' Hours of Service.—Pursuant to a custom inaugurated several years ago, the Nashville Railway & Light Company has awarded cash prizes to its motormen and conductors whose names have been placed on the "honor roll" of the company, which is based upon the number of hours the men have worked during the year. The prizes range in amounts from \$5.00 to \$50. The winner of the first prize for motormen, \$50, had worked 5,502 hours. The second and third prizes were \$40 and \$25, respectively. Ten-dollar prizes were also awarded to all motormen who had made an average of 10 hours a day or over and five-dollar prizes to those making an average of nine hours and over. Similar prizes were awarded to the conductors on the same basis. Of the conductors the winner of the first prize had worked 5,260 hours.

Indiana Engineering Society.—The twenty-seventh convention of the Indiana Engineering Society was held at the Commercial Club, Indianapolis, on January 17, 18 and 19. The program included several papers discussing railway subjects, among which were the following:

Engineering of Interurban Railway Construction. Robert P. Woods, Indianapolis, Ind.

Report of Committee on Electric Railways. J. P. Moore, Indianapolis, Ind.

Paving Between Street Car Tracks and Rails. B. J. T. Jeup, Indianapolis, Ind.

The Work of the State Railroad Commission. Union B. Hunt. Advantages of Electric Inspection. F. R. Daniel, Indianapolis, Ind.

Electric Car Braking. Prof. H. T. Plumb, Lafayette, Ind.

Improvement of Big Island Park by the Twin City Rapid Transit Company.—The Twin City Rapid Transit Company, of Minneapolis, has announced elaborate plans for the improvement of Big Island Park, on Lake Minnetonka, which it is expected will be ready for formal opening on Decoration Day. Big Island Park contains 65 acres, which will be converted by landscape artists into a beautiful picnic ground and amusement resort. Besides the usual amusement features, such as a roller coaster, merry-go-round, etc., a large casino seating 1,500 persons will be erected, and excellent band concerts are to be offered. A large dancing pavilion, an electrically-lighted tower 200 feet high, and four kitchens with fires maintained by the company for picnic purposes are also included. The architecture of the buildings is to be of the Spanish mission style. A large force of workmen is now engaged on the improvements. Three large ferry boats, with a capacity for 1,000 passengers each, will be operated on Lake Minnetonka, with three excursion boats and six express boats to accommodate the cottage resorts on the lake.

Annual Meeting of American Forestry Association.—The American Forestry Association held its annual meeting at Washington, D. C., on January 9. The report of the board of directors described the progress of forestry—national, state, and private—during the preceding year, and recorded the growth made by the association. It was brought out that in the entire history of the forest movement the year 1906 has been the most notable, especially in the very rapid expansion of national forest work, in the increased activity of states in forestry, in advantageous forest legislation, in the strengthening of forest education, and in the increase, both of membership and in activity, of the American Forestry Association. During the year the association had again given special attention to the promotion of legislation, looking to the establishment of national forest reserves in the White Mountains and the Southern Appalachians. The promotion of legislation for the establishment of a wood-testing laboratory in connection with the Forest Service was also strongly recommended in the report. Interesting addresses were given by Dr. Edward Everett Hale on the need of forest preservation; by J. B. Blades, of New Bern, N. C., voicing the strong desire of the people of his section for the Southern Appalachian Forest Reserve.

Construction News

FRANCHISES.

by Prof. Henry S. Graves, director of the Yale Forestry School, on the progress of forest education; by Enos A. Mills, of Colorado, on the marked change in sentiment in favor of the forest reserves by the people of the west upon a better acquaintance with their purposes and administration, and by George K. Smith, secretary of the National Lumber Manufacturers' Association, on the cooperation in forest work by the lumber associations.

International Exposition of Safety Devices.—Space is now being assigned for the exhibits of the first International Exposition of Safety Devices, to be held at the American Museum of Natural History, New York City, beginning January 29, 1907, and continuing two weeks. The exhibits will include safety devices for wood and metal-working machinery; stamping, grinding and polishing machines; safeguards for boilers, elevators, windlasses, cranes and hoisting machinery; textiles and building trades; safety lamps and explosives; quarrying and agriculture; chemical industries, safety from fire; railway and trolley safety. It is earnestly desired that all those wishing to exhibit safety devices in any of the above classes should apply at once to W. H. Tolman, director, 257 Fourth avenue, New York, for space. The object of this exposition is to awaken the American public to the necessity of doing something to lessen the causes of accidents to American life and labor by means of a permanent Museum of Safety Devices, where all problems of safeguarding life and limb can be studied in their working details. There will be no charge for space.

Bill to Regulate Street Railways in District of Columbia.—United States Representative William B. Madden, of Illinois, has introduced in Congress a bill providing that every street railroad operating in the District of Columbia shall give free continuous transfers good on all intersecting lines to all points within the District; shall sell 25 tickets for a dollar good for a ride to any point in the District, and shall run cars at least every five minutes between 6 a. m. and 1 a. m., and every thirty minutes between 1 a. m. and 6 a. m., on all lines within the District. The question of universal transfers was discussed by officers of the Capital Traction Company and the Washington Railway & Electric Company at a hearing before the District Commissioners on January 11. Vice-President George H. Harries, of the latter company, said that in no city in the United States is there a universal transfer system that enables passengers to use the lines of two distinct companies on a transfer issued by either company. President George T. Dunlop, of the Capital Traction Company, said the plan would open the way to great abuse of the transfer privilege and that the stockholders would suffer thereby.

Number of Cars Entering Indianapolis in 1906.—The Indianapolis Traction & Terminal Company made its annual settlement with the city of Indianapolis on January 8 for the use of the streets by the interurban cars which use its tracks. The company pays the city 4 cents for each round trip made by an interurban car. The report shows that there were 57,730½ round trips in 1906 made by the various companies, as follows:

Indiana Union Traction Company—	
Muncie division	8,640
Logansport division	7,894
Broad Ripple division	13,539
Army Post Division	2,557
Indianapolis & Cincinnati Traction Company—	
Shelbyville division	7,460
Rushville division	7,306½
Indianapolis & Northwestern	8,405
Indianapolis & Eastern	7,549½
Indianapolis Columbus & Southern	9,889½
Indianapolis & Martinsville	6,943½
Indianapolis Coal Traction Company	6,557½
Indianapolis & Western	889
Total	57,730½

The Indianapolis & Western is a new road and did not operate through the entire year. The number of round trips in 1905 was 83,150. Estimating that each car carried an average of 30 passengers the number of passengers carried each way was 2,631,900.

Annual Meeting Central Electric Railway Association. Secretary Millholland has announced the program for the first annual meeting of the Central Electric Railway Association which will be held at the Caypool Hotel, Indianapolis, on January 24. A list of the subjects follows:

- Cost of Power for Rental Purposes (Discussion)
- Developing a Demand for Renting Power Does It Pay? G. H. Kelley, Anderson, Ind.
- The Model Car for Long Travel W. H. Evans, Indianapolis, Ind.
- Car Lighting R. C. Taylor, Anderson, Ind.
- Handling of Accidents and Claims E. C. Carpenter, Anderson, Ind.

The program will be followed by the annual election of officers. At 8:30 p. m. the formal banquet will be held as formerly announced.

Through the courtesy of the Indianapolis & Cincinnati Traction Company a special excursion train will leave the terminal station at 9 a. m. and after making a trip over this inter-city single-track road will return to the terminal station at 1 p. m.

Through the courtesy of President Selig it is expected that there will be a large number of private cars in exhibition on Kentucky avenue opposite the Caypool Hotel.

The many attractive features of this annual session should warrant an especially large number of members and guests making special efforts to attend.

Annapolis, Md.—Franchises to build an electric railway in Annapolis have been granted to the Washington Baltimore & Annapolis Electric Railway, the Maryland Electric Railroad and the Annapolis Short Line, which embody the following provisions: The company shall be required to pay a tax of 35 cents per foot of track; cars shall be limited to 40 feet in length, run at intervals of 15 minutes and at a speed of not over 10 miles an hour, and the road shall be in operation by July 1, 1908.

Chattanooga, Tenn.—S. W. Devine has been granted a franchise for an interurban electric road which he proposes to build from this city to Chickamauga, Catoosa Springs, Crawfish Springs, Lafayette, Spring Place and other points in Georgia. It is stated that he is backed by eastern capitalists and that work will be started in the near future.

Columbia, Tenn.—Horace Rainey, of Columbia, representing a company of Maury county capitalists, has applied for a franchise for an electric railway from Columbia to Mt. Pleasant.

Darlington, Wis.—The Dubuque-Madison Electric Railroad, which will serve the lead and zinc mining districts of Wisconsin, has applied for a franchise in this city. A. L. Dewar, Chicago, president; J. C. Winship, Chicago, first vice-president; C. W. Tostevin, secretary and treasurer; W. H. Winter, general manager; P. H. Conley, general counsel. William C. Newberry, Winnetka, Ill., is also interested.

Dayton, O.—The city council has granted The City Railway a franchise for extensions on various streets of the city. T. E. Howell, superintendent.

Duluth, Minn.—The Northern Traction Company has asked for a franchise to build and operate an electric railway on certain county highways on the Mesaba range. President R. F. Berdie, Hibbing, Minn., states that grading has already been started on a line from Hibbing to Virginia, Minn.

Enid, Okla.—C. H. Bosler, Dayton, O., has been granted a franchise to build an electric railway in Enid. By the provisions of the franchise work is to be started in 10 days and four miles of track shall be completed in six months. A portion of the material on hand at Tulsa, I. T., where Mr. Bosler is constructing an electric line, it is stated, will be shipped to Enid. A certified check for \$20,000 has been deposited as a guarantee that the line will be built.

Hammond, Ind.—It is stated that the Calumet Electric Street Railway is about to apply to the city council for a franchise to extend its line from a point just west of Robey to Hammond.

Kansas City, Mo.—A franchise has been granted to the Metropolitan Street Railway for a line on Twenty-fourth street, from Jackson avenue to Brighton street.

Lincoln, Neb.—The Citizens' Railway has been granted a franchise for extending its lines into the north and south sections of the city.

Manitou, Colo.—Franchise rights for a street railway in Manitou, to extend to Crystal Park, have been granted to W. C. Dotterer and Wesley Compton, representatives of the eastern syndicate backing the project. The road, which will cost in the neighborhood of \$250,000, must be completed and put in operation within two years, according to the franchise, which has a life of 25 years. It is understood that the new electric railway will utilize the old roadbed built 25 years ago for a projected steam line to the summit of Pike's Peak via Crystal Park. Power for the road will be secured from the Pike's Peak Hydro-Electric Company.

Norman, Okla.—The city council has granted a franchise over several streets to the Tecumseh Guthrie & Norman Interurban Electric Railway.

North Birmingham, Ala.—The Tidewater Development Company which proposes to build from Gadsden to Tuscaloosa, Ala., has applied for a franchise for the full length of Twenty-ninth and Twenty-sixth streets.

North Yakima, Wash.—T. A. Noble, representing Frederick Elmendorf, of Spokane, has applied for a franchise for an electric railway to the Mexico valley through Union Gap to a point some distance below the intake of the Sunnyvale canal. Also, for a separate franchise to build a road to the Altamira valley as far as Oak Springs.

Oakland, Cal.—The city council has granted a franchise to the Oakland Traction Consolidated for a line in Claremont avenue.

Richmond, Cal.—A franchise has been granted to W. S. Reelin for an electric railway on Eleventh avenue.

Rochester, Ill.—The Springfield Clear Lake & Rochester Railway Company has been granted a franchise to build an electric line on Main street.

St. Charles, Ill.—The Aurora Elgin & Chicago Railway has applied for a five-year extension to its present franchise with the privilege of hauling freight through the streets from 10 o'clock at night to 9 o'clock in the morning. It returns 15¢ when it agrees to pay one-third of the expense of building the proposed

Fifth street viaduct, the Chicago Great Western Railway to pay the other two-thirds.

San Diego, Cal.—The East Side Railway has applied for a franchise on El Cajon avenue or University boulevard from Thirtieth street to the east line of the city limits.

San Luis Obispo, Cal.—The board of supervisors has granted a franchise to J. L. Beckett to construct an electric railway in San Luis Obispo county.

Schenectady, N. Y.—A special committee of the city council has approved eight of the twelve franchise grants applied for by the Schenectady Railway last October. Several restrictions in the way of reduced fares and improvements to streets are included in the report.

South Bend, Ind.—A franchise has been granted to the Goshen South Bend & Chicago Railroad for a line through St. Joseph county.

Springfield, Ill.—The Coal Belt Electric Railroad Company has been granted by the state board of railroad and warehouse commissioners permission to construct a grade crossing with the Illinois Central line at Herrin, Ill., to be protected by interlocking switch.

Toronto Railway.—Manager J. R. Fleming is quoted as saying that the company will apply to the city council before the end of January for permission to construct a line of railway up Bay and Terulay streets to College street; also for a line up York street to University avenue, past the Parliament buildings and through Queen's Park to Avenue road.

Tulsa, I. T.—It is stated that a franchise will soon be applied for by Tulsa capitalists to build a line connecting this city with the Glenn oil pool. The plan includes the use of the Midland Valley tracks to Jenks and from there to the pool, a distance of four miles, independent tracks are to be built. Switches for facilitating the transportation of supplies will be built over the pool and it is said that cars will be run every hour.

Tuscaloosa, Ala.—The Tidewater Development Company has been granted a franchise for the construction of a passenger and freight line in this city. The main freight line will enter the city and pass over Third street to the intersection of Queen City avenue where it will branch off in another direction. The passenger line is to be built on Queen City avenue to Sixth, down Sixth to Twenty-eighth avenue and up Twenty-eighth to the main line again. One year in which to begin the work and three years for its completion are allowed by the terms of the franchise. J. M. Dewberry, Birmingham, Ala., is president.

INCORPORATIONS.

Canandaigua Southern Electric Railroad.—Incorporated to build an electric road 33 1/3 miles long from Canandaigua to Atlanta, Ontario county, N. Y. Capital, \$1,000,000. Directors: E. G. Hayes, Alexander Davidson, George W. Hamlin, Canandaigua, and H. C. Hatch, Atlanta, N. Y.

Chicago City Railroad Company.—Incorporated at Springfield, Ill., to purchase, lease, construct, maintain and operate street railways in Cook county. Capital stock, \$100,000. Directors: Edward Morris, T. E. Mitten and J. P. Wilson. Mr. Wilson owns \$30,000 and his associates \$35,000 each of the capital stock, half of which is paid in. The license to incorporate was issued to R. B. Hamilton, John R. Davies and Robert N. Seney.

Decatur Taylorville & Litchfield Traction Company.—Incorporated to build an electric line from Decatur to Litchfield; principal office, Chicago. Capital stock, \$5,000. Incorporators: Dudley Taylor, Frederick W. Job, Thomas B. O'Connell, Alma L. Dorothy and W. W. Taylor.

Duquoin Rapid Transit Company.—This company has filed articles for an amended charter to change its name to the Duquoin Belleville & St. Louis Electric Railway Company.

Friendship Avenue Street Railway.—Incorporated at Harrisburg, Pa., to build 4.5 miles of street railways in Pittsburg beginning at Liberty avenue and Denny street, Denny to Mifflin, to Fortieth, to Main, to Mifflin, to Carroll, to Edmonds, to Friendship to St. Clair, to Baum and return by the same route. This line will be a feeder for the elevated lines which the M. J. Hosack interests are promoting. Capital stock, \$27,000. M. J. Hosack, Roger Knox, James M. Magee, Charles K. Robinson and W. D. McBryar are the directors.

Iowa & Northwestern Railway.—Incorporated in Iowa to construct, lease, purchase, equip, maintain, operate and sell railway lines in the United States, either steam, electric or other motive power, but especially to construct an electric line from Waterloo, Ia., to points on the Mississippi river to be determined later. Capital stock, \$100,000. Stephen B. Howard, president; Edward M. Rice, first-president; Edward C. Luther, secretary and treasurer.

Linden Avenue Street Railway Company.—Incorporated in Harrisburg, Pa., to build 2.5 miles of street railways in Pittsburg from Neville and Bayard streets, out Bayard to Amberson, to Westminster, to Pitcairn, to Fifth avenue and across to Wilkins avenue, to Beechwood boulevard, to Linden, to Thomas, to Brad-dock, to Susquehanna, to Pitt or Dunbar street and return by the same route. This will be a feeder to the proposed elevated lines of the M. J. Hosack interests, whose applications for charters will be renewed shortly. Capital stock, \$15,000. Directors, M. J. Hosack, Roger Knox, James M. Magee, Charles K. Robinson and W. D. McBryar.

Montgomery Fresno & Eastern Railway.—Incorporated in Cali-

fornia to build an electric railway from Monterey to Fresno, a distance of about 140 miles. Capital stock, \$15,000. Incorporators: Alfred D. Bowen, G. W. Purcell and H. L. Sanborn, all of San Francisco, and others.

Oklahoma Railway.—Incorporated in Oklahoma to build electric interurban railroads from Shawnee to El Reno and Ft. Reno, from Shawnee to Tecumseh, from Guthrie to Purcell, and from Yukon southwest to Chickasha, a total of 170 miles. Capital stock, \$5,000,000. Incorporators: Frank Wells, O. R. Rittenhouse, G. G. Barnes, J. J. Johnson, Carlos Combs, Fred S. Combs and Edward L. Lawson, all of Oklahoma City.

St. Louis Electric Bridge Company.—Incorporated in Illinois to build a bridge across the Mississippi river at Venice, to give the Illinois Traction Company an entrance to St. Louis. Plans for the bridge have been completed and it is said that application for permission to build it will soon be made to the war department. Capital stock, \$2,500. Incorporators: W. H. Burke, G. A. Wright and George M. Mattis, all associated with the Illinois Traction Company.

Shannonin Street Railway.—Incorporated in Pennsylvania to construct six miles of road in Allegheny county. Capital, \$72,000. President, S. J. Dugan, Coraopolis, Pa.

Sharon Hill & Upper Darby Railway.—Incorporated in Pennsylvania to build a 7-mile electric railway in Delaware county. Capital stock, \$50,000. W. A. Rigg, of Reading, president.

Shenango Street Railway.—Incorporated to build a street railway system in Greenville, Pa. Capital stock, \$12,000. Incorporators: Edwin Ripley, E. C. Emery, W. H. Waugh, E. A. Henry and others, of Greenville.

Swan Creek Railway.—Incorporated in Tennessee to build an electric railway from Mt. Pleasant through Maury and Lewis counties, Tenn., to Weatherly, 17 miles. Capital stock, \$50,000. Incorporators: G. T. Hughes, J. W. Fry, J. A. Smizer, W. W. Dyer and G. W. Killbrew.

Washington Railway & Power Company.—This company has recently been incorporated under the laws of Washington. Its principal office will, early in the summer, be established at Vancouver, Wash., with a branch office in Portland, Ore. Valuable franchises to construct and operate a system of electric cars in Vancouver have been acquired, and in all probability lines will be extended into the country during the year 1907. Vancouver is older than the city of Portland, 12 miles distant by water, yet this electric system will be the pioneer electric railway in Clarke county, Washington. Walter H. Moore, president of the Oregon Trust & Savings Bank, of Portland, is president of the railway company; L. B. French, vice-president; Arthur Langguth, Portland, secretary, and H. C. Phillips, of Vancouver, Wash., treasurer. The construction and equipment are to be up to date, and work on the power plant and track building is to begin about April 1st.

TRACK AND ROADWAY.

Addison, N. Y.—The Tuscarora Valley Traction Company has been granted a certificate of necessity to construct a line from Addison to Woodhull and Jasper, N. Y., 19 miles. C. A. Brewster is interested.

Arnold City Southern Railway.—This company has been organized by Pittsburg capitalists, believed to represent the West Penn Railways Company, of Pittsburg, to build a line from the present terminus of the Monessen trolley line to Connellsville, touching Perryopolis, Star Junction, Flatwoods and Vanderbilt en route. It is said that the company has purchased a right of way from one end of the proposed road to the other. Edmond Englert, Pittsburg, Pa., president.

Augusta & Aiken Electric Railway.—J. A. Wills, chief engineer, Augusta, Ga., writes that this company, which operates a line between Augusta, Ga., and Aiken, S. C., will build an extension, under the name of the Augusta & Columbia Railway, from Aiken to Columbia, S. C., 59 miles, making a total of 86 miles, via Trenton, Batesburg, Leesville and Lexington. Surveys have been completed and right of way has been secured. Grading is to begin in a few months. The overhead construction will be of the catenary type. A 10,000-hp. water power will be developed near Lexington, S. C., and current will be transmitted to Augusta and other points on the line, probably at 50,000 volts. The road from Augusta to Aiken is being straightened and relocated so that no grade will be greater than 1 1/2 per cent, in order to enable a higher speed. It is intended to handle both freight and passenger traffic. William T. Van Brunt, 120 Broadway, New York, is president.

Aurora Elgin & Chicago Railway.—It is reported that this company is contemplating building an extension north from the Carpentersville line to Nunda, Woodstock and other points in McHenry county.

Bayou Teche Railway & Light Company.—President P. M. Schneidau, of New Orleans, La., states that active construction will begin at an early date, as the building materials, which have been delayed, are expected shortly. The road is to connect New Iberia, Franklin, Lafayette, Abbeville and St. Martinsville, La. Surveys have been made.

Bisbee, Ariz.—The Warren Company is asking bids until February 4 for the grading on about five miles of electric line between Bisbee and Warren, Ariz. C. W. Van Dyke, manager, Bisbee.

Black Diamond Electric Railway.—John Schrader, of Chester, W. Va., A. H. Boone, Zanesville, O., and John Bane, Parkersburg,

W. Va., are reported to be back of a plan to revive this project for electric lines in Wheeling, W. Va., Marietta, O., and Parkersburg, W. Va.

Boston Elevated Railway.—This company is acquiring land for the purpose of connecting the southerly end of the new Washington street tunnel and the elevated structure in upper Washington street. Over the land now taken, the company intends to build an inclined structure, carrying its tracks on an easy gradient from the place where they will emerge from the tunnel, at surface level, up above the surface, crossing Oak street, Pine street, Broadway, and intervening private land; and over the steam railroad cut in which run the tracks of the Boston & Albany and New York New Haven & Hartford railroads, to a connection with the present elevated structure at the junction of Motte and Castle streets with Washington street.

Boston & New York Electric Railroad.—This company, whose plans for an electric road from Boston to Providence, R. I., were rejected some time ago by the Massachusetts railroad commission because they were incomplete, has filed a new set of plans showing with minute detail its proposed route from Boston to the Rhode Island state line. A. B. Leach and O. B. Clancy, of Boston, are interested.

Brownsville Masontown & Smithfield Street Railway.—Plans and profiles have been filed for the first 5 miles of this road, which as projected will be 15 miles long, through Masontown, West Masontown, Lambert, New Salem, Smithfield and New Geneva, Pa. W. J. Sheldon, McKeesport, Pa., is interested.

Buffalo & Lake Erie Traction Company.—The work of surveying this line between Buffalo and Dunkirk is progressing rapidly. The line is laid out nearly to Silver Creek, the greater portion being through private right of way.

Buffalo & Rochester Traction Company.—This company has petitioned for the right to construct an electric railway connecting Buffalo, Batavia and Rochester, N. Y. The proposed line will start at Dewey near the southeastern corner of Buffalo and run in an easterly direction through Grimsville, Looneyville, Wendel, Crittenden, Pembroke, Batavia, Stafford, Le Roy, Lime Rock and Caladonia. From this point it will turn north and pass through Mumford, Chili and several smaller towns to its terminal in Genesee street. From there it is stated that it will use the tracks of the Rochester Railway Company to enter the city.

Butte, Mont.—James Brien, of Spokane, Wash., and associates, propose to build an electric railway from Butte to Anaconda, Mont., via Gregson Springs.

Charleston & Summerville Electric Railway.—D. E. Baxter & Co. Inc., 27 William street, New York, which has the entire contract for building this line, has two large construction gangs working from both ends and has completed grading for about five miles and will soon commence track-laying on the finished portions of the grade. G. S. Brantingham, manager of construction for D. E. Baxter & Co., has arranged for prompt delivery of engines, generators, etc., and has been assured by the manufacturers that there will be no delay in delivery. This machinery will be installed in a concrete fireproof building of the most modern design and will be of ample power to operate a first-class passenger and heavy freight service. The road throughout will be of first-class single-track construction with sidings and branch to the new Charleston Navy Yard, thus making direct communication to Charleston and Summerville for government officials and employes. It is expected that this line will be ready for operation by September 1, 1907.

Cincinnati Northern Traction Company.—It is reported that this company, which is laying out a new route between Hamilton and Middletown, O., will build a 750-foot bridge over the Great Miami river just south of Middletown. F. J. J. Sloat, general manager, Hamilton, O.

Citizens' Railway.—This company has recently amended its articles of incorporation, increasing its capital stock to \$1,000,000, to provide for extensions in Lincoln, Neb. During 1906 the company built about 6 miles of track and about 15 miles of extensions are planned for 1907. Materials for 7 miles have been purchased. Charles H. Cox, of Lincoln, is general manager.

Columbus Greensburg & Richmond Traction Company.—Walter McCord, secretary, Richmond, Ind., writes that this company, recently organized, hopes to begin construction by March 1, 1907, on its proposed line from Richmond to Columbus, Ind., 83 miles, via Connersville and Greensburg. August M. Kuhn of Indianapolis, is president.

Columbus Magnetic Springs & Northern Traction Company.—General Manager H. E. Buck is reported to have announced that this company's extension from Magnetic Springs to Richwood, O., six miles, will be completed within 30 days and that cars will be operated on that portion of the road immediately after its completion. Strong gasoline-motor cars will be used. Right of way for the extension of the line north from Richwood to La Itue, 14 miles, has been secured. When this is completed it is stated that cars will enter Columbus either over the Columbus Delaware & Marion Railway or one of the other roads entering Delaware from Columbus. W. S. Galbreath, Pittsburg, president; W. N. Embert, Baltimore, secretary and assistant treasurer; Carl Magee, Pittsburg, treasurer.

Connecticut Railway & Lighting Company.—John E. Sewell, acting general manager, Waterbury, Conn., is reported as having secured the right of way and engineering to the amount of \$200,000 on a contemplated extension of the company's line this year, some of which will be started immediately. \$500,000 of this amount

will be spent in improvements on the Waterbury trolley lines. Among these are included the double-tracking of all the lines in Waterbury, new car barns and possibly a new steam lighting plant for the Bulls Bridge station; also the building of a tunnel under the Highland division of the trolley line to come out on Main street, instead of double-tracking the surface line by way of Maple street. From there a track will be laid in Thomaston avenue to connect with the present track near the Waterville hotel.

Dalton (Pa.) Street Railway.—It is officially announced that this road will be opened for traffic by March 1. The track has been laid the entire distance from North Scranton to Glenburn, Pa., and the rails and ties are on the ground from Glenburn to La Plume. The poles have been set along the entire route. The car barn and power house at Dalton are almost completed.

Des Moines Winterset & Creston Electric Railway.—B. Schreiner, chief engineer, Des Moines, Ia., reports that the largest part of the right of way has been secured for this new line from Des Moines to Winterset and Creston, Ia. Financial arrangements are now being made and it is the intention to begin construction by May 1.

Elizabethtown, Ky.—It is reported that G. J. Lampton, of Louisville, Ky., is interested in a project to build an electric line from Cecilian to Elizabethtown, 25 miles.

Ft. Wayne & Springfield Railway.—At the local elections on January 10 the towns of Washington, Monroe, and Wabash voted against granting subsidies for the construction of an extension of this road from Decatur to Portland, Mo. The road is now in operation between Ft. Wayne and Decatur. W. H. Flodderjohann, president, Decatur, Ind.

Ft. William, Ont.—This town will soon call for bids for construction and supplies for an extension of seven miles to its municipal street railway system, to cost about \$83,000. A. McNaughton, clerk.

Geneva Waterloo Seneca Falls & Cayuga Lake Traction Company.—An official of this company states that the purpose of the recent decision to increase the capital stock from \$450,000 to \$1,000,000 and to issue a mortgage for \$1,000,000 is to extend the road from Seneca Falls to Auburn, N. Y. The road now connects Geneva and Seneca Falls. The surveys between Seneca Falls and Auburn were completed from three to five years ago, by Westinghouse, Church, Kerr & Co., and the company, with the issuance of the new securities, will be ready to begin the extension work without delay. One of the engineering features will be the construction of a bridge a mile in length, across Cayuga lake, a short distance south of the present New York Central bridge. W. C. Gray, general manager, Seneca Falls, N. Y.

Grafton (W. Va.) Electric Railway.—Contracts for constructing a 2½ mile extension will be let about March 1.

Grand Rapids, Mich.—The W. A. Cullen Construction Company, 25 Broad street, New York, has been awarded a contract for the construction of four new lines in southern Michigan, as follows: Grand Rapids & Ionia Railway, connecting Grand Rapids, Cascade, Lowell, Saranac and Ionia, 33 miles; the Grand Rapids Belding & Greenville, 20 miles; the Ionia & Owosso Railway, connecting Ionia, Lyons, Mulr, Pewamo, Fowler, St. John and Owosso, 48 miles; the Owosso & Pontiac Railway, 50 miles. A surety bond of \$100,000 has been filed to assure the completion of the contract, which provides that the four lines must be fully equipped for service by November 1, 1908. E. M. Hopkins, of Detroit, Mich., is president of the companies, and Robert E. Kline, Dayton, O., is engineer in chief.

Grand Valley Railway (Brantford, Ont.)—This company, now in operation between Brantford and Galt, Ont., and which holds a charter for an extension from Brantford to Woodstock, will apply for a charter for a line from Woodstock to London. It is stated that the first extension will be built this year. A. J. Pattison, Jr., Brantford, general manager.

Great Northern Railway.—James J. Hill, president, is quoted as saying that the plan of electrifying the Cascade tunnel, in the Cascade mountains, is near to realization, and that two large electric locomotives are under construction for use in the tunnel. The bore of the tunnel is 13,000 feet long and it is expected that the use of electricity, by eliminating smoke and gases, will permit of trains being run through it more frequently.

Hagerstown (Md.) Railway.—It is reported that this company has obtained an option on the Potomac River bridge on the Norfolk & Western Railway at Shepherdstown, to be used in building an electric railway from Hoomsboro, Washington county, to Shepherdstown, via Keedysville, Sharpsburg, and Antietam battlefield, a distance of 10 miles. W. C. Hepperle, general manager, Hagerstown, Md.

Houghton County Street Railway.—It is reported that this company, which connects Houghton, Hancock, and Lake Linden, Mich., is soon to prepare plans for the extension of its Wolverine line north to the mines at Alloway and Ahmeek. W. H. McGrath, manager, Houghton, Mich.

Illinois Traction Company.—After the recent monthly meeting of the officials of this company at Springfield, it was announced that work would be started on the construction of the line from Springfield to Jacksonville, 33 miles, as soon as the weather will permit. L. E. Flecher, general manager, Danville, Ill.

Indiana Columbus & Eastern Traction Company.—The city engineer of Columbus, O., has reported this company to double-track the Mound street line over which the cars of the eastern division enter the city. The city proposes to let a contract for

paving the street in the spring and wishes the double track before paving is commenced.

Jackson (Tenn.) Railway & Light Company.—This company is extending its track across Deer river to Bemis, a distance of 3 miles, and is building another extension to East Jackson, $1\frac{1}{4}$ miles. The company recently completed a $1\frac{1}{2}$ -mile extension to North Royal and a $\frac{1}{2}$ -mile extension of the Harlem avenue line to Hicksville. S. S. Bush, Louisville, Ky., vice-president and general manager.

Kalamazoo Elkhart & South Bend Railroad.—The Westinghouse Electric & Manufacturing Company is preparing plans, specifications and estimates on contracts for the complete electrical equipment and construction of the Kalamazoo Elkhart & South Bend Railroad Company for submission to promoters and capitalists interested in the enterprise. No details of the plans nor the figures of the estimates are disclosed nor will be until contracts are approved and executed. It is stated that arrangements for financing the road by Cleveland and New York capitalists are nearly completed. A. D. Harris, South Bend, Ind., president.

Kalamazoo Lake Shore & Chicago Traction Company.—James Grant secretary and manager, Kalamazoo, Mich., writes that 22 miles of track were laid last year on the proposed line from Kalamazoo to South Haven, Mich., 54 miles. This portion is being operated by steam temporarily. $7\frac{1}{2}$ miles have been graded, from South Haven to Packard. S. J. Dunkley, of Kalamazoo, is president; J. T. Lockwood, of Toledo, O., is chief engineer.

Kennett, Del.—George D. Dodge is soon to begin surveys for an electric line between Kennett and Coatesville, which will be a connecting link in the line between Wilmington and Lancaster.

Lafayette & Hoopston Interurban Railway.—Surveys have been completed and right of way secured for this proposed line from Lafayette to Hoopston, Ind., 40 miles. I. E. Switzer, Otterbein, Ind., is president.

Lake Erie Bowling Green & Napoleon Railway.—At a recent meeting of the stockholders plans were discussed for the extension of this road, which now connects Bowling Green and Woodville, O., west through Wood county and either Henry or Defiance county. D. B. Whipple, of Bowling Green, is president.

Lake Shore Electric Railway.—President E. W. Moore, Cleveland, O., has announced that the line from Fremont to Fostoria, O., which will connect the Lake Shore and Western Ohio systems, and considerably shorten the distance between Cleveland and Dayton, will be built this year.

Lancaster (O.) Traction & Power Company.—At the recent annual meeting of this company, a consolidation of the Lancaster Traction Company and the Fairfield Traction Company, plans were considered for building a line to Buckeye Lake, 8 miles, and also a line to Logan. The company is closely associated with the Columbus Railway & Light Company. The following officers were elected: President, Henry B. Peters; vice-president, Andrew Bauman; secretary-treasurer, Philip R. Peters, all of Lancaster, O.

Lewiston & Southeastern Electric Railway.—It is stated that as soon as the weather will permit active work will be resumed on the construction of this road from Lewiston to Grangeville, Idaho. From Lewiston the road will follow the Snake river to a point about opposite Asotin. From there it will climb to the prairie and cross the country into Grangeville, tapping several small towns en route. A branch line is to be run to Nez Perce. Considerable grading and heavy cut work was done last summer and fall, when inclement weather put a stop to operations. Since then it is reported that the road has been completely financed. The permanent survey of the route has been practically completed. Judson Spofford, general manager, Lewiston, Idaho.

Louisville & Eastern Railroad.—President Percival Moore, Louisville, Ky., has announced that the contract for the construction of the extension from Beechwood, 8 miles east of Louisville, to Shelbyville, Ky., 23 miles, has been let to W. L. Love, of Indianapolis. The cost is estimated at \$500,000 and the contract is to be completed by October, 1907.

Louisville Railway.—It is stated that this road will extend its West End Broadway line from Shawnee Park to Riverview, Ky., one-half mile, which will make a through line to the "White City," a new pleasure resort.

Metropolitan Street Railway (Kansas City, Mo.)—This company has made a proposition to the city of Kansas City to build a combined tunnel and viaduct connecting Kansas City, Mo., and Kansas City, Kan., in return for an extension of its franchise, or it will join with the city in paying for a tunnel and viaduct of a width to accommodate wagons.

Mt. Vernon, O.—Dr. Schrontz, of Martinsburg and Ed. Dever, of Mt. Vernon, O., report success in securing right of way for the proposed electric line from Loudonville to Newark, via Mt. Vernon.

Nashville & Chattanooga Electric Railway.—This company is making surveys for an electric railway line from Nashville to Chattanooga, Tenn. C. H. Fisk, of Detroit, Mich., is at the head of a syndicate which is backing the project.

New Orleans & Baton Rouge Railroad.—H. V. Meily, right of way agent for this company, which proposes to build an electric railway from New Orleans to Baton Rouge, La., states that construction work will begin during the month of February, if there is no further delay in securing the rails. Eighty-pound rails are to be used. Edward Godschaux, of New Orleans, president.

New York Auburn & Lansing Railroad.—H. A. Clark, chief engineer, Auburn, N. Y., writes that 20 miles of track were laid

last year, from Auburn to Genoa, N. Y., and that an extension from Genoa to Ithaca, 20 miles, is in progress. The road is now being operated for freight service by steam, but when completed next summer will be operated by third rail.

New York City Railway.—President H. H. Vreeland has announced in a letter to the rapid transit commission that the company has decided to do away with the horse cars now operating in several parts of the borough of Manhattan and to substitute the underground trolley system. Work is to be started as soon as the frost is out of the ground.

Niagara St. Catharines & Toronto Railway.—This company, which last year extended its road to Fonthill, Ont., has awarded a contract to Joseph Battle, of Thorold, Ont., for extending the line from Fonthill to Welland, five miles. Surveys are also being made for a line from St. Catharines, Ont., to Niagara-on-the-Lake, 12 miles. E. F. Seixas, general manager, St. Catharines.

Nagasaki, Japan.—The early construction of three electric tramways in the northern portion of the Japanese island of Kyushu is under contemplation. The first, from Moji to Kokura, 8 miles; estimated cost \$350,000; the second, from Moji to Yawata, 12 miles; cost \$500,000; the third, one of 23 miles, between the important towns of Fukuoka and Kokura; estimated cost \$1,250,000 gold.

Norfolk & Portsmouth Traction Company.—The directors have approved the plans of General Manager Hathaway for extensive track improvements on terminal facilities at the Jamestown exposition grounds. The changes, however, are subject to the approval of the exposition authorities.

Northern Electric Company.—This company, which is building a system of electric roads in Central California, has commenced grading operations at Meridian, on the Marysville-Colusa division. This line will connect at Colusa with another running north to Hamilton City and Red Bluff. Grading has also been started on the Chico-Red Bluff division. A. D. Schindler, general manager, Chico, Cal.

Oklahoma City Railway.—Vice-president J. W. Shartel has announced that during the year 5 miles of extensions to the city lines will be built and a large part of the system will be double-tracked. During 1906 the mileage has been increased from 16.1 to 22.5 miles, with 10.5 miles under construction. It is planned to build a line about 10 miles long toward Shawnee.

Omaha & Council Bluffs Street Railway Company.—It is announced that this company contemplates an extension to its present line by which Omaha and Plattsmouth, Neb., will be connected. The line will be 25 miles long, 15 miles of which are already built to Ft. Crook. A bridge over the Platt river will be a feature of the new line.

Omaha & Nebraska Central Railway.—The Westinghouse Electrical & Manufacturing Company is preparing plans and estimates for the complete electrical construction and equipment of this proposed line from Omaha to Hastings, Neb. J. C. Kinsler, of Omaha, is one of the promoters.

Pittsburg McKeesport & Greensburg Electric Railway.—We are advised by P. A. Meyer, chief engineer, Greensburg, Pa., that this company will build an extension from Hunker to Scottsdale, Pa., $10\frac{1}{2}$ miles.

Portland & Brunswick Street Railway.—Superintendent A. F. Gerald, of Fairfield, Me., has announced that this company will soon commence building an extension from Lisbon Falls via Durham to Freeport, Me.

Portsmouth (O.) Street Railroad & Light Company.—This company has about completed laying steel for a $4\frac{1}{2}$ -mile loop extension to its lines. Seventy-pound 7-inch rails are being laid.

Povidence & Burrillville Street Railway.—It is stated that the New York New Haven & Hartford Railroad, which recently acquired this property, will expend about \$75,000 in completing the double-tracking between Providence and Woonsocket, R. I. Willard Kent, chief engineer, Woonsocket.

Presidio & Ferries Railroad.—President George A. Newhall, of San Francisco, Cal., has announced that the portion of the road between Steiner and Polk streets, San Francisco, would be in operation inside of two weeks, and that the road would be in operation from Polk street to the ferry in three months.

Ridgway & St. Mary's Street Railway.—W. H. Tens, secretary, St. Mary's, Pa., writes that grading is to begin in April on this proposed road from Ridgway to St. Mary's, Pa., 17 miles, via Centerville and Dagus Mines. Gas-engine motor cars are to be used. W. T. Hoblitzell, president, Meyersdale, Pa.; J. J. Hoblitzell, Jr., chief engineer, Meyersdale, Pa.

Selinsgrove & Freeburg Electric Railway.—Secretary George W. Wagenseller, Middleburg, Pa., writes that this road will extend from Selinsgrove to Freeburg, Pa., 5 miles, via Kantz. E. M. Leader, Shamokin, Pa., president.

South Dakota Central Railway.—Surveys will be commenced at once for this proposed line from Rutland, N. D., to Brookings, S. D. W. J. Wagner, of Sioux Falls, S. D., is chief engineer.

Southwestern Traction Company.—This company has let a contract to the Canadian Westinghouse Company for replacing the present Ganz three-phase alternating-current system by the direct-current system. The road connects London and St. Thomas, Ont., and is extending to Port Stanley. S. Walter Mower, London, Ont., general manager.

Springfield & Southeastern Traction Company.—A contract for

the construction of this line from Springfield to Pana, Ill., has been let to the New Orleans Construction Company, of which J. J. Finn, of Decatur, Ill., is president.

Spokane & Inland Railway.—The contract for the extension of this line from Palouse, Wash., to Moscow, Idaho, has been awarded to Grant, Smith & Co., of Spokane, Wash., who also had the contract for the work between Spokane and Palouse.

Thermopolis & Hot Springs Street Car Company.—This company, it is reported, has been organized in Thermopolis, Wyo., with \$50,000 capital stock and has secured a franchise for a street railway line in Thermopolis and to the hot springs near the city.

Toledo & Indiana Railway.—This company has completed arrangements for the extension of its line westward from Bryan, O., to Waterloo, Ind., where it will connect with the Toledo & Chicago Interurban Railway running to Fort Wayne and Kendallville. E. E. Darrow, general manager, Toledo, O.

United Railways & Electric Company.—This company is making surveys for a new line on the York road from Towson to Cockeysville, Md., via Lutherville.

Union Traction Company of Kansas.—D. H. Siggins, president, Independence, Kan., announces that work is to begin in April on the line from Independence to Cherryvale and Parsons, and that the line from Coffeyville to Independence, which is now nearing completion, should be in operation by May 1. A city line is also to be built in Coffeyville. The power house at Independence is nearing completion.

United Traction Company.—General Manager E. S. Fassett, of Albany, N. Y., has announced that this company will build a line from Troy to Rennselaer, N. Y., connecting with the present systems in those two cities, and establish a belt line between Troy and Albany.

West Penn Railways Company.—This company will build an extension from Footedale to Brownsville, Pa., 9½ miles. John Duggan, of New Haven, has the contract for the first 3 miles from Footedale to Orient. The line from Leckrone to Masontown will be completed by February 1, it is stated. F. H. Glenson, of McKeesport, Pa., receiver for the Bessemer Contracting & Ballast Company, which had the contract, is finishing the work.

Winona Interurban Railway.—It is reported that this company will begin the immediate construction of its proposed line from Warsaw to Valparaiso, Ind. S. C. Dickey, general manager, Winona Lake, Ind.

Woodbury & Waterbury Street Railway.—This company has awarded the contract to construct a trolley line from the Waterbury town boundary through Middlebury to Woodbury, Conn. The contractors will do as much rough work as possible during the winter, and in the spring a large force will be employed to push the enterprise to completion. At the Waterbury end the line will connect with the Connecticut Railway & Lighting Company.

York County Traction Company.—This company has completed surveys for its line from York to Hanover, Pa., 20 miles, and has filed a plan with the secretary of state showing the route. David Young, Jr., general manager, York, Pa.

POWER HOUSES AND SUBSTATIONS.

Denver City Tramway.—This company has contracted with the Allis-Chalmers Company for a 4,000-hp. steam turbine, to be installed in the Platte street power house, at a cost of about \$75,000. According to the contract the turbine is to be installed and in operation by July 1. The new turbine will add 35 per cent to the present power capacity of the company, and is required for the numerous extensions that are to be undertaken at once under the provisions of the franchise voted last May. John A. Beeler, vice-president and general manager, Denver, Colo.

Jackson (Tenn.) Railway & Light Company.—This company expects to occupy its new power plant, located just outside the city of Jackson about March 15. The generating units are to be two 300-kw. Parsons turbines. The building, which is of concrete and brick construction, will be enclosed by February 1. Mr. S. S. Bush, of Louisville, Ky., is vice-president and general manager.

Omaha & Council Bluffs Street Railway.—This company will begin work this spring on the construction of three substations, one at the shops at Twenty-sixth and Lake streets in Omaha, and one near the south end of South Omaha, to supply the Bellevue line. A portable substation will also be built. G. W. Wattles, vice-president and general manager, Omaha, Neb.

Utah Light & Railway Company.—The board of directors has authorized an appropriation for the construction of a new power plant on the site of the present one near the Jordan river and it is announced that work will be commenced in a few days and aimed to completion. Plans and specifications have been prepared. The new plant will have a capacity of 25,000 hp. and will replace the four power houses now required for the entire system, in Salt Lake City and vicinity, which are located near Provo, at Garland near the mouth of the Big Cottonwood canyon, and near the Jordan river. The new plant will provide for both the railway and lighting loads and will be so arranged as to enable the capacity to be increased when occasion shall require it. O. A. Honnold, chief engineer Salt Lake City, Utah.

Youngstown-Sharon Railway & Light Company. A new 400-kw. rotary converter has been installed in the substation of the Valley Street Railway at Sharon, Pa. A 3,000-kw. generator has been installed in the main power house at Youngtown, O.

Personal Mention

Mr. D. L. Prendergast has been appointed acting secretary of the Boston Elevated Railway, in place of Mr. John T. Burnett, resigned.

Mr. Frank L. Casey has been appointed assistant superintendent of the traffic department of the Elmira Water Light & Railroad Company, of Elmira, N. Y., to succeed Mr. Edwin S. Becker, resigned.

Mr. E. S. Pattee, secretary and auditor of the Twin City Rapid Transit Company, of Minneapolis, Minn., has been appointed secretary and comptroller of the company. Mr. D. J. Shouse, heretofore assistant auditor, has been appointed auditor.

Mr. M. E. Kaper has been appointed division passenger and freight agent of the Indianapolis & Eastern Railway and the Indianapolis & Martinsville Rapid Transit Company, with headquarters at Greenfield, Ind., succeeding Mr. J. F. Fletcher, resigned.

Mr. Parley L. Williams has been appointed general counsel of the Utah Light & Railway Company, of Salt Lake City, Utah, succeeding Judge Le Grand Young, resigned. Mr. E. M. Bagley has been appointed claims attorney.

Mr. W. H. Owens, heretofore superintendent of the Madison County Light & Power Company, has been appointed assistant general superintendent of the Decatur Railway & Light Company, a part of the Illinois Traction System, with headquarters at Decatur, Ill.

Mr. W. G. Jayne, for the past three and a half years superintendent of the Columbus Urbana & Western Traction Company, has resigned to take a similar position with the Schoepf syndicate at Dayton, O., effective on January 15. Mr. Jayne's successor has not yet been appointed.

Mr. C. S. Bidwell, for the past three years purchasing agent for the Indiana Columbus & Eastern Traction Company, with headquarters at Columbus, O., has been appointed chief clerk to Mr. J. L. Adams, general manager of the western division of the system, with headquarters at Dayton, effective on February 1. In future all purchases will be made from the Cincinnati office and the purchasing department at Columbus will be abolished.

Mr. Charles A. Floyd, since 1902 general passenger and freight agent of the Grand Rapids Holland & Chicago Railway, with office at Grand Rapids, Mich., has been appointed manager of the Michigan State Fair Association, and will devote a third of his time to his new position, with headquarters at Detroit, retaining his position with the railway. Mr. Floyd has been connected with the Grand Rapids Holland & Chicago for eight years, having entered its service as a bookkeeper.

Financial News

Bennington & North Adams Street Railway.—This company, which is owned by the Consolidated Railway, of New Haven, Conn., and which is constructing an electric railway from North Adams, Mass., to Bennington, Vt., has acquired by exchange of stock the Bennington & Hoosick Valley Railway, which connects Bennington and Hoosick Falls, N. Y., and has franchise for several extensions, including one to Troy. The Bennington & North Adams company is capitalized at \$650,000. The officers of the company are: President, Charles S. Mellon, of New Haven; vice-president, Calvert Townley, New Haven; treasurer, O. M. Barber, of Bennington.

Broad Street Rapid Transit Railway.—The court of common pleas in Philadelphia has decided that the Broad Street Rapid Transit Railway Company, which was chartered under the act of 1901 for the purpose of operating a surface railway on Broad street, cannot legally exercise the alleged right conferred by the act of the legislature, and the court directed that a judgment of ouster be entered against the defendant company. The court holds that the act of 1866 for the improvement of Broad street, which directed the removal of all railway tracks and forbade the city from any time in the future granting any privilege to railway or railroad companies to occupy that street, is still in full force and effect, and was never repealed by implication or otherwise.

Central California Traction Company.—An agreement has been reached between the promoters of the Central California Traction company and the projectors of the new electric line to connect Sacramento and Lake Tahoe, whereby the latter company will have the use of the former's tracks from Brighton to Sacramento, including the terminal of the traction company in that city, which will be reached by a private right of way between J and M streets. The Tahoe road will follow the banks of the American river from Folsom to Brighton, where it will connect with the traction company's line running from Stockton through Lodi, Elk Grove and Florin. E. P. Hillburn, of Stockton, Cal., is general manager of the Central California company.

Cincinnati Newport & Covington Light & Traction Company.—The directors have declared a quarterly dividend of 1½ per cent on the preferred stock, payable on January 15.

Denver City Tramway Company.—The case of the people of Denver against the company, brought by the district attorney,

to test the legality of the franchises voted to the company last May, has been decided in favor of the company.

Denver Southeastern Railway.—This company, which proposes to build an electric railway connecting Denver, Englewood, Littleton and Ft. Logan, Colo., has elected the following officers: President, George I. Cole; vice-president, C. H. Chase; secretary, I. C. Cockey; treasurer, S. B. Thomas; all of Denver, Colo.

Des Moines Winterset & Creston Electric Railway.—At the recent annual meeting the officers were re-elected as follows: W. D. Skinner, president, Des Moines; J. H. Mack, vice-president, Macksburg; W. B. Steere, vice-president, Des Moines; S. D. Alexander, treasurer, Winterset; Milo Ward, secretary, Des Moines; A. E. Park, general manager, Des Moines. The company has secured about half of the right of way for its proposed line from Des Moines to Winterset, via Creston and Macksburg, Ia., 60 miles, and surveys have been made. B. Schreiner, of Des Moines, is chief engineer.

East Reading Passenger Railway.—At the recent annual election of this company, which is controlled by the United Traction Company, of Reading, Pa., the following directors were chosen for the ensuing year: A. J. Brumbach, Jonathan G. Leinbach, William R. McIlvain, George W. Bard, J. A. Strohecker, Frank P. Esterly and Wm. McIlvain. The board elected the following officers: President, A. J. Brumbach; vice-president, J. G. Leinbach; secretary, William McIlvain; treasurer, A. Raymond Bard.

Frederick & Middletown Railroad.—At the annual meeting on January 8, the following officers were elected: President, James E. Ingram, Jr., of Baltimore, Md.; vice-president, Emory L. Coblenz, of Middletown, Md.; secretary, Edgar W. Hartlove, of Baltimore; treasurer, Thomas H. Haller, of Frederick.

Gallon Mt. Gilead & Delaware Electric Railway.—This company which proposes to build an electric line connecting the towns named, has organized by electing the following officers: President, S. P. Gage, Mt. Gilead, O.; first vice-president, John A. Shumaker, Delaware, O.; second vice-president, W. P. Vaughn, Cardington, O.; secretary, O. A. White, Mt. Gilead.

Hagerstown (Md.) Electric Railway.—It is stated that a meeting of the stockholders will be called at an early date to authorize an increase in the capital stock from \$200,000 to \$1,000,000 for the purpose of securing funds for proposed extensions.

Hartford & Springfield Street Railway.—This company has applied to the secretary of state of Massachusetts for an amended charter authorizing it to exercise all the rights and franchises of the East Windsor Street Railway, the Somers & Enfield Electric Railway, the Windsor Locks Traction Company and the Rockville Broad Brook & East Windsor Street Railway, to build a railway in Somers and Stafford, Conn., and to increase its capital stock. W. A. Tucker, Boston, Mass., is president.

Houston-Galveston Traction Company.—A bill has been introduced in the Texas legislature which carries a clause to enable the Stone & Webster Engineering Corporation, of Boston, Mass., to build its proposed line from Galveston to Houston, Tex. It is considered that such an enabling act is necessary because it is proposed to cross from Galveston to the mainland over a causeway to be constructed. Surveys have been made for the road and the project has been financed on condition the enabling act is passed.

Interborough-Metropolitan Company.—The stockholders held the annual meeting at New York on January 15 and re-elected the following seven directors, whose terms of office had expired: August Belmont, Andrew Freedman, Cornelius Vanderbilt, Paul D. Cravath, Edward J. Berwind, P. A. B. Widener and Walter G. Oakman. The board is composed of twenty-one members, divided into three classes seven of whom are elected each year.

Kansas City & Bonner Springs Railway.—It is reported that Samuel Brown, of Philadelphia, has purchased the rights and property of this company, which has the right of way and has done some construction work between Kansas City, Mo., and Bonner Springs, Kan., for \$200,000. John W. McDaniel, president, Bonner Springs, Kan.

Kansas-Oklahoma Interurban Railway.—This company, which proposes to build an electric railway connecting Winfield, Arkansas City, Geuda Springs, Ark., and the Chilocco Indian School, has organized by electing the following directors: W. C. Robinson, W. H. Somermier, of Winfield; C. A. Scruton, S. P. Gould, L. H. P. Northrup, A. J. Hunt and C. L. Brown, of Arkansas City. The directors elected the following officers: W. C. Robinson, president; L. H. P. Northrup, vice-president and general manager; C. A. Scruton, secretary and treasurer; S. P. Gould, auditor.

Lake Shore Electric Railway.—At the annual meeting in Cleveland on January 15 the directors were all re-elected. The directors then re-elected the following officers: President, Edward W. Moore; vice-presidents, W. H. Price and J. Cooke; secretary and treasurer, F. W. Coen, all of Cleveland. In President Moore's annual report it was shown that the double-tracking of the line between Cleveland and Lorain has been completed. There was also built during the year an extension to the Beech Park power-house, while a substation was installed with good results at Dover Bay. In addition the company has done a good deal of work along the line and in rebuilding the tracks in Sandusky. In the matter of new equipment the company purchased and put in operation ten new cars, which are showing good results in the way of increased earnings. During the year, also, the construction of the line between Sandusky and Fremont was started, and so much progress has been made that the line will be completed and in operation by the first or middle of May. As far as improvements for the current year are concerned the company has

under contemplation an increase in power house facilities at Fremont. The company also has under order 12 new cars that will be delivered early this spring. The financial statement for the year compares as follows:

	1906.	1905.
Gross receipts	\$866,970.16	\$788,268.47
Operating and taxes	476,257.85	428,588.23
Net earnings	390,712.31	359,680.24
Interest charges	254,198.37	244,850.90
Net surplus	136,513.97	114,830.24

Milwaukee Electric Railway & Light Company.—The annual meeting will be held in Milwaukee on January 21. Arrangements will be made to provide additional capital for the extension of the lines within the city; for the construction of new power generating stations or adding to the capacity of the present ones; for the construction of car houses and machine shops, and for other purposes necessary to meet the increasing demands which are being made upon the company. It is proposed not only to provide for the immediate wants of the company but to make provision for future requirements. It is also proposed to refund the extension mortgage bonds by a new issue of common stock. The meeting of the subsidiary company, the Milwaukee Light, Heat & Traction Company, will be held at the same time and it is proposed to issue additional stock to provide for several extensions. John I. Beggs, of Milwaukee, is president of both companies.

Newport & Alexandria Traction Company.—At the annual meeting of this company held in Alexandria on January 7, the following officers were elected: A. S. Berry, president; Andrew Turner, vice-president; Joseph Wright, treasurer; W. H. Wagoner, secretary. The directors are, Henry Fahrenholtz, Frank Thatcher, John Todd and M. Kintler. The route for this proposed line has been surveyed and it is stated will be built in the near future.

Newton & Northwestern Railroad.—The minority stockholders of this company has applied for an injunction restraining the majority from leasing 44 miles of the road to the Ft. Dodge Des Moines & Southern Electric Railway, claiming that the leased part of the road would destroy the value of the remainder. The Ft. Dodge Des Moines & Southern, which is composed of many of the same stockholders as the Newton & Northwestern, is preparing to electrify the latter road and use it as part of an electric railway system from Ft. Dodge to Des Moines.

Northern Ohio Traction & Light Company.—The city of Akron, O., has brought suit against this company to recover \$27,732, half of the city's share of the cost of the Mill street viaduct. The city paid for half of the viaduct and the other half was paid by steam railroads. The city now seeks to compel the traction company, which uses the viaduct, to pay half of its share, as provided by an ordinance of April 4, 1904.

Omaha & Council Bluffs Street Railway.—The annual meeting of the stockholders and directors was held on January 14 and the officers and directors were all re-elected. The officers are: President, Guy C. Barton; vice-president, G. W. Wattles; second vice-president, M. S. Hopkins; treasurer, W. A. Smith; secretary, R. A. Leussler.

Paris Traction Company.—This company, which is building a line 3½ miles long in Paris, Ill., has certified to an increase of capital stock from \$5,000 to \$50,000.

United Traction Company.—The board of railroad commissioners of New York state has granted the application of the United Traction Company, of Albany, N. Y., for permission to increase its capital stock from \$5,000,000 to \$13,500,000. The new issue will be used to take up the outstanding securities of the Hudson Valley Railway, which are owned by the United Traction Company. Steps toward the consolidation of the two companies were taken at a meeting of the United company several weeks ago, and the merger was made effective about two weeks ago when General Manager E. S. Fassett, of the United Traction Company, had his jurisdiction extended over the Hudson Valley company. The Hudson Valley company was formed in 1901, and operates in the territory from Troy to Saratoga and north to Caldwell and Warrensburg, on Lake George. The capital stock is \$3,000,000, and the original bond issue amounted to \$4,000,000. There has since been a debenture issue to meet the requirements of the company.

Urbana Bellefontaine & Northern Railway.—The court has confirmed the report of the receivers, J. G. Schmidlapp and Myron H. Wilson, and the receivership has been closed. The road is one of the old Appleyard lines, and was purchased last spring by the Schoepf syndicate.

Utah Light & Railway Company.—The executive committee has decided to call in on August 1 an issue of \$500,000 6 per cent second mortgage bonds, issued in February, 1901.

Western New York & Pennsylvania Traction Company.—The New York railroad commission has granted this company permission to issue a first refunding mortgage for \$5,000,000, only half that amount of bonds, however, to be issued under this consent.

Worcester Consolidated Street Railway.—At the recent meeting of the directors President Francis H. Dewey and the other officers were re-elected.

York (Pa.) Street Railway.—This company has purchased the property, charters and franchises of the Colonial Street Railway, the Penn Park Street Railway, the York Intramural Street Railway, the York Railway & Electric Company, the York & Hanover Western Railway and the York & Susquehanna Railway, all of York, Pa. The company has applied to the city council for the right to build these lines, with several changes in routes and other changes made necessary by the new arrangement, agreeing to pay the city 3 per cent of the gross earnings. These extensions include various loop lines in the city and lines to the suburbs.

Manufactures and Supplies

ROLLING STOCK.

Citizens Railway, Lincoln, Neb., is reported about to order 6 additional cars.

Gray's Harbor Electric Company, Aberdeen, Wash., has ordered one car of the J. G. Brill Company.

United Railways & Electric Company, Baltimore, Md., has ordered 40 cars from the John Stephenson Company.

Newport News & Old Point Railway & Electric Company, Newport, R. I., is asking prices on new equipment for eight cars.

Vallejo Benicia & Napa Valley Railway, Napa, Cal., is reported to have ordered 8 new cars from the Niles Car & Manufacturing Company.

Norfolk & Portsmouth Traction Company, Norfolk, Va., has an order on file with the J. G. Brill Company for 41 motor and 28 trailer cars.

Spokane Traction Company, Spokane, Wash., is reported to have placed an order for ten new cars of the Detroit type for delivery in March.

Lima & Toledo Traction Company, Lima, O., has ordered five passenger cars from the Cincinnati Car Company for delivery early in the summer.

Terre Haute Traction & Light Company, Terre Haute, Ind., has ordered 16 new trucks from the Baldwin Locomotive Works for use under new cars.

Oakland Traction Consolidated, Oakland, Cal., is reported to be building 20 new 50-foot cars and will soon commence work on 20 new 55-foot steel frame cars.

Savannah Electric Company, Savannah, Ga., will order 12 new cars. Prices are being asked on equipment for 10 motor and 4 trailer cars and the company expects to order 50 new equipments in the near future.

Memphis Street Railway Company, Memphis, Tenn., will place an order during this month for 25 double-truck full-vestibule cars to be 30 feet in length. No details of the specifications for the cars have yet been announced.

Jackson Railway & Light Company, Jackson, Tenn., is soon to receive from the American Car Company six 20-foot semi-convertible single truck cars to be mounted on Brill 21-E trucks and to be equipped with Westinghouse 92-A motors, two to each car; Consolidated Car Company's heaters and Ohmer registers. The company is also rebuilding in its own shops 6 old cars.

Nashville Railway & Light Company, Nashville, Tenn., will order 30 double-truck cars in the spring, specifications for which are now in the hands of the engineers of the company. This company is also converting eight 42-foot trailers into motor cars at the new shops of the company. Three of the cars have already been converted and work on the other three will be commenced at an early date.

SHOPS AND BUILDINGS.

Illinois Traction Company.—The present power house of the Peoria Railway, between Chestnut and Walnut streets, Peoria, is to be remodeled and used as a passenger station and freight house for the Peoria Bloomington & Champaign Railway division, and power will be taken from the new power house now being completed at Peoria.

Interborough-Metropolitan Company.—This company has applied to the city authorities to close Ninth avenue above Two Hundred and Eighteenth street, New York, and also several cross streets, for a site for its proposed \$2,000,000 repair shops. The company has already acquired the private property.

Rhode Island Company. It is stated that this company is considering plans for a new car house, 160 by 150 feet at Westcott. R. I. A. E. Potter general manager, Providence, R. I.

Utah Light & Railway Company. This company has purchased a 16-acre block of land, located between Fifth and Sixth South streets and Sixth and Seventh East streets, in Salt Lake City, Utah, on which to erect a large car barn and shops to accommodate the cars of the entire system. It is stated that the buildings will cost approximately \$1,500,000. The land chosen is centrally located and is an ideal site for the car barn. O. A. Honnold, chief engineer, Salt Lake City.

TRADE NOTES.

Silker Car Works, Limited, Halifax, N. S., has been incorporated with \$125,000 capital stock and will manufacture street cars.

Central Steel Castings Company, of Columbus, O., has been incorporated with a capital of \$100,000. The incorporators are John B. Bonney, Walter E. Floyd, Perin B. Monypenny, John Rogers and Karl E. Burr.

Buchanan-Foster Company, Philadelphia, manufacturers of roofing materials and cold air product, have removed their office from the Broad Building to the West End Trust Building, Broad

and South Penn Square. The company make a special brand of ready roofing known as the "Congo" which is readily applied to all classes of buildings.

Central Inspection Bureau, 17 State street, New York, has received an order from the American Railways Company, Philadelphia, for the inspection of ten double-truck cars to be built by the Jewett Car Company.

Buffalo Forge Company, Buffalo, N. Y., reports a long list of recent orders for its products, including mechanical draft apparatus, heating equipment, centrifugal pumps, air pumps, jet condensers and pressure pumps.

Dossert & Company, 242-244 West Forty-first street, New York, manufacturers of Dossert solderless connectors and terminals for wires and cables, has an exhibit at the electrical trades exposition in Chicago. Its booth is located in section F, space 8.

Allis-Chalmers Company, Milwaukee, has received an order from the Seamless Tube Company of America for four 300-horsepower Allis-Chalmers compound wound, non-reversible direct-current motors for use in the manufacturing plant of this company situated at Monessen, Pa.

Elroy N. Heath, the New England manager for H. B. Smith Machine Company, has established in the Oliver building, Boston, Mass., a machinery exchange, occupying about one-third of a street floor. The idea of this exchange is to bring together concerns in mechanical lines in one home.

Fitzgerald Air Brake Company, of Chicago, has removed its offices from the Railway Exchange building to 1321 First National Bank building. The new quarters secured by the company will give it considerable more space and a very desirable location from which to carry on its business.

Electric Fountain Company of America, Philadelphia, Pa., recently made a shipment of its portable fountains to Valparaiso, Chile. This company makes electric fountains suitable for electric railway parks, many of which, including Willow Grove Park of the Philadelphia Rapid Transit Company, have been supplied during the past few years. The electric fountain at Willow Grove Park is apparently as popular an attraction today as it was when first installed several years ago.

Midvale Steel Company, of Philadelphia, has ordered from Allis-Chalmers Company a heavy-duty cross-compound engine, with cylinders 30 and 46 by 48 inches, for direct-connection to an electric generator, to be installed in its plant at Nicetown, Pa. As this unit will be subjected to extreme overloads during its ordinary operation, the engine is required to be very strongly built. The engine is to be operated non-condensing and the normal capacity of the unit will be 1,000 kw.

Henry R. Towne, president of the Yale & Towne Manufacturing Company, of Stamford, Conn., at a meeting of its superintendents and foremen held recently, made an announcement of an increase of wages and piece rates of its 3,000 employees. The company proposes by this change to distribute annually \$120,000 additional to its employees, believing that its liberal policy in these respects is appreciated and will result in increased efficiency and therefore in better economy. This action is entirely voluntary on the part of the company.

Beaudry & Co., manufacturers of Champion power hammers and Duplex forging presses, has been incorporated under the state laws of Massachusetts. The growth of the business in the past few years has necessitated this and permits Otto Abrahamson, who has been in charge of the sales department, to become a member of the company. Mr. Abrahamson will have the title of vice-president and general manager, still continuing in charge of sales. The office of the company is in the Oliver building, Milk and Oliver streets, Boston. Mr. A. Beaudry is president and treasurer.

Electric Storage Battery Company, of Philadelphia, manufacturer of the chloride accumulator, has installed four of the eight substation batteries contracted for by the New York Central & Hudson River Railroad Company for use in connection with the electrification of the New York terminal. The batteries now in operation are located respectively at Bronx Park, Kings Bridge, Mott Haven and Fifteenth street. The eight batteries will have a total capacity of 60,000 hp. One of the two exciter batteries contracted for by the same company has also been installed at Port Morris.

Randall Tram-Rail Company, Philadelphia, Pa., has moved its offices from Waterloo street to the corner of Allegheny and Frankfort avenues where they will occupy the whole of a one-story building. The company has added new machinery, making the plant modern and up-to-date, and the entire line of the company will be devoted to the manufacture of the Moyer tram-rail system. This business was formerly conducted under the name of R. T. Randall & Co., but has now been made a distinct concern. Mr. Albert W. Moyer, well known in this line, has been appointed general manager of the company.

Chicago Pneumatic Tool Company, in connection with the announcement that it has in course of preparation a catalogue describing and illustrating its line of Chicago Giant rock drills, calls attention to rock drills as a factor in the prosperity of the country. It is less than 50 years since the state of Massachusetts undertook to excavate the Housatonic tunnel, when the Burleigh rock drill was introduced, it being the first rock drilling machine. Since that time it is admitted that the rock drilling machine has been an important factor in the industrial world, it being one of the means of securing the best and quickest production of coal

and other minerals which have to be mined, and of quarrying rock needed for a multitude of purposes appertaining to manufacture and transportation.

Quincy Manchester Sargent Company, Chicago and New York. has appointed Howard M. Post advertising manager of the company. Mr. Post originally fitted himself for a telephone engineer and for three years held a position as switchboard installer for the Western Electric Company. Later he accepted a position as telephone engineer of the Kellogg Switchboard & Supply Company, and during a period of five years took out several telephone patents. His thorough knowledge of the telephone business led the company to offer him the position of advertising manager, which he accepted and handled very successfully.

Pittsburgh Steel Company, as announced from Monessen, Pa., will build a \$7,000,000 addition to its plant at that point to include two blast furnaces, a blooming mill and open hearth furnaces. In the past few months the steel company has purchased a tract of land from the Monessen Foundry & Machine Company and considerable land on which the village of Wireton stands from the Standard Land Improvement Company, giving it a total river frontage of from one to one and a half miles. The new furnaces will be erected between the Pittsburg & Lake Erie Railroad and the Monongahela river, taking up a large amount of river frontage.

ADVERTISING LITERATURE.

General Fireproofing Company, Youngstown, O.—This company is mailing samples of "Trussit" metal for reinforcing purposes.

Buffalo Forge Company, Buffalo, N. Y.—Catalogue No. 77 introduces, in addition to the regular line of tools which has been upon the market under the name of the Buffalo Forge Company for several years, a number of entirely new machines, as well as changes and improvements in older designs. Among the new

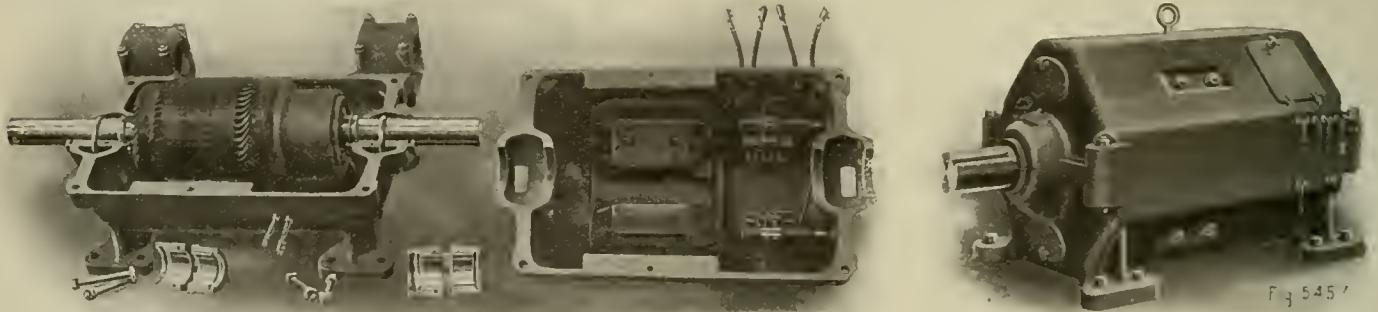

which is manufactured for a great variety of industrial purposes. The company states that these motors are being installed to operate machinery for which motor drive has heretofore been considered either undesirable or impracticable and believes, therefore, that this bulletin will be of particular interest to the owners of plants of various kinds throughout the country.

MOTORS FOR ROLLING MILLS.

The direct-current electric motor herewith illustrated is being introduced by the Crocker-Wheeler Company, Ampere, N. J., to meet the demands of rolling-mill service which requires a completely enclosed motor for intermittent but heavy work. It is known as the "W" motor and is built for 25, 50, 75 and 100 horsepower.

The parts are very heavy, corresponding approximately to the parts of ordinary motors of about twice the rated capacity. Inclosing has been carried to the extent that the ends of the bearings are sealed so that dust cannot enter. The motors will operate in either direction under ordinary overloads without sparking. The field frame is of steel and is divided horizontally so that the upper half can be readily removed. The shafts are of forged steel and much larger than for other types of motors for a similar output, and as the commutator is keyed to a sleeve extension of the flange forming one end of the armature core it can be readily removed without disconnecting the windings. The air gap is made large to minimize the trouble due to wear of bearings and displacement of the armature. The bearings are of heavy cast iron cylinders split horizontally and lined with babbit. They are of the ring-oiling type and have diagonal grooves for distributing the oil over the area of the bearings. Asbestos is used liberally in the windings in the place of vegetable substances on account of the heat of the atmosphere in which they are expected to work.

We are informed that these motors are in use by the follow-

Motor for Rolling Mills.

machines are two ball-bearing forges, a hand blower with high-speed gear running underneath the surface of an oil bath and a direct-drive blower.

American Carbon & Battery Company, East St. Louis, Ill.—This company has issued a new list of prices of stationary motor and generator carbon brushes, effective January 1, 1907. The catalogue lists and shows illustrations of a new form of motor brush which it has made to meet the special requirements of street railway use and a new form of pig tail, with which connection it is stated, it is possible to save from 10 to 20 per cent on pig tails used on small machines.

Atlas Engine Works, Indianapolis, Ind.—General bulletin No. 134 briefly lists, with illustrations and specifications, the complete line of this company, which, it is believed, is the largest exclusive builder of steam engines and boilers in the world. The company manufactures a very complete line of engines and boilers of various types and maintains branch offices and warehouses in all parts of the United States in order to be able to promptly fill rush orders for equipment of the sort manufactured by it.

Cincinnati Rubber Manufacturing Company, Cincinnati, O.—The Cincinnati Rubber Manufacturing Company was incorporated under the laws of the state of Ohio to purchase the extensive rubber business formerly owned by the Whitman & Barnes Manufacturing Company, of Akron, O., and retains the same management, superintendent, foremen and other employes, with such additions as have been made necessary by increased business. The lines of manufacture of the company include belting of all kinds and for all purposes, hose for all classes of service, packings and other rubber specialties which are described in a substantial 100-page catalogue containing various useful formulae.

Allis-Chalmers Company, Milwaukee, Wis.—This company is about to distribute a revised edition of Bulletin No. 1045, which is descriptive of Allis-Chalmers rotary converters. The publication includes 16 pages with numerous illustrations and describes the characteristic features of converters of various capacities. Bulletin No. 1040 describes the line of polyphase induction motors,

ing companies: Bethlehem Steel, Carnegie Steel, Illinois Steel, Lorain Steel, National Tube, Pennsylvania Steel, Shelby Steel Tube and Youngstown Sheet & Tube.

Exhibit of the H. W. Johns-Manville Company at Chicago's Second Annual Electrical Show.

At the second annual electrical show in progress at the Chicago Coliseum, the H. W. Johns-Manville Company, whose headquarters are in New York, has an extensive exhibit. Among its numerous electrical specialties a line of Victor direct-reading instruments is shown. These include Victor direct-current volt and ammeters, Victor combination meters of both the switchboard and portable types, as well as a special Victor combination meter for automobile use.

The manufacturer states that the Victor combination meter is the only direct-reading electrical instrument of its kind on the market giving a simultaneous reading of volts, amperes, watts and horsepower on one dial. It consists of a volt-meter and ammeter and is therefore practically two separate and complete instruments, which are combined in one case and so arranged that the indicators cross each other, each acting independently of the other as far as volt and ampere readings are concerned. The readings in watts and horsepower are obtained from the point of intersection of the two indicators. The Victor has a wide range of uses. As it is probably the only practical switchboard instrument giving a reading in watts and horsepower it adapts itself to use on the smallest switchboard panels.

Among the other materials exhibited is J-M friction tape, the friction material being well worked into the fabric and running true to gauge throughout the entire roll. The tape is made for extremely long service under all conditions.

Noark subway and service boxes are shown of one, two and three-pole construction and 250, 600 and 2,500-volt capacity. These boxes are water-tight, being designed and tested to withstand a pressure of 25 pounds per square inch without leaking, and accordingly suitable for most severe conditions. Other lines shown are the Noark national standard fuses, blocks and accessories and J-M overhead line material.

The people of Easton, Pa., know a good deal more about municipal ownership than they did when they joyfully celebrated the inauguration of municipal electric lighting a few years ago. The knowledge gained by experience has cost something between \$4,000 and \$5,000 per year paid out of taxes for deficits in operation—

An Example of Municipal Ownership.

but the lesson has been thoroughly learned. Incidentally the outages have grown so frequent that the "lighting" has been recently little if any superior to total and unmitigated darkness, so that women and children have been warned not to go about after dark. Now the leading business men have petitioned the city council to dispose of the plant to a private corporation and pending arrangements for that purpose to let it be operated by contract with some private individual or corporation. Thus does another municipal enterprise pass to its inevitable and inglorious end.

At the recent meeting of the executive committee of the American Street and Interurban Railway Engineering Association the question of rail corrugation was brought up and disposed of by reference to the secretary of the American Street and Interurban Railway Association, who volunteered to collect data relating to the subject. In the latest issue of the Electrical Age, Mr. H. H. Nichols, engineer of maintenance of way, Philadelphia Rapid Transit Company, relates the result of certain investigations as to the causes of rail corrugation. Four different causes are suggested—the vibration or lateral bending of the web of the rail itself; the rails being loose upon their supports; the ties being loose on their foundations; the vibration or movement of the foundation immediately under the track structure. These four causes seem capable of being resolved into one primary cause—the greater or less freedom of the rail to vibrate in a lateral direction, which freedom would exist in a decreasing ratio through the four conditions named. That the reason stated for the formation of corrugations is a plausible one appears from Mr. Nichols' experiments in which the vibrations were caused to cease and the corrugations gradually to disappear by the application of a 30-foot fishplate

Corrugated Rail and Plenty of Tie Rods.

bolted to the outside of the rail. As stated in the account referred to, this method of correction would be expensive and therefore impracticable. The facts, however, suggest a remedy that should be at least partially effective. It appears from the papers presented at the recent meeting of the Street Railway Association of the State of New York, and frequently in the discussion thereupon, that a liberal use of tie-rods and steel ties is requisite to a smooth-riding and easily maintained track. Though the matter of corrugation was not brought up, there is little question but, if Mr. Nichols' theory is correct, the same cause that contributes to corrugation would also contribute to a general unsatisfactory condition involving unnecessary expense of maintenance. It is therefore suggested that corrugations as well as many of the other ills to which track is subject may be cured or relieved by the liberal use of tie-rods, for the reason, if for no other, that the forces supposed to contribute to vibration act upon opposite rails in opposite directions at any given time.

In its ideal form, whatever that may be, the steel tie should assist to serve the same purpose. The proper use of a proper form of steel tie should cover the second and third causes of corrugation as named by Mr. Nichols, viz.:—the looseness of the rails upon their supports and the looseness of the ties upon their foundations. The fourth cause, the vibration or movement of the foundation immediately under the track structure seems in these days of 10 to 12-inch solid concrete foundations too remote to warrant extended consideration. But the looseness of rails upon their supports when the latter are wooden ties and the method of fastening is the ordinary spike, is a rather universally existing condition. To obviate it requires constant attention and care on the part of the maintenance of way department. On the other hand, if there is any one feature of the steel tie which should commend it primarily, it is that the fastening between the rail and the tie can be made absolutely secure and kept so with a fraction of the labor required with the wooden tie and the spike fastening. Second only to the security of the connection between the tie and the rail, is, according to Mr. Nichols, the security with which the tie is held in its

Steel Ties and Rail Corrugations.

bolts to the outside of the rail. As stated in the account referred to, this method of correction would be expensive and therefore impracticable. The facts, however, suggest a remedy that should be at least partially effective. It appears from the papers presented at the recent meeting of the Street Railway Association of the State of New York, and frequently in the discussion thereupon, that a liberal use of tie-rods and steel ties is requisite to a smooth-riding and easily maintained track. Though the matter of corrugation was not brought up, there is little question but, if Mr. Nichols' theory is correct, the same cause that contributes to corrugation would also contribute to a general unsatisfactory condition involving unnecessary expense of maintenance. It is therefore suggested that corrugations as well as many of the other ills to which track is subject may be cured or relieved by the liberal use of tie-rods, for the reason, if for no other, that the forces supposed to contribute to vibration act upon opposite rails in opposite directions at any given time.

foundation. Whether the latter is gravel, broken stone or concrete, it appears beyond discussion that a steel tie is better adapted to be made of a section that can be held in place so long as the foundation maintains its integrity, than is the wooden tie of ordinary section. In fact, there is a serious question as to the propriety of embedding a wooden tie at all, especially in concrete, on account of the possibility of a dry rot which would afford an additional element of risk against the holding power of the spike. It goes without saying that all methods of avoiding corrugations in the rails will fail if the web of the rail is inadequate to the support of its load. Buckling of the web of the high girder rail was referred to at the meeting of the New York association as one of the reasons for expressing a preference for the T-rail. Corrugations due to this cause are, according to Mr. Nichols, difficult to remedy without considerable expense, but may be avoided in the beginning by the use of a thicker web. The data which Secretary Swenson has undertaken to collect should be of much interest in the way of throwing light on a matter about which little is actually known and in which every operating and maintenance officer is concerned. It may well be that in removing the causes of rail corrugation the entire track structure will undergo an improvement.

LIMITED INTERURBAN SERVICE.

By the institution of limited service an interurban line attains a standing which no merely local system can ever enjoy. Provision for fast through travel is one of the most prominent tendencies of the times in electric railway practice, and in some parts of this country, notably in the central states, the development of limited car or train service has reached a remarkable stage of efficiency. The running of such cars as those between Dayton and Toledo, where through cars cover 160 miles in six hours, making but 14 regular stops en route, or from Cleveland to Toledo, where 120 miles are covered in four and one-half hours, with 12 regular stops, involves a very high degree of operating responsibility, since the maximum speeds must fall close to a mile a minute on clear stretches of track.

It is a little singular that this class of service has thus far not been generally attempted on many of the interurban lines in other parts of the country, considering the success which it has attained in Ohio, Indiana and other states in their vicinity. Doubtless, the fact that even the limited service of the central west has not been thoroughly standardized in detail has been influential in retarding the development of express passenger service in other sections; but no one can analyze the tendencies of interurban practice at the beginning of this new year without feeling that the time is not far distant when limited cars will be demanded by the long-distance traveling public, regardless of the section in which the roads in line for such service are operated.

Comparatively few interurban roads are as yet double-tracked throughout their entire length, and the excellent records thus far made with limited cars have almost exclusively been accomplished under the difficulties of single-track operation. On many lines having limited cars in regular service the fast movements are alternated with the locals, giving an hourly headway in each direction. In other cases the limiteds are sandwiched in between the regular hourly locals. With half-hourly headway on single tracks cars pass one another every 15 minutes, so that extraordinary care is necessary for safe operation, and only the most rigid rules followed with intelligent appreciation of their applicability to all emergencies, insure the safe movement of limited cars among the large number of locals always present on the system. Just when it is best to double-track an interurban line is a matter about which there is no little difference of opinion at this time. If limited cars are to be operated at very high speeds on roads sending cars over the line on

30-minute intervals in each direction, the advisability of double-tracking is to be seriously considered, just as it is high time to think of getting away from single-track limitations when it becomes necessary to run cars on 15-minute intervals in each direction.

Among eastern interurban lines the population density tends to warrant double-tracking at a comparatively early period, so that it is almost certain that limited service would be both profitable and safe if inaugurated on broad-gauged lines. It would seem that a line like the Boston & Worcester, which is now being double-tracked in the last five miles of its entire length, ought to offer a most attractive field for the limited car. The local running time between these two cities, 49 miles apart, is 2 hours and 15 minutes against one hour by the parallel steam line's express. The fares in the electric service are practically half those of the steam line, the latter having lately reduced its passenger tariff to 90 cents each way after many years of operation at \$1. The institution of limited service on the completed double-track line, which has something like 30 miles of private or reserved right of way, ought to result in securing a large share of the business traffic which at present patronizes the Boston & Albany steam service, on account of its fast express service. Judging from what has been accomplished in other sections it would seem that a limited schedule of possibly one and one-half hours at certain times of the day might be well worth attempting in the case cited as illustrative.

Many of the interurban lines of the east are operated upon the public highways with relatively short distances between adjacent cities. Speeds are therefore limited to a maximum of from 30 to 40 miles per hour at the outside, and with the absence of long, clear stretches of interurban track through sparsely settled territory, it is difficult to inaugurate a service with few stops. With the frequent headway maintained in these populous communities it is, of course, a question how far limited service would be desirable. As far as the provision of through cars of superior design, comfort and equipment goes, the various foreign cars entering Boston, Salem, Lexington, Lynn and other points partake of the nature of limited service, and for such populous communities perhaps this is the nearest approach to it that is possible. But one might as well face the fact that for runs of from 20 miles and upward steam competition for the money of those whose time is most valuable cannot be met without genuine high-speed service, not necessarily record-breaking maximum spurts, but giving high average schedule speeds through the elimination of all but the most important local stops.

The question of fares on limited cars is one of no little difficulty, but if the service is distinctly superior to that of the locals, if more expensive equipment and more luxurious fittings are used, there is certainly reason for at least a slight additional charge. Stiffening the rates somewhat for through business tends to discourage short-distance riding from town to town and thus helps in the maintenance of fast schedules. Under eastern conditions, however, it is doubtful if excess fares for express service would be generally acceptable to the public, which has been educated to standards of car frequency and fixedness of fares only possible in the most thickly settled districts. Experience alone in the different parts of the country is capable of determining the ultimately best policy in regard to limited rates. It goes without saying that the fares must be enough to pay for the service given, and in a rough sort of way this means an earning of from 30 cents per car-mile upward. Forty or 50 cents per car-mile is much nearer the line of assured profit when one attempts to estimate the increased fixed charges accruing upon limited cars on account of their high standard of attractiveness, the extra cost of motive power capable of running the car at 60 miles per hour maximum speed, the cost in some cases of additional power station and distrib-

uting facilities, improvement in roadbed and possible delays to local traffic by limited cars when off schedule.

TRANSFORMER TESTS ON ELECTRIC RAILWAYS.

The testing of power plant and substation equipment on an electric railway is necessary for two principal reasons: to make sure that contract requirements are met by the manufacturers and to locate any unusual losses which may be seriously impairing the efficiency of the mechanical and electrical system. In many cases it is sufficient to send a representative of the road to the factory to carefully observe the tests of the manufacturer's engineers and to deduce from the figures so gained the degree with which the specifications have been followed. Other instances arise in which the best policy is to defer final acceptance until tests have been made upon the equipment under actual service conditions.

The importance of the transformer in electric railway operation is so great at the present time that detailed knowledge of its behavior when set up under service conditions is well worth securing on any system which aims to reduce its power cost to the minimum. On account of the somewhat involved relations existing between the transformer, primaries and secondaries, fewer tests have been made on this equipment by operating engineers than upon steam engines, turbines, gas engines and generators. The modern large-capacity transformer is a remarkably efficient device operating close to 98 per cent at full load and there is obviously little hope of improving its economy further. It is none the less desirable, however, to find out exactly what the efficiency is in a given transformer; to measure the temperature rise under various conditions of loading; to test the insulation of the windings, the potential ratios of windings and taps, the polarity and the regulation in voltage under various loads. These are the essential data which it is desirable for an operating company to have, but if more detailed analyses are desired tests may be made of core loss, copper loss, impedance and circulating current on transformers which are intended for parallel operation.

Probably the simplest and best way for an electric railway company to test its transformers is to actually place them under full-load or partial-load conditions with water rheostats as energy absorbers. From the standpoint of power cost it is, of course, more expensive to dissipate energy in this way than to adopt the so-called "pumping-back" methods of the manufacturers' testing departments which consume only the energy required to make up the core and copper losses.

The actual loading method carries the merit of extreme simplicity; it avoids complicated connections, obviates the necessity of bearing in mind a rather difficult course of reasoning during the tests and calls for no intricate adjustment of the rather limited supply of instruments available on the electric railway system. With an engineering department sufficiently skilled in making electrical tests it may work out in some cases that the best plan is to carry out "pumping-back" tests, but under average conditions the simple expedient of loading the transformer and measuring the quantities wanted is certainly the straightforward way to solve the problem. The larger the transformer the more expensive it becomes to make heat runs upon it at full load and the more probable it is that the engineering staff will have the time and skill necessary to make the "pumping-back" test.

Transformer efficiencies are readily obtained by dividing the output in watts on the secondary winding by the input of the primary as determined by various loadings by wattmeter located on each side. Voltmeter, ammeter and frequency readings are desirable to show that the conditions are normal. Temperature rise may be measured on exposed surfaces by thermometers wrapped in wick, but the only accurate way to get at the temperatures of the inner coils is by calculation

from the rise in resistance. Resistance measurements should be made at least every hour for this purpose on both primary and secondary windings, cutting the transformers out of circuit as short a time as is possible.

Regulation is easily determined by comparing secondary voltage readings with varying loads. In the absence of a special insulation testing set, two other transformers, carefully insulated, may be disconnected from the line and placed with their primaries in series and secondaries in parallel, the latter being excited either from a third transformer secondary or from some other source. Double normal voltage may thus be applied between the primary winding and core or frame, or between the primary and secondary windings. In the "pumping-back" method of testing the heating due to the core loss may be determined by open-circuiting the primary and applying normal voltage to the secondary, and the heating due to the copper loss is obtained by short-circuiting the primary and applying just enough voltage to the secondary to overcome the impedance and cause full-load current to flow in both windings. With air-blast transformers separate open-circuit and short-circuit heat runs give almost the same temperature rise for core and copper respectively, as when the two tests are applied together. Oil transformers do not give as consistent readings in this respect, hence the full-load test is preferable. In testing air-blast transformers the speed of the blower motor and air velocity should, of course, be recorded at frequent intervals, as well as the weather conditions.

Report of Treasurer of American Street and Interurban Railway Manufacturers' Association.

The report of Edwin H. Baker, treasurer of the American Street and Interurban Railway Manufacturers' Association for the period from February 9, 1906, to December 28, 1906, has just been published. It shows receipts and disbursements as follows:

RECEIPTS.	
By balance from 1905.....	\$ 350.26
Assessments at \$35.....	9,590.00
Sale of extra space at 5 cents per sq. ft....	2,558.60
Sale of extra badges at \$5 each.....	1,110.00

Attached to the report is a certificate from Patterson, Teale & Dennis, certified public accountants, of New York, stating that the foregoing account of the treasurer's receipts and disbursements "is in accordance with his record and that proper and sufficient vouchers have been produced to us for all disbursements." Also "that the balance of cash on hand agrees with the certificate given us by the bank where the funds are deposited."

SHOP PRACTICE AT MEMPHIS.

The extensive improvements that are being made by this company include additions to the power house and car barns, a new car storage house and rearranging the tracks and special work leading into these buildings. The building now occupied by the offices, shops and car houses is 375 by 320 feet

sides of the property. This wall, which is shown in one of the engravings, is built of concrete mixed to the proportions of 1-3-5. It is 4½ feet thick at the bottom, and is battered to a thickness of 2 feet at the top. A pipe railing surmounts this wall. The new building is 205 by 372 feet in floor dimensions and has side walls 18 feet high. The materials of construction consist of concrete for foundations, brick for the

Shop Practice at Memphis—Wheel with Form for Winding Coils, Also Wire-Cleaning Press.

Shop Practice at Memphis—Method of Storing Field Coils and Armatures.

in floor area. This structure, erected several years ago, has, as a result of the rapid growth of the system, become too small to accommodate the large amount of rolling stock which has since been acquired. In view of this condition it has been found necessary to make the changes and additions as described herewith.

superstructure, steel trusses and tile roofing. The foundations have been sunk deep enough to allow pits to be excavated under the tracks, should it be necessary to do so.

New Car Storage House.

The new car storage house now under construction is

The building is divided into three equal-sized bays, by two brick partitions. The roof of each bay is independent of the adjoining roofs. In the east wall at a height sufficient to allow the free passage of cars under it a box girder has been in-

Shop Practice at Memphis—Pendulum Pile-Driver.

Shop Practice at Memphis—View in Pit Showing Car Body and Pit Hoists in Use.

located immediately south of, and across the street from, the present building. The ground on which this building stands is about 11 feet above the streets to the south and west. This necessitated the building of a retaining wall along the two

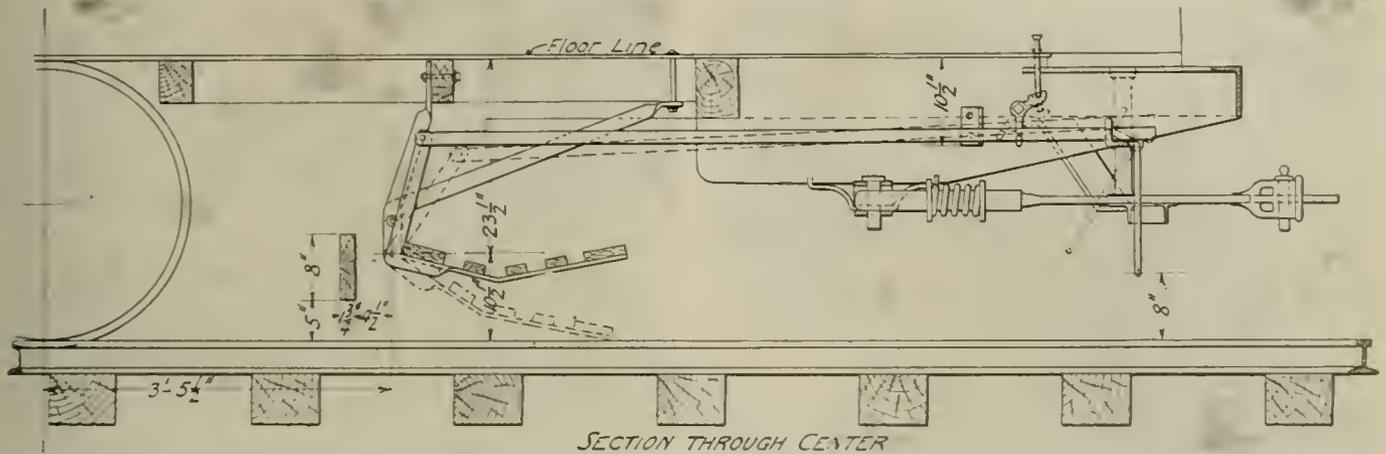

served in the brick wall so that if necessary entrance curves can be put in at this end.

A general ground plan shows the relative location of the

shop and storage buildings. With the completion of the new buildings the tracks nearby will be relaid so as to provide double-end entrances to the shops. This work presents an interesting arrangement of curves and special track work. The tracks now occupying Spring street, just south of the shops, are to be taken up and thrown back of the south property line of the street and a third track is to be laid from which will

valves and unions so that they can readily be disconnected and repaired in case of leakage.

The car-body and armature hoists are shown in detail in the accompanying illustrations. The main cylinder of each type of hoist is 10 inches in diameter. Inside the cylinders of the car hoists are plungers 4 feet long, made of 6-inch pipe filled with hard wood to a point 12 inches from the top. At the

Shop Practice at Memphis—Section Through Lower Front of Car Showing Automatic Fender and Trip in Normal and Lowered Positions.

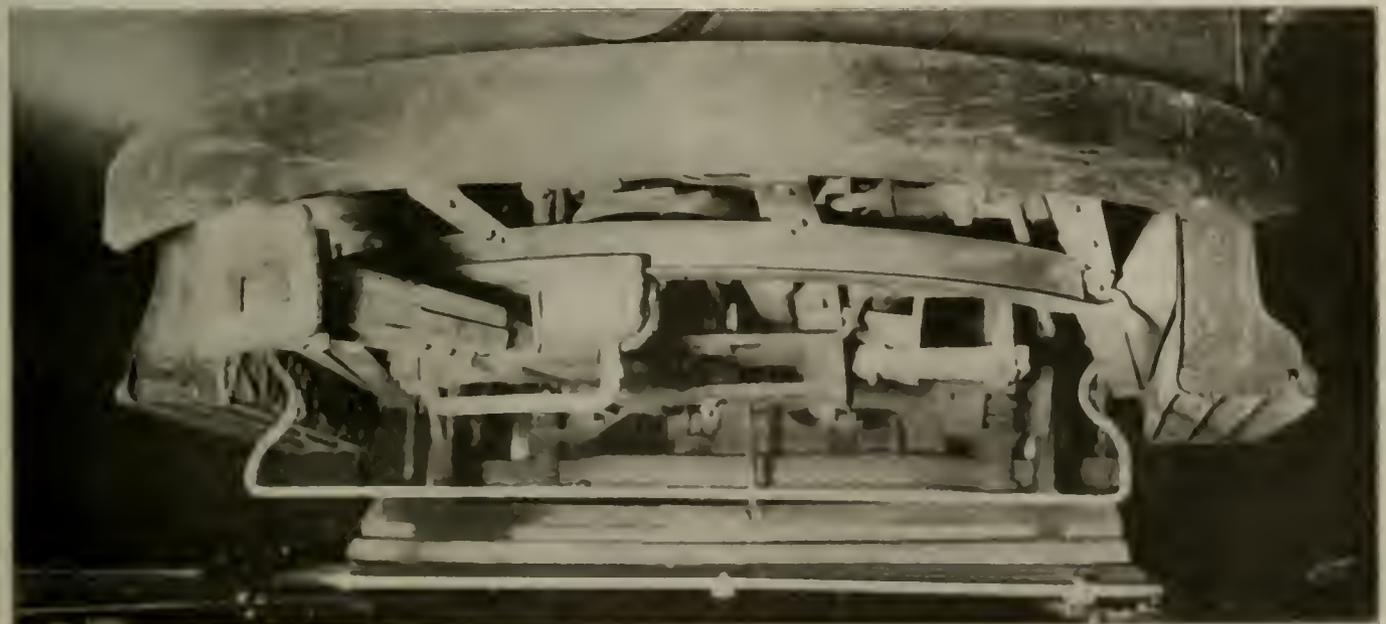

lead all switches to the shops and barns. This layout is intended to facilitate the switching of cars without interfering with traffic on the street. In developing the double entrance to the main building it was necessary to tear out the south wall and leave open this entire end of the building.

Shop Methods—Air Hoists.

The shops and pits throughout the old buildings are provided with air hoists. The air supply is furnished by a National Electric compressor of 200 cubic feet of air per minute capacity. It is connected direct to a 5 by 18-foot reservoir

bottom of each plunger is a leather gasket locked with a cast iron washer. A square head, bolted to a 5-inch pipe which fits in the 6-inch pipe and rests on the block filling, serves as a cap to the plunger. This cap may be removed when the hoist is not in use. Air is admitted at the bottom of the cylinders by a 3/4-inch connection. Four such hoists, constituting a set, are placed at such points in the shops where heavy repair work is done.

As will be noted from the illustrations the armature hoists are very similar in design to the car-body hoists. They have

Shop Practice at Memphis—Front of Car Showing Radial Draft Rigging and Automatic Drop Fender.

on which a uniform pressure is maintained by the use of an automatic governor.

The shop air-supply main leading from the reservoir is 2 1/2 inches in diameter. This line extends through the machine and carpenter shops. Branch lines connect with the main and furnish air for operating the air lifts, car body hoists and the armature jacks in the pits. The main and branch leads have

10-inch cylinders, 6-inch plungers and have a lifting range of about two feet. These hoists are set on trucks and may be run to any part of the pit space.

Armature and Field Coils.

The winding-room practices are of unusual interest inasmuch as the expense of maintaining this department is exceedingly low. All armatures and fields used on this com-

pany's equipment of about 300 cars are wound and kept in running order by three men. The conditions that make this possible are due not entirely to the efficiency of the work turned out in this department but particularly to the thorough method of motor inspection that is in vogue on this property. On page 117 of this issue will be found an inter-

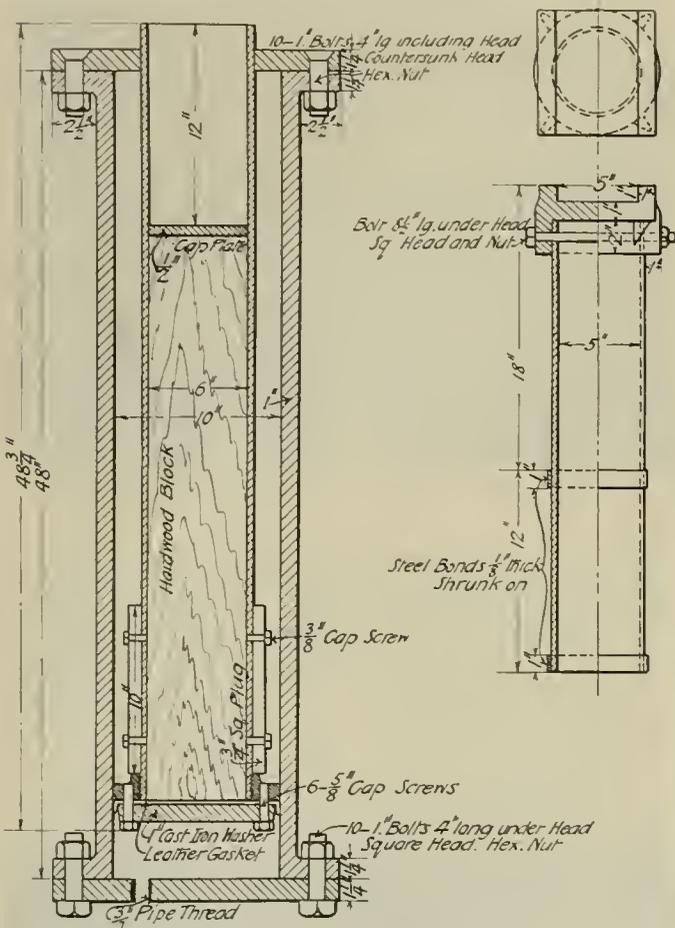

be taken as a fair illustration of the work done each month in this department, follows:

Field Coils.

In western Tennessee February is considered as one of the most severe months for motors, but it is an interesting fact that since August, 1905, only 67 field coils have been lost on the Memphis lines. However, in anticipation of trouble, the company plans to have in stock a large number of field coils that can be pressed into immediate service. These are made at times when other work in the winding room is light.

Shop Practice at Memphis—Working Drawing of Air Hoist for Lifting Car Bodies.

esting description of the inspection methods as used at these shops.

The motors used include 260 G. E.-800, 18 G. E.-1,000, 96 G. E.-80, 144 G. E.-67 and 156 G. E.-57. About one-half of these motors are in daily use. Notwithstanding this fact the shop records show that from August 1, 1905, to January 15, 1907, only 86 armatures were rewound. These were divided as follows: Three of type-67, six of type-57, seven of type-1,000, and seventy of type-800. These figures do not include the armatures that were repaired by patching or by the use of jumpers, but only those that it was necessary to break down and wind with new coils.

Armature Repairs.

The foreman of the winding room keeps a book record of all work done in his department. This enables him to make a detailed monthly report to the master mechanic.

When an armature is sent to the winding room for repairs it is classed under the head of mechanical, electrical or inspection troubles, according to the nature of the defects. The mechanical and inspection heads are closely allied, but are segregated merely to designate the armatures that have mechanical defects from those demanding nothing more than a cleaning or a coat of paint.

The report for the month of December, 1906, which can

Shop Practice at Memphis—Firing End of Sand-Drier.

On January 15, 1907, the company had in its winding room 88 field coils for type-800 motors, 71 for type-67 motors, 12 for type-57 motors and 14 for type-1,000 motors.

The method of winding field coils is unique in many respects. Between the layers of wire forming a coil, Standard varnish is applied with a brush and sheet asbestos is used in filling. After the winding has been completed the terminal plates are soldered on and insulated, and the coil is

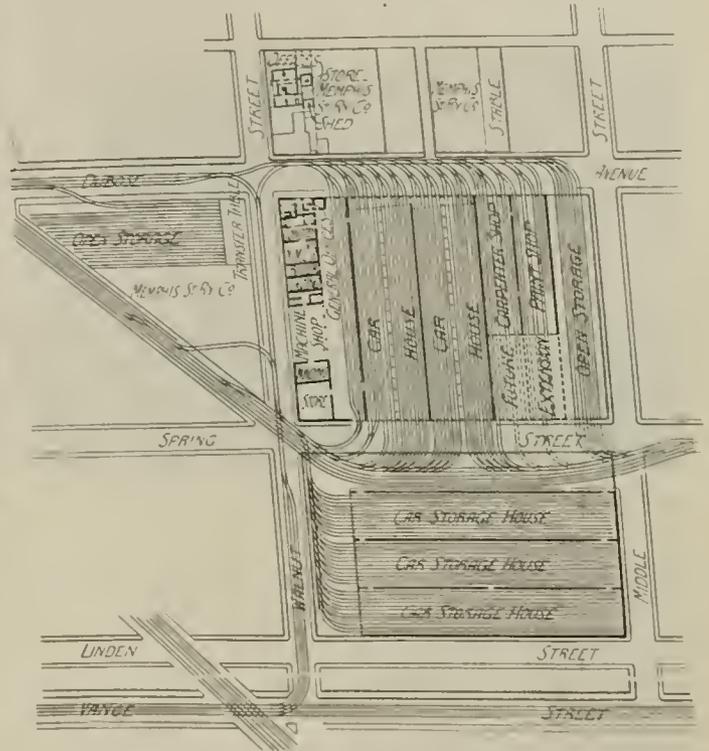

thrown into a pan of Standard varnish where it is allowed to soak until the insulation is thoroughly saturated. The coil is then placed in the bake-oven and subjected to a temperature of 195 degrees F. during the night. The following day the coil is again dipped in varnish and allowed to air-dry. The webbing is then applied, the terminal plates covered with asbestos tape and the coil dipped in a vat of Sterling black, air-drying varnish where it is left until bubbles cease to appear. It is next hung near some hot-water heating pipes and allowed to dry. Later, it is again dipped in the air-drying varnish and air-dried after which it is ready for service.

All armature coils are wound with double cotton-covered wire. In winding coils for armatures of motors types 67, 57 and 50, each coil is insulated separately by an application of insulating varnish and a layer of fish paper. The forms for these types are worked on the face-plate of the field-winding lathe.

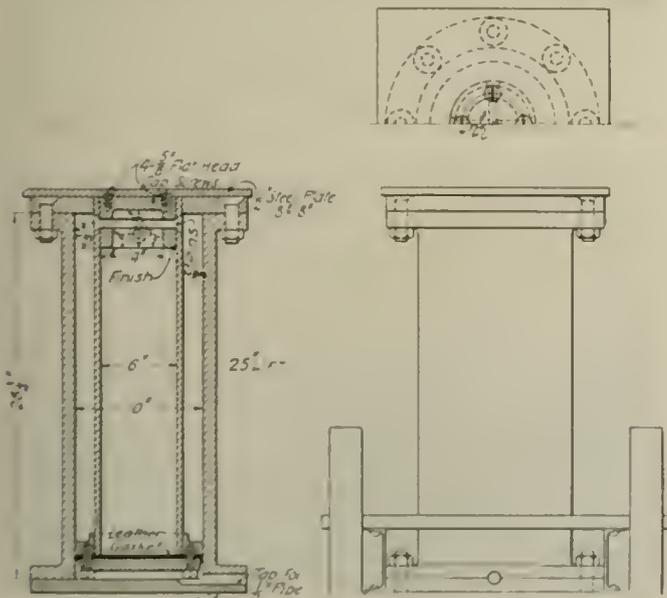

The forms for winding the coils for the armatures of motors types-800 and 1,000 are used at the work-bench, which is located along one side of the shop. After coils of these types are wound clips are applied to hold them rigidly. The part of the coil that fits in the armature slots is then dipped in a pan of varnish, after which it is baked for four hours under a temperature of 195 degrees. When taken from the bake-oven the clips are removed, the coil is placed in a shaper and given the required form. This shaper is made of wood and is composed of two parts, male and female, shaped properly to form these types of coils. It is worked by foot lever. After coming from the shaper the coil is wrapped in oiled linen and is taped. It is then passed to a lead-shaping machine composed of two adjustable rollers and thence to the table where the leads are tinned. The coil is then dipped in a vat of M. I. C. compound No. 3, after which it is air-dried. After passing through a hand-press shaper and being again dipped in paraffine it is ready for use.

In making coils for type-1,000 armatures the practice of

it is not considered necessary to subject them to heat after they have been assembled in the armature laminations. In winding the 800 and 1,000-type armatures mica strips are used at the corners where the coils break over the frame. Otherwise the usual methods of winding are followed. In capping the rear end of the armature five layers of paraffine paper and four of mica are inserted under the shield. At the

Shop Practice at Memphis—Layout of Offices, Shop and Car Houses at Walnut Street and Dubose Avenue.

Shop Practice at Memphis—Working Drawing of Air Lift with Truck for Use in Pits.

letting the short lead come out from the center of the coil has been discontinued and it is now brought out at the side in a manner similar to that of a type-800 coil. By this practice it has been found that the cost of labor per coil can be reduced and it is claimed better results are also obtained.

Contrary to usual practice the newly wound armatures are never baked. As stated in another paragraph, much care is taken in seasoning the armature coils as they are made and

commutator end of the armature, tape is applied to the sharp corners of the laminations and a good grade of drilling used as a wrapper. The bands are then wound on over strips of mica and after the armature is painted it is ready for service.

The armature banding is done in a small lathe. An ingenious tension roller has been devised to facilitate the banding work. This tension device consists of a casting about 5 by 10 inches, on which 8 rollers 1 inch in diameter are bolted into two parallel rows. The roller frame is designed to be fastened to the bed of the winding lathe. When the banding work is begun the band wire is led from the roll to the tension roller and wound around as many of them as necessary to furnish the desired tension to the band.

Sand Drier.

A very satisfactory sand drier, as illustrated, is in use at the Memphis shops. The sand room occupies a building, 15 by 25 feet, that is separate from the other buildings and near the main tracks in front of the shops. The firebox of the drier is a 12-foot length of 30-inch cast-iron water pipe which rests on a foundation of brick. At the rear end of the pipe is a brick chimney which extends from the ground to a point a few feet above the roof. A sand hopper made of sheet steel and having a capacity of about six cubic yards of sand stands on top of the firebox. The sides of the hopper extend below the center of and about 1/2-inch from the outside surface of the pipe or firebox. A window in the south side of the building admits of sand being shoveled from a car or wagon directly into the hopper.

When the drier was first built no provision was made for distributing the heat in the firebox and it was difficult to keep the flames from going up the chimney. Since that time, however, two baffle plates have been inserted near the rear

of the tubular firebox. These give the fire a down draft and materially aid in getting the largest amount of available heat from the fire. As sand dries it sifts down from the hopper into the sand room through the $\frac{1}{2}$ -inch space between the sides of the hopper and the pipe. The sand used is obtained from the bed of the Mississippi river.

In addition to the regular track-sanders with which each car is equipped, a sand car is operated. This car distributes

sides of the vestibule, thus giving the bar a lateral motion the width of the car. Under the carrier is a safety guard which prevents the drawbar from being forced down sufficiently to injure the springs which hold it in position. It requires a weight greater than 200 pounds to compress the springs.

When the drawbar is in normal position, the carrier relieves the coupling links of the weight of the drawhead and

Shop Practice at Memphis—Coil-Winding Bench with Storage Above.

Shop Practice at Memphis—Arrangement of Dripping Vats and Drying Coils.

sand as it is taken from the river to those tracks laid on grades. The car leaves the barn at 3 a. m. daily and is kept busy during the early hours. The sand is shoveled by hand into the hoppers which lead to the rails.

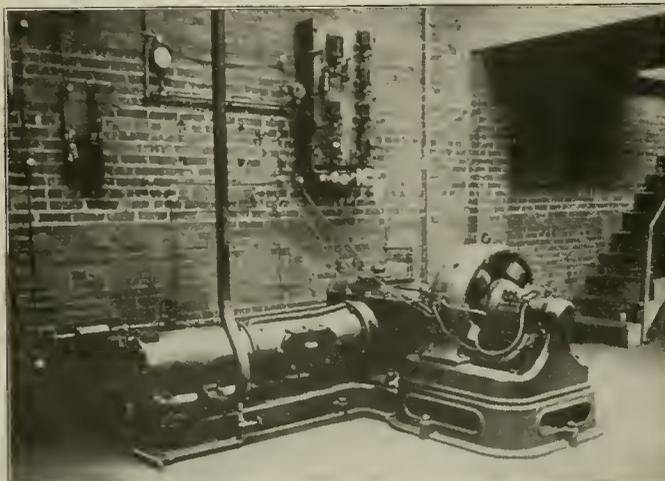

Automatic Drop Fender.

An automatic fender which, when in action, trips and drops to the rails, is shown among the illustrations. This fender is a product of the Memphis shops.

A radial drawbar carrier has been adopted for use in arranging the draft rigging of all of the double-track motor and trailer cars in use on the system. The device was made in the shops of the company. The essential parts of the car-

always gives the heads a square bearing with each other thus preventing the uneven wearing away of any of the parts. In handling heavy trailer cars this rigging has proven very efficient. Van Dorn drawbars, No. 5, are used by this company.

The Memphis Street Railway Company has a number of pile trestles to maintain on some of its lines, and has for use in this work a "pendulum" pile driver, built in the company's shops; with this type of driver piles can be driven with a batter, which is desirable in this class of bridge work. The driver is mounted on a 32-foot flat car in such a way that the leads and lead-supports can be lowered to the deck without trouble. The main leads are made of 4 by 4-inch timbers, 22 feet long, and are faced with 2-inch oak strips which serve

Shop Practice at Memphis—Shop Air-Compressor with Regulator.

Shop Practice at Memphis—New Car Storage House with Retaining Walls.

rier consist of two hollow cast-iron carrier castings ($6\frac{1}{2}$ inches long, $3\frac{3}{8}$ inches high and made of $\frac{1}{2}$ by 2-inch cast iron), inside of which are located two 2-inch coil springs, made of No. 3 gauge wire, and a drawbar yoke with sets on the springs. The yoke is given an up and down motion of about three inches. The draw-bar rigging passes through this yoke and is bolted by a tail-bob pin to the draught timbers. The two carrier castings are bolted together with the upper side loosely clamped to a radial I-beam track that extends to the

as guides for the hammer to travel in. The hammer weighs 2,000 pounds. This is raised in the guides by means of manila ropes attached to the drum of a $5\frac{1}{2}$ by 8-inch hoisting engine, made by the American Derrick & Hoist Company. The "A" brace shown in the illustration is made of 4 by 5-inch timbers. A snake rope is provided for lifting the pile into position for driving. When the driver is not in use or when it is being shifted from one point to another the derrick is lowered onto

the car. The car is hauled as a trailer by one of the four-motor cars. On the Raleigh Springs line the company has a trestle over the Wolf river, 1,300 feet long which it is often necessary to repair. The driver has proven invaluable in doing the work.

The Memphis (Tenn.) Street Railway Company is controlled by Isadore Newman & Sons, but it is operated independently of its affiliated properties also controlled by the same bankers. The officers of the Memphis Street Railway Company are: J. H. Tutwiler, president; J. H. Watkins, vice-president; W. H. Burroughs, secretary and treasurer; E. W. Ford, general superintendent, and Ford Bacon & Davis, engineers.

STANDARD RAIL SECTIONS FOR PAVED STREETS.*

BY C. GORDON REEL, GENERAL MANAGER, KINGSTON CONSOLIDATED RAILWAY.

Before enumerating the many advantages of standard rail sections for paved city streets it will be instructive to consider for a moment the history of the so-called girder rail which, by the way, is now happily obsolescent.

In the horse-car days strap rails were used which were spiked directly to wooden stringers, these in turn being carried on cross-ties. The shape of the strap rail then used was very similar to the top of the girder rail, and inasmuch as this strap was supported throughout its entire width the design did not violate any fundamental principle of mechanics. These principles were immediately violated, however, when the web and base were added to the strap rail, thus producing the girder rail, because the web was placed beneath the middle of the top which brought it directly under the gauge line. The general result is that these rails have the following bad features:

1. By reason of the unscientific arrangement of the metal in the rail section the head is shallow, resulting in short life, and the flangeway is necessarily shallow, which is very objectionable as regards the operation of interurban cars; furthermore, the projecting wagon tread makes the rail difficult to spike. It is safe to assume that fully 50 per cent more metal is required in such a section than is required in a standard section for a rail of equal carrying power and life.

2. The web being over on one side of the head the weight is carried on a sort of projecting cantilever which results in an absolute inability to maintain joints. There is not a railroad man here who does not know that it is impossible to hold girder rail joints, however heavy the rails may be, or however elaborate the system of splice-bars and bolts. Every large city system which has used heavy girder rail has demonstrated this fact beyond the possibility of contradiction.

3. The wheel load being carried over to one side of the web causes the rail to tend to move out from the center of the track when the load is on it. The only way this tendency can be overcome is to use numerous tie-rods and thus hold the rail bodily from moving sideways. Correct engineering would require a section with no such tendency to lateral movement. The effect of this lateral movement is that the tracks get wide gauge and the pavement is loosened generally.

4. When a heavy wheel-load is impressed upon the head of a girder rail there is an inevitable bending moment which must be overcome in the structure of the web. No amount of tie-rods can prevent this stress in the web and in fact the greater the number of tie-rods the weaker the web becomes and just where it should be strongest—similarly when a heavy truck wheel bears down on the end of the projecting flange-way the bending moment is in the opposite direction. Where traffic is heavy these alternate stresses have so "fatigued" the metal that longitudinal cracks have appeared along the middle of the web.

Advantages of T-Rail Sections.

All of the foregoing difficulties evaporate into thin air upon the introduction of T-rail sections. The advantages of using T-rails are without number. It is simply the substitution of a correct design for an incorrect design, an intelligent section for a clumsy section which can only carry present wheel-loads when weights per yard run up to almost 150 pounds, whereas the very heaviest steam railroad equipment is easily carried on standard rail sections weighing less than 100 pounds to the yard. A few of the principal advantages of the T rail might be summarized as follows:

1. Its symmetrical section, the load coming directly over the center of the rail, its full deep head, ensuring long life, and the unlimited flangeway, also the fact that it is easily spiked to the tie.

2. The long angle-bar joint with T-rail sections is practically perfect.

3. The load being symmetrical there is no tendency for the

tracks to get wide gauge or to move around in the street, and therefore no tendency for the pavement to become loose along the tracks. It is clear that the construction which requires least repairs is best for the company as well as the community which it serves.

4. The flangeway being gritty a vehicle turns out of the tracks with the greatest ease.

5. T-rail tracks are less noisy. In Montreal the residents have insisted on T-rail for this reason.

From the foregoing it is evident that there can be no question as to the great advantage of T-rails over girder rails.

We will now consider for a moment the still further advantages which the standard rail sections possess over the high T-sections:

1. The standard sections are more substantial in every way. They have a larger head, a thicker web and a wider base; and as has been demonstrated by years of service, they realize the maximum efficiency in rail design.

2. The all-important question of joints, for, after all, the life of any construction in a street is measured by the life of the joints, is solved to the best advantage with the standard sections.

3. Some city engineers, while approving of the high T-sections, have objected to the standard sections on the theory that these latter are not sufficiently deep for paving, but, as we all know, there is nothing in this objection because there is no reason why the pavement cannot extend below the base of the rail. We are all familiar with such construction—it is standard in many cities where deep block pavement is used. With brick or asphalt pavement, of course, the objections of insufficient height cannot be raised.

4. The standard sections not being so slim and topheavy have a way of staying where they are put to a much greater extent than the high T's.

5. From a standpoint of economy—since the mills are able to produce standard T-sections at a considerably less cost per ton than the high T-sections in a ratio of 28 to 36, we are enabled to buy a 90-pound standard section for the same price as a 70-pound high T-section, and by using the standard section get a track which will outlive the high T twice over. If we now assume that a 90-pound T-rail is equivalent to a girder rail of 50 per cent more weight (which assumption is by no means extravagant when we consider the question of eccentric loading as compared with symmetrical loading, and the impossibility of maintaining the joints of girder rails as compared with the practically perfect joint of the standard rail) and then apply the ratio of cost per ton we find that a better result is obtained with a standard section than with a girder section costing something like 93 per cent more than the standard. This money might better be spent some other way than literally sunk in the ground.

When a company proposes to lay T-rail to replace girder it is apt to meet with some opposition on the theory that ruts will wear along the rails. This objection seems reasonable on the face of it, but the fact is that in spite of all predictions of ruts they fail to appear. There seems to be no greater tendency for a rut to form along a T-rail than along the outside edges of a girder rail.

The best argument in favor of T-rail construction is that there is not a single instance on record, where it has been properly laid, that it hasn't proven satisfactory to the city authorities. On the contrary, wherever tried it has been adopted, as the accompanying information from engineers of large cities throughout the country proves:

Data on the Use of T-Rail.

Amsterdam, N. Y.—F. E. Crane, City Eng.—70-lb. T-rail with brick block, concrete foundation, 6 years service, no tendency to wear ruts.

Battle Creek, Mich.—E. N. Hunt, City Eng.—6 and 7-in. T-rails. Rails should be at least 5 in. high.

Brooklyn, N. Y.—J. H. Calderwood, Brooklyn Rapid Transit Co.—Has no T-rail, a T-rail best to maintain. High T gets out of gauge. Standard 80 or 90-lb. T high enough.

Brunswick, Me.—E. D. Reed, Lewiston Brunswick & Bath Ry. Co.—With Belgian block would use T-rail on concrete stringer 12 in. wide, 14 in. deep, the straps 5 ft. apart.

Buffalo, N. Y.—T. W. Wilson, International Traction Co.—T rail used exclusively in several large cities in central west. Milwaukee permits no other.

Cincinnati, O.—6 and 7-in. T rail on blocks resting on sawed ties, 3-ft. centers laid in concrete, with ordinary block paving.

Cincinnati Northern Traction Co.—80 lb. T rail ties, brick filler against web.

Dayton, O.—Robert E. Kline, City Eng.—T-rail satisfactory and standard for all paved streets.

Davenport, Ia.—Street Railway Journal, Permission granted for T-rail, all streets.

Delaware, O.—J. S. Dilke, City Eng.—4 in. T rail on 1 in. block special flange—block and filler bricks. "Better than grooved rail."

Denver, Colo.—John A. Boeder, Denver City Tramway—1" x 6 in. 72 lb. T rail in concrete. Rail 60 ft.; low 24 in. centers, gravel 8 in. below ties; double row toothed blocks out 1/2". Single row beveled blocks inside. "Do not favor 7 in. 70-lb., too light in flange and web."

Erie, Pa.—B. E. Briggs, City Eng.—80 lb. T rail, several years service, entirely satisfactory.

*Presented at the quarterly meeting of the Street Railway Association of the State of New York, Buffalo, January 11, 1907.

Glens Falls, N. Y.—D. E. Van West, Hudson Valley Ry. Co.—Used 5-in. T-rail 3 years with special block; very satisfactory.

Hamilton, O.—E. H. Berry, Eng. Roadways.—Several miles standard T-rails in Hamilton; good results.

Indianapolis, Ind.—Blaine H. Miller, City Eng.—Uses 90-lb. T-rails in improved streets; saving in repairs vast improvement over old girder and grooved rails.

Kansas City, Mo.—Street Railway Journal; Kansas City Ry. & Lt. Co.—Adopted 80-lb. T-rail for brick-paved streets. No more girder, special flange-brick.

Kingston, N. Y.—E. B. Codwise, City Eng.—If T-rail is high, no great objection, can be paved against; objects to low T-rail. Mauch Chunk, Pa.—Franz Mackl, City Eng.—Uses 70-lb. T-rail, special bricks inside; outside bitulithic blocks.

Memphis, Tenn.—J. A. Omberg, City Eng.—Favors 90-lb. T-rail, special blocks.

Milwaukee, Wis.—C. J. Poetsch, City Eng.—“We use T-rail on all streets.”

Minneapolis, Minn.—Andrew Rinker, City Eng.—Street railways now use T-rail exclusively; public interests best subserved; latest type is 80-lb. T-rail, wooden ties bedded in concrete; satisfactory.

Montreal, Can.—John R. Barlow, City Surveyor.—T-rail reduces vibration; uses 86½-lb. T-rail 5½ in. high on concrete, no ties.

New Haven, Conn.—Calvert Townley, Elec. Expert, New Haven System.—T-rail used on greater portion of tracks and used exclusively on all new work in Connecticut except in Hartford. State commission endorses T-rail.

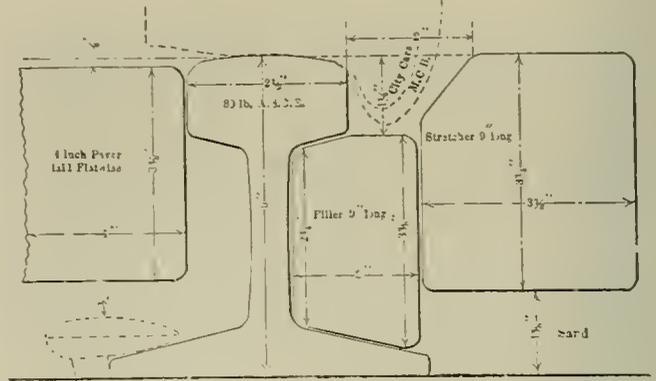

Ottawa, Can.—Newton J. Ker, City Eng.—7-in. 80-lb. T-rail, ties with 8-ft. centers, no tie rods; sandstone blocks for paving. 5 in. deep on a 6-in. bed of concrete with 1-in. sand cushion between. Later use 90-lb. 62 and 64-ft. T-rail. Blocks cut to fit under head.

Rochester, N. Y.—Richard E. Danforth, Rochester Ry. Co.—Uses standard 70-lb. T-rail in Sandusky, O., which is now in per-

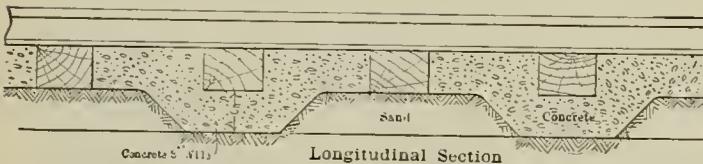

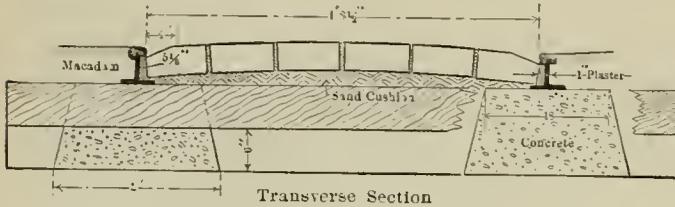

NEW YORK STREET RAILWAY ASSOCIATION.

(CONTINUED FROM PAGE 81.)

In introducing the paper on “Standard Rail Sections for Paved Streets,” Mr. C. Gordon Reel, general manager, Kingston Consolidated Railway, said that it had been proposed to lay the T-rail in Kingston in the belief that it was the best

Standard Rail Sections—Section of Special Filler and Stretcher Brick for 80-Pound Rail and Four-Inch Paving, Cincinnati Northern Traction Company.

Standard Rail Sections—Sections of T-Rail Construction with Special Paving Brick in Union Avenue, Schenectady, N. Y.

fect condition. Girder rails not allowed by the city; 5-in rail is satisfactory with standard vitrified brick pavement with a ½-in. cushion.

Schenectady, N. Y.—J. Leland Fitzgerald, City Eng.—Paving against T-rail with molded brick makes a solid construction; no excessive wear on brick at point of contact. Schenectady Railway has about 500 ft. of experimental track laid with 85-lb. T-rail.

Scranton, Pa.—Henry Jifkins, City Eng.—Considers T-rail the best for paved city streets. Has about 2 miles of 5-in. 56-lb. and 5 or 6 miles of 6-in. 65-lb. T-rail laid in concrete.

St. Paul, Minn.—L. W. Rundlett, Eng. Public Works.—T-rail used exclusively on paved streets; special-cut block with a groove for the flange bedded in concrete; very satisfactory.

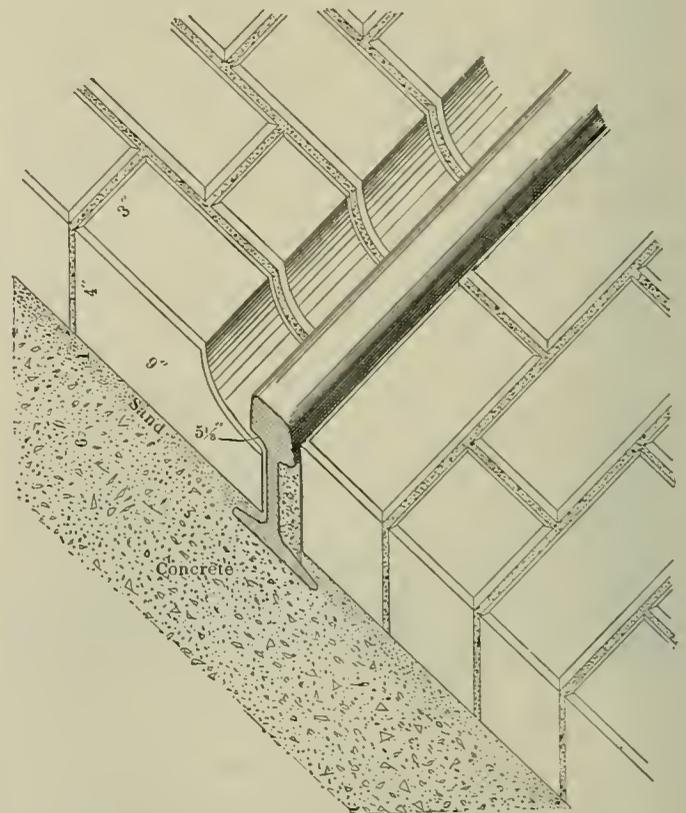

Tacoma, Wash.—Frank L. Davis, City Eng.—No girder, uses 6-in T-rail on all paved streets, 60-ft length; satisfactory.

Toledo, O.—F. J. Consaul, City Eng.—Heavy T-rail construction with special rail blocks properly fitted, superior to girder rails, because rigid and causes less frequent disturbing of pavement for repairs.

Worcester, Mass.—E. A. Engler, Worcester Polytechnic Institute.—T-rail is preferable to girder rail, because the metal in it is better distributed in the cross-section and weight of car is almost directly over the web. E. G. Connette, Consolidated Ry. Co.—90-lb. T-rail with vitrified paving blocks best, because continuity of rails is less easily disturbed at joints; lessens wear and tear to streets.

New York, N. Y.—Street Railway Journal.—Paving can be maintained better with T-rail; wear on paving is reduced; lessens number of collisions; reduction in broken wheels and axles on vehicles; stronger structure with less metal; reduction in joint troubles; easier riding track; less noise; less trouble caused by snow, ice and dirt; benefits villages and cities, because interurban cars can enter; refusal to permit T-rails on streets direct obstacle to the progress of a community. Milwaukee, Minneapolis, Denver, Indianapolis, Cincinnati, Dubuque, Ia., Battle Creek, Kalamazoo, New Haven and Montreal (Can.), are examples of satisfactory results obtained by the use of T-rail.

construction that could be put in the street. The usual opposition on the part of the civil authorities was met. During the last year data had been collected to prove the company's position. When the construction was proposed it was thought the company had a good case, and on looking into it further, it was believed there could be no opposition in the face of

Standard Rail Sections—T-Rail Construction in Montreal.

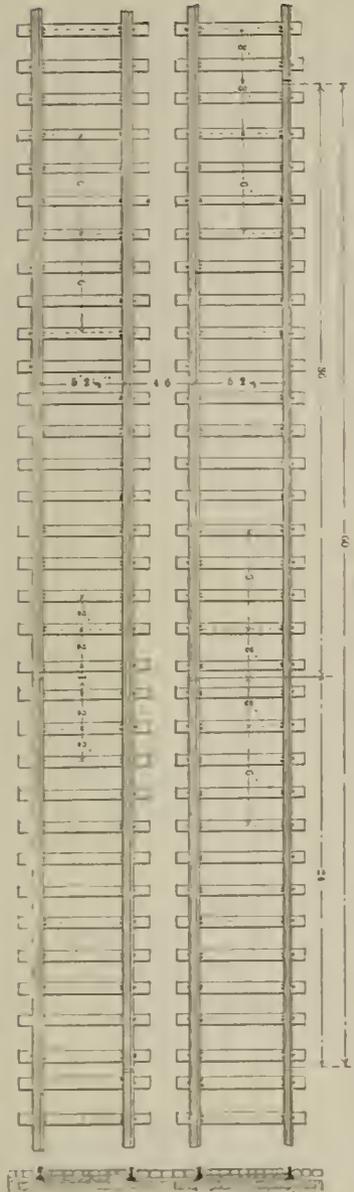

the data secured. He said he had written to nearly every large city in the country, and found this construction used exclusively in some of the most progressive and largest cities. If he should attempt to produce what he could in the way of evidence that would bear on the desirability of the

T-rail, there would not be an opportunity to do much else during the session.

(Vice-President Wilson in the chair.)

Mr. Reel presented his paper, as appears elsewhere, and at its conclusion explained several blue prints, which are reproduced herewith.

One engraving showed what it was proposed to use in Kingston, what had been used to some extent, and what had been arranged with the city authorities to go ahead with in the spring. Where they were going to put in T-rail in the present tracks, before the city objected, they proposed a style of construction using the present shallow block paving, as shown, and using a longitudinal brick along the rail. That kind of construction was not desirable. Any proper construction had the brick coming under the head of the rail up to the web. That was to be used until such time as the city will permit the use of the other paving. It now had macadam outside, and that would give a straight line to pave against. He also stated that the city engineer said he would not stand for that kind of a rail, because in the future, while the city used brick at present, they wanted to use deep stone paving and they could not do it if that kind of rail were used. The sketch was made to show how it was perfectly feasible to carry that rail on any depth of pavement. It would be reinforced concrete, but the reinforced concrete could be put into any depth, and the blocks go down as deep as desired. Another view was described as showing the construction that would be used when the city paved permanently, reinforced concrete beam and occasional steel rivets in the bed of concrete, with the rods down low out of the way and a form of brick which always come up to the web of the rail.

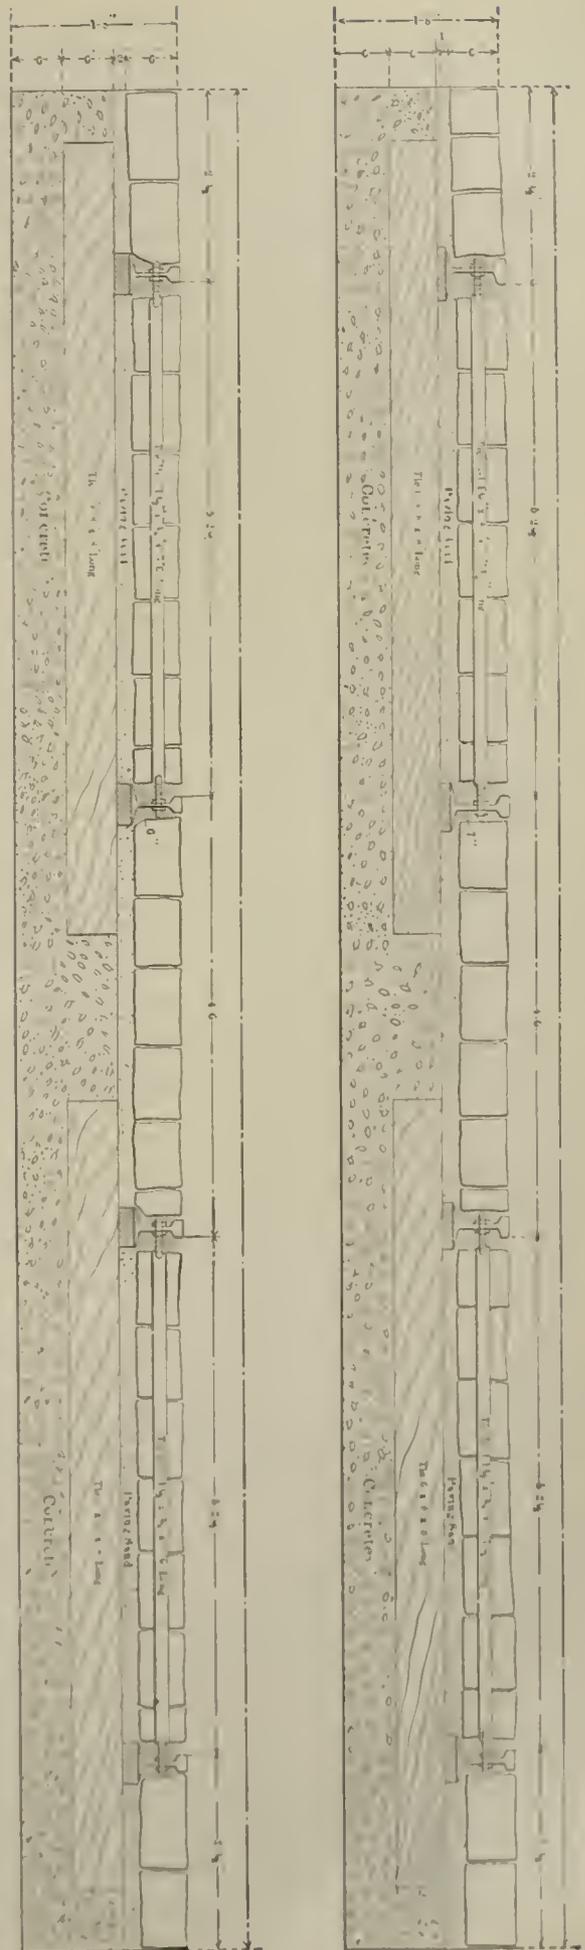

Another view shows a construction used by the Cincinnati Northern in Cincinnati. Mr. Reel thought for a permanent construction that was not the proper way to pave. They used two pieces, and he did not think that desirable. The sketch of the construction used in Montreal, where they have 86.5-pound standard rail in all streets, shows the use of what they call scoria block, which he thought a splendid block for the purpose.

The sketch from Cincinnati was brought to show how often all the block paving would go down below the base of the rail. The rail is carried on a block, and the stone paving projects below the base of the rail.

In connection with the paper Mr. Reel read letters from engineers in Montreal, Saranton, Schenectady and other cities, which are reproduced elsewhere.

Vice-President Wilson (in the chair) said that Mr. Reel had tackled the subject with more courage than almost anybody he had heard take the matter up before. Mr. Wilson gave in a few words his criticism of the T-rail style of construction. As far as the accommodation of the cars went, it was all right, but the fatal point in T-rail construction was the paving. He had had occasion to examine some track in

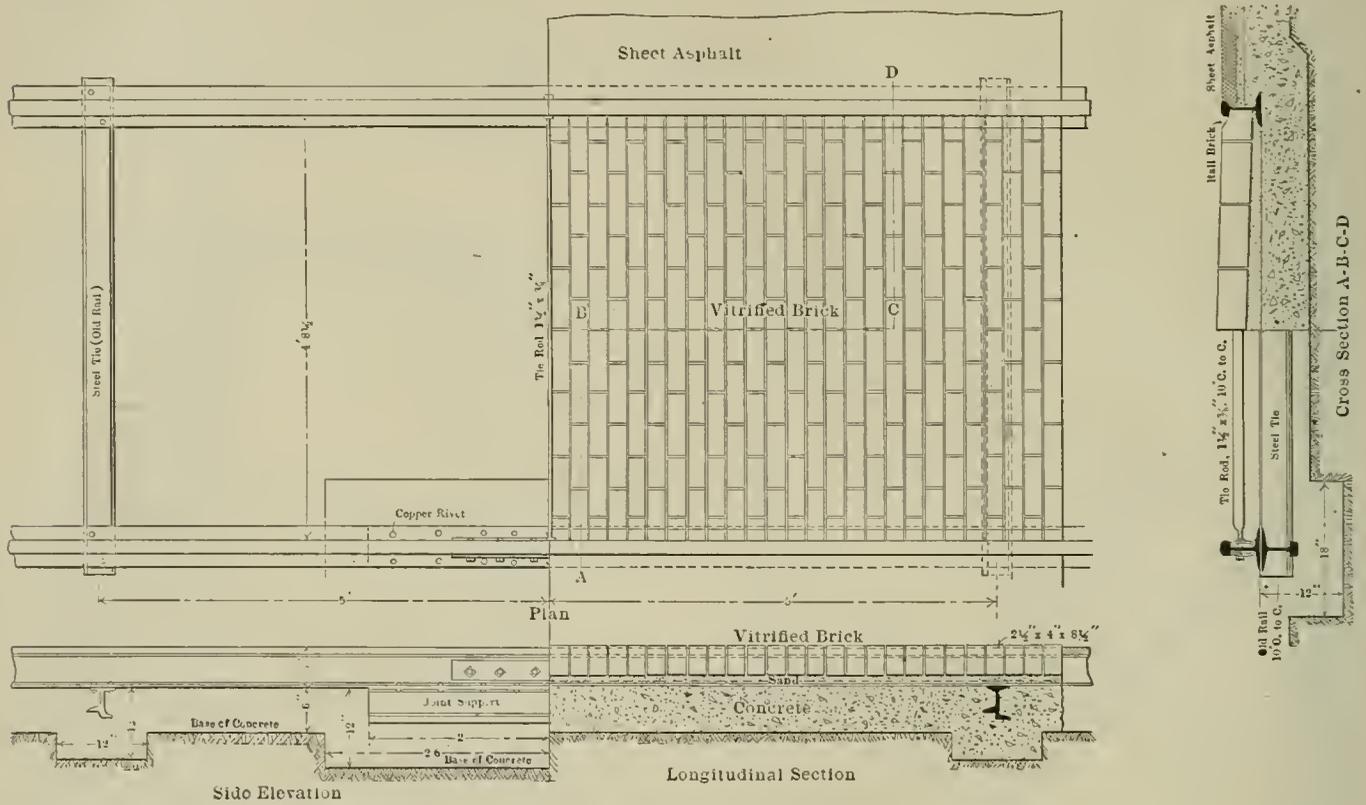

Standard Rail Sections—Section of Standard Six-Inch and Seven-Inch T-Rail Construction, Cincinnati Traction Company.

Chicago on Archer avenue, about a mile of double track. One track was laid with the Trilby-rail section and the other was laid with a T-rail. He believed at the time he examined the track it was about one and a half years old. The portion of the track that had been built with T-rail had the paving stone worn down next the gauge-line of the rail, and it was not worn down evenly, but in ruts, and in his opinion that paving would have to be reconstructed very shortly. That was his objection to the T-rail construction, especially in cities that have a large amount of team travel, heavy drays, etc.

In Buffalo there was an illustration of that same kind. On North Main street, above Cold Spring, the paving stone was the best there was in these parts—Medina sandstone. The paving was worn down to the lip of the rail. It did not wear any further, because the lip of the rail caught it at that point. Down in South Park avenue, where they did not lay a new rail and the old rail was considerably worn, he said the paving stone next the gauge line was all worn out, he-

in the two streets in Buffalo was heavy, the rail sections comparatively light. The sandstone was soft stone. The use of granite, he said, did away with a great deal of the wear on an ordinary city street. He thought Mr. Reel right in saying that T-rail was best for the average street in the average city. Properly laid, it was cheaper for the railway, because it offered less obstruction to ordinary vehicles and was less unsightly. Improperly laid, it was worse than any section of girder rail ever laid.

Mr. F. A. Bagg followed up what Mr. Danforth said by stating that in Johnstown, Gloversville and Amsterdam he used the T-rail. The first section laid was 6 inches and later some 8-inch and also some 7-inch rail was laid. The pavement was brick, asphalt block and bitulithic pavement, with Medina standstone laid inside and outside the rail. These were cities of 15,000 to 25,000 inhabitants, and the team traffic was not heavy. This form of construction was satisfactory. There was not much wear along the head of the

Standard Rail Sections—T-Rail Construction for Paved Streets in Scranton, Pa.

cause the lip of the rail was not sufficiently heavy to protect it. Not only that, but the lip of the rail itself was worn down. He thought that was the idea that all the large cities had in mind in designing and designing heavy girder sections. In the case of the 11-pound rail which is used in Philadelphia, for the last six years they have been gradually getting the rail heavier in the lip, to take care of the team travel. In the new section designed for Chicago, practically the same section as is used in Philadelphia, except that it weighs 129 pounds to the yard, the groove is not quite so heavy. It seemed to him that the fatal objection in large cities, at least in the congested portions of large cities, was the wearing of the paving.

Mr. R. E. Danforth (Rochester Railway) thought Mr. Wilson had covered the large city end of the argument in very good shape. The roads in the Middle West found that the T-rail laid in stone-paved streets was satisfactory, except the streets where there was very heavy vehicle travel, and they preferred it even there to the use of girder rails improperly designed to carry the load. The traffic mentioned

rail, inside nor outside. They formerly used a special brick for the flange-way inside. This was unsatisfactory; the corner of the brick broke off and crumbled. It might have been due to poor brick. Lately the ordinary brick was used, starting the brick under the head of the rail, and curving it up and over to the under side of the head of the other rail.

Mr. Clark said he had the same ideas as Mr. Wilson, until he visited Milwaukee, St. Paul and Minneapolis. Their standard construction is high T-rail. Milwaukee used a 90-pound T-rail with 3-inch head. He had failed to see any of the difficulties that Mr. Wilson spoke of. He said that in Minneapolis they used sandstone block, which they got in the west, and they chipped this block off to make the groove. They did not have a standard brick for putting under the rail. They chipped it off and had no trouble at all with the pavement, although he thought they would have that trouble in Cleveland. In Minneapolis they had taught the drivers of vehicles to keep out of the car tracks.

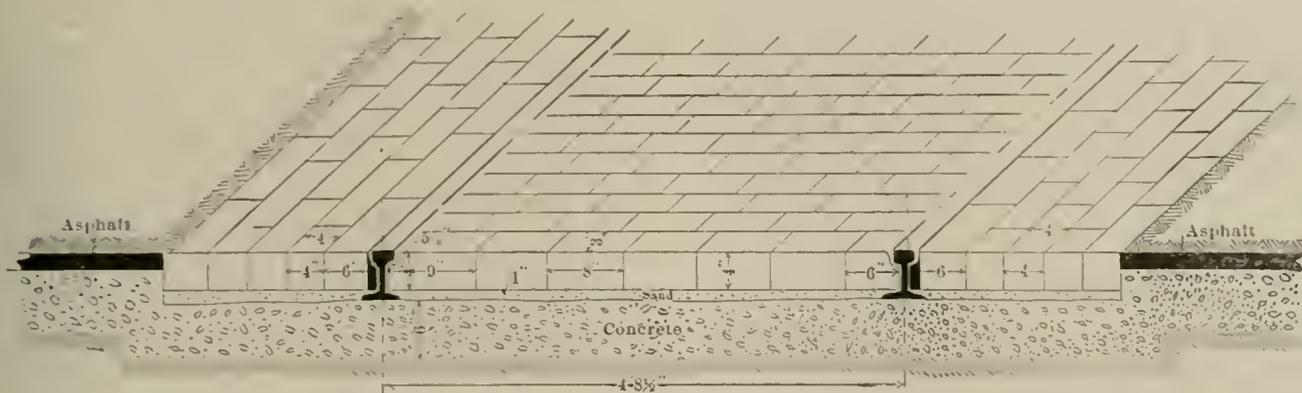

Mr. Reel, in connection with Mr. Bagg's remark, read a letter from Mr. F. E. Crane, city engineer of Amsterdam, to

show what he had to say about these roads. Amsterdam had the oldest piece of T-rail construction in the state of New York; it had been in seven years.

Mr. Bagg said that in Gloversville there was some that had been in ten years.

Mr. W. R. W. Griffin (Rochester & Eastern) related that

secured for putting double tracks in the street, whereas the T-rail was in such condition that it would last four or five years to come. This work was paved in with good old fashioned cobble pavement. Of course, this was a type of paving that heavy teams would naturally keep away from, so that perhaps the team argument would not apply in this case.

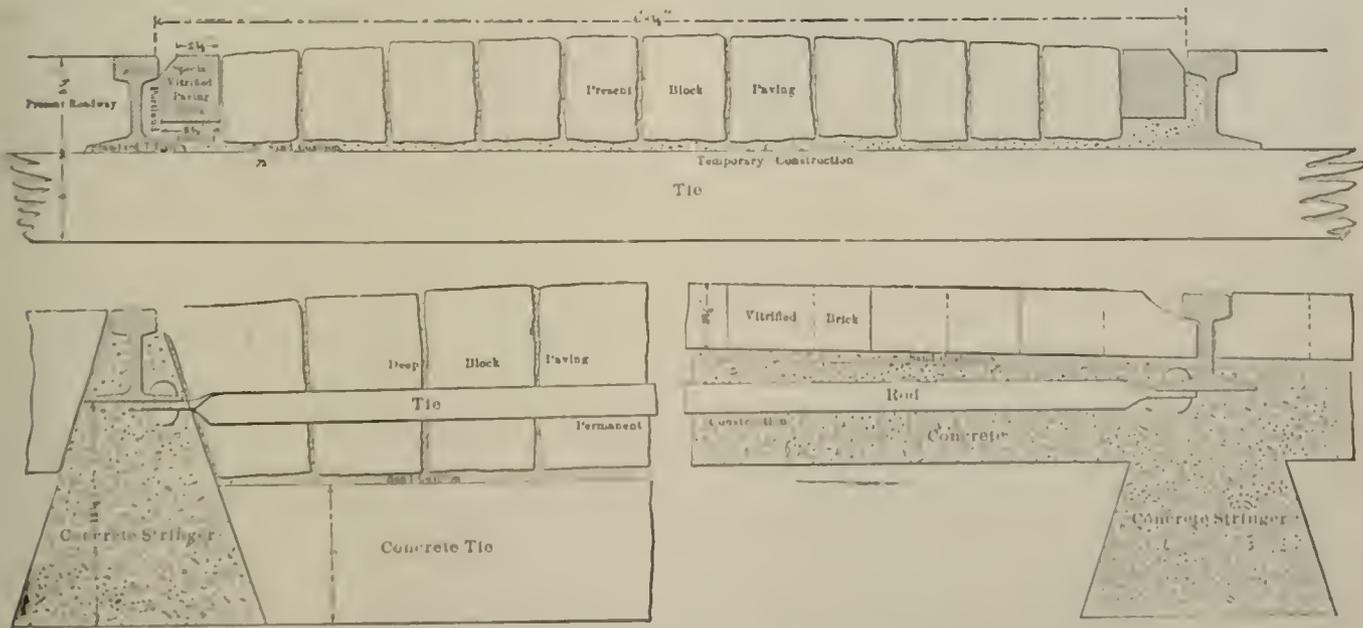

Standard Rail Sections—Section Showing T-Rail and Scoria Block Construction in Montreal.

In 1901, in Bellevue, O., a town of 5,000 inhabitants, they laid the 70-pound T-rail, and the pavement was put in at that time. There was no concrete used, nothing but a sub-grade, and a buffer of sand rolled down. They used nose brick that went underneath the rail. Last summer he examined it and could not see where the pavement had rutted—could not see but that the brick anywhere near the rail was in as good shape as any other part of the street. The town did not have any extraordinary heavy teaming; but the pavement was light because of that fact.

Mr. M. J. French stated that there was some 70-pound T-rail in Utica that was laid in 1894, and previously, and also

Last year there was laid on a portion of Genessee street about 1,800 feet of double-track T-rail construction, using a 7-inch T-rail weighing 95 pounds to the yard, and the Arthur hump block, made by the Metropolitan Brick Company. This rail had a 3-inch head. It was laid with the permission of the city engineer, and with the idea of making an argument to the city to allow the use of the high type of T-rail in all city work in the future.

Mr. Stuart Wilder (Peekskill Light & Railroad Co.) stated that in Peekskill there was some 7-inch high T-rail, the Johnson section and the Trilby section. There were some very good hills there, and it was found that the cars could be

Standard Rail Sections—Track Construction with 90-Pound A. S. C. E. Rail, Kingston, N. Y., and Present Paving Block, with 10 1/2-Inch Paving Block and with Vitrified Brick.

on the same street there was the Pennsylvania section 201-6 9-inch train-head rail, weighing 90 pounds to the yard, and these had been subjected to exactly the same conditions of traffic. The cars on this street were the heaviest traffic cars, weighing 28 tons, and had been operating for four or five years. The glider rail was absolutely worthless, in such a bad condition that it should have been taken out two years ago, and would have been if a franchise could have been

held much better on the T-rail and on the Johnson rail than on the Trilby rail.

Mr. Joseph D. Evans (J. G. White & Co.), from personal observation of conditions in places where he had constructed tracks, preferred a 7-inch T-rail. In many small towns it was insisted upon that the glider rail should be laid, for the reason, apparently, that some other town had a glider rail. In many of these cases he had gone to the city authorities

and got them to change over to a T-rail. To make a T-rail satisfactory, he said, the paving that goes against it should be of the very best material and construction possible.

Mr. Reel asked Mr. Evans why he preferred a 7-inch high T-rail to a 5½-inch or a 6-inch heavy standard section?

Mr. Evans replied that he liked to get the paving where it would not be interfered with by the ties. It could be laid better and cheaper, and he thought it was a better job.

Mr. Brown said he had been advocating using a 5½-inch, 90-pound T-rail, and using a beveled brick so as to bring it under the head of the rail. He found from experience with the beveled brick that there seemed to be less wear than with the compressed curved brick, and the vehicles were enabled to turn out of the track much easier.

Mr. C. H. Clark questioned in running city cars with 2¼-inch tread, and every half hour a half dozen lines of suburban cars on the same route with 3-inch tread, whether the wide head rail was the proper thing, or should the rail have a sloping back?

Mr. T. W. Wilson said he was just considering the advisability of changing the standard rail. Up to this year he had used a 94-pound grooved girder, Lorain section, 94-313. That is the rail section in Buffalo. The head is 2¼ inches, and he thought it too narrow to take care of interurban cars, and also to take care of any prospective tread that might be figured on using in the future. A new section, just designed for use in Chicago in the reconstruction, weighs 129 pounds per yard. It has a 3¼-inch head, the last ¾ inch of which is beveled. Then there was a new section of rail which had been designed for San Francisco, as they were going to reconstruct all the lines in San Francisco. That rail appealed to him very much, with one exception; the lip seemed to be too light for team travel. He had drawn in on the rail a standard 7/8 inch interurban flange, and also a standard M. C. B. wheel and they were accommodated very nicely. He thought the base of the rail, instead of being 6½ inches, could be made 6 inches and the extra metal taken from the base could be put in the lip. He was just having a design made for that. The lip seemed to be too light. He showed a diagram of the standard rail used in Philadelphia and also of one adopted in Albany for all reconstruction. It was supposed to accommodate an M. C. B. wheel, but when he applied a template of the M. C. B. wheel to the rail, it showed that when the tread of the wheel was riding on the head of the rail the flange was riding on the lip. It weighed 141 pounds to the yard, and he did not see why they would introduce such a heavy rail unless they were figuring on carrying freight in the future. He said it was a grave question as to what section of rail should be adopted as a standard. In nearly all cities it was necessary to cut out the T-rail, as it was against the city ordinance.

Mr. Wilson thought he had been misunderstood in some of his remarks. He said he was not against the T-rail, but believed in it for certain sections and cities. He used it in Lockport, 100-pound rail, but there was no team travel. The same construction would be out of place in Main street, Buffalo, or Niagara street, and probably in streets of Cleveland, Philadelphia and New York City. It seemed to him very largely a question of the locality in which the rail was to be laid.

Mr. Bagg asked if that was solid concrete construction with 100-pound T-rail.

Mr. Wilson replied in the affirmative and said wooden ties were put in that street, with 3-foot centers, with 6 inches of concrete between the ties and under the ties. Mr. Bagg asked if he had any objection to steel ties, to which Mr. Wilson replied that when that track was laid steel-tie construction had not been altogether satisfactory, and had been but very little used. As to the paving, he thought Mr. Reel was entirely right about paving brick. To have a good job

it must go in against the web of the rail. Instead of having a corner on the brick, he would have a slant.

Mr. Reel admitted there was a chance for an argument between standard sections and high T-sections, and while he believed that standard sections in a few years would be used exclusively on street railroads, as on steam railroads, he could see there was a chance for an argument on the paving feature. When it came to the question of T-rail against girder rail, from the fact that the T-rails had been adopted exclusively in big cities like Denver, Milwaukee, St. Paul, Minneapolis, Montreal, Indianapolis and dozens more, he did not see, if the rail was properly paved against with a granite block, as in St. Paul and Minneapolis, why the rail would not give satisfactory results in a city like Buffalo. The difference between Minneapolis, Milwaukee, St. Paul and Indianapolis was not very great. Where they get such satisfactory results from the construction indicated, Buffalo with the same construction should also give satisfactory results. Any manager who would use a girder section willingly, unless he was sure that the T-rail would positively not answer, in his opinion, was not not doing the best he could for the public and for his company. Girder joints could not be made to hold, and because of the necessity for tearing up the streets, the public lost along with the company in the fact that the street could not be restored to its original condition. The life of the T-rail is the principal argument in its favor.

Mr. E. P. Roundey (Syracuse Rapid Transit) asked Mr. Reel if he could hold the joints of a T-rail better than the joints of a girder rail. He said steam roads could not hold their joints together any better than street railways. Mr. Reel thought steam railroad joints were not battered down like street railroad joints. The heavy rails in New York were distorted at the joints, battered down, and could not be restored. They did not batter down on the tracks of the New York Central Railroad two or three inches, as the girder rail did.

Mr. Wilson answered Mr. Danforth's remarks about Medina sandstone pavement, saying it was a great question which wears longer, sandstone pavement or granite. The track in Chicago which he examined was granite paving, and showed considerable wear. The city engineer of Buffalo and a number of his assistant engineers believed that on account of the brittleness of granite, sandstone would wear longer. There were streets in Buffalo which had been down for thirty years in sandstone pavement and they were in good condition.

Proposed Electrification of Baden State Railways.

According to a notice in the German technical press, tests are being made on a large scale with a view to electrifying the Baden state railways. Current is to be supplied from a power station under construction at Wyhlen-Augst, where a turbine with an output of 1,500 horsepower is to be rented. It is calculated that an aggregate of 2,400,000 kilowatt-hours will be required to supply the energy necessary for the electric operation. Three schemes have been suggested. That of the Siemens-Schuckert Works provides continuous current operation at 3,000 volts, with 40-ton, four-axle locomotives driven by 150-hp. motors at two main speeds. The scheme of the Allgemeine Elektrizitäts-Gesellschaft provides single-phase current with three-axle locomotives at only one main speed. The former company estimates the cost of installation at 2,720,000 marks (about \$680,000) and the working expenses at 331,087 marks (about \$83,000), while the corresponding figures given by the Allgemeine Elektrizitäts-Gesellschaft are 2,281,000 and 349,700 marks (about \$570,000 and \$87,000) respectively. It may be said that the present cost of steam operation is 363,522 marks (over \$90,000). It is expected that electric service will commence at the end of 1909.—Scientific American.

CAR HOUSE AND SHOP EMPLOYES.*

BY A. D. M'WHORTER, MASTER MECHANIC, MEMPHIS STREET RAILWAY

An economical and efficient force for car barn and shop work should be thoroughly systematized in every respect, and separated into departments that are also systematized in every detail of their work.

The Night Foreman.

The most important department for the good of the operation of a street railway company is the night force, when the inspection is done at night; and this is the case with most street railway properties. The night force should be under the supervision of a thoroughly competent and broad minded man. To be a competent night foreman a man should be educated for this position by practical experience while taking care of each class of work that is done at night. With this experience he will be able to judge the amount of work that should be done by each man under him.

To get the best results the night foreman should rate the positions in the shop according to their importance, and he should instill into each man the importance of the position he holds and the responsibility that rests on him. Also that it is in his power, to an extent, to make the operation of the road a success. This thought should be carried down the line from the best position to the one of the least importance. Any shortcomings of the workmen should be brought to their attention at once. The night foreman should get a report each night of the trouble that has shown up during the day on the cars for which he is responsible. Each man should know that he is performing the part for which he is held responsible, and that upon the efficiency of his work depends the successful operation of that part.

Breaking-in New Men.

In employing new men for shop work they should be thoroughly instructed as to what they are to do. It should be explained to them that they will have to start at the bottom, in case they are inexperienced, and that they will gradually be promoted to better positions and better pay as they become familiar with the work and that the rate of promotion will be governed by their interest and good work.

If a foreman adopts this system and puts all of his new men through the different classes of work that are done at night, he will gradually be surrounded by a class of men who are termed as "all around" street car men. This will enable the foreman to be more independent than if he should keep one man on one job indefinitely. The writer has known of cases of this kind, where a shop was operated by a, so-called, good lot of men, but there were no two men in the shop who could exchange places and give any degree of satisfaction until each had become familiar with the work of the other. This, as can be readily seen, places the foreman in an embarrassing position if he should lack a man, or a number of men, and be obliged to arrange the force to suit the conditions. The particular job to be filled would not receive the proper attention in the absence of the regular man, even if it were possible to fill the vacancy.

To the writer's mind the best results can be obtained by classifying the men and encouraging them to take all the interest possible in the work and letting them know that they will be promoted to better positions and better pay. With these conditions the most reliable men can be selected for promotion. If the men are thoroughly familiar with all classes of work, and have had practical experience in each department, they may be of invaluable service to a new employe as well as to the foreman and company.

In the writer's mind it is more necessary to have a good, competent, night foreman than a good, competent, day foreman, if both are not to be had, as it is possible for the master mechanic to keep in closer touch with the operation of the day force.

Handling Inspection and Repairs.

To get the best results all operating cars should be put over the pits and thoroughly inspected every night (or day in case of all night cars). The pit inspectors should each have certain pits to work in and certain cars to inspect, and the same cars each night. They can be held responsible for their work in this manner and it makes it possible to tell which man is not keeping his work up to the standard. Where the pit room is limited it is impracticable to hold the cars over the pit for any considerable length of time, when the cars are coming in off their runs. In case more work is required than can quickly be disposed of it is best to shift such cars to storage track and put them over the pits for

such work as is necessary after the rush is over, or it may be necessary to hold the work for the day force.

The writer has under his supervision the care of 45 double-truck quadruple equipments and 109 double equipments handled and inspected in the above manner in one car barn, having eight pits 200 feet long. The inspecting and cleaning are done by 33 men.

The average number of cars in the shop for repairs during the day does not exceed 5 per cent of the operating equipment. It may be added that a record of the inspection of each part of each car is made by the several inspectors and filed in the master mechanic's office.

The method of educating and handling night men holds good for the day force in the same manner as it does for the night men. The day force should be divided into departments, according to the number of cars operated. The machine shop and car barn forces also should be divided into departments, having a competent, economical and broad minded foreman for each department who should report to the general foreman.

There should be foremen for the carpenter shop and paint shop who should report directly to the master mechanic. The number and class of men in these departments should be governed by the class and amount of work that is being done.

This system in a car shop, together with a wide-awake foreman in each department and a master mechanic who never ceases trying to bring his men up to a higher standard will produce excellent results, but it cannot be what it should if the master mechanic spends only his office hours with his men.

COPPER-WELDED RAIL BONDS.

Two methods that present interesting solutions of the bonding problem have recently been perfected by the Electric Railway Improvement Company of Cleveland, O. These methods, known as the "welding" process and the "brazing" process, employ the usual types of ribbon bonds and vary only in the method by which they are attached to the rail.

Copper-Welded Rail Bonds—Joint with Two No. 0000 Electrically-Brazed Bonds.

By either process the copper of the bond is closely united with the steel of the rail and the bond itself may be placed on the ball of the rail, the web or the base.

Electric Welding.

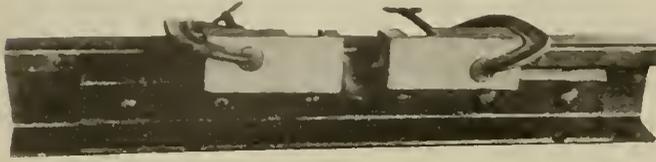

The electric welding or brazing of the bonds is done by the Thompson method. All rights for employing these methods in connection with the bonding of track work have been leased by the Electric Railway Improvement Company.

The accompanying illustration shows one of the cars equipped for doing both classes of bonding work. Power for the operation of the car and its apparatus is taken from the trolley wire and fed to a 15 kw. rotary converter mounted on the car floor. This converts the 500-volt direct current into alternating current suitable for use with an electric welding transformer. This transformer is also shown mounted on the rear end of the car. It takes the current for its primary side from the slipring side of the rotary converter and its secondaries deliver current to the points of contact for welding at from five to seven volts and up to 2,000 amperes. The current is led from the secondary terminals of the transformer by two heavy cables connecting with bonding clamps which have special carbon contact points. The contact points are mechanically joined so that when a bond is to be brazed to the rail it is held firmly in place while the temperature is

*Read before the Newnan Properties Association.

being raised by the flow of heavy current. After clamping the bond, either on the head or the web of the rail, the current is fed to the transformer and being regulated by resistance in series with the primary a proper degree of heat is obtained to raise the temperature of the copper bond and the brass cap with which it is provided to such a point that the copper ribbons will unite with the steel of the rail, as in the more usual forms of brazing.

It has been found that bonds placed in this way are so

Copper-Welded Rail Bonds—Clay Molds in Position for Cast Welding.

firmly attached to the rail that it is impossible to remove them except by laborious chipping and then one must mutilate the rail or the bond before they will separate.

It is interesting to note the records of low cost that have been made in Cleveland under varying conditions of weather, labor and schedule of cars on tracks being bonded.

With the Railway Employees.

Car No. 1 operated by employees of the Cleveland Electric Railway on December 17, 1906, between 12:30 p. m. and 3:30 p. m. in freezing weather with regular 2½-minute service operated over the track bonded, completed placing 28 No. 0000 bonds (14 joints) which were electrically brazed to the ball of the rail. The street in which this track is laid is paved with block-stone. The bonding gang comprised three men who opened and closed the pavement and cleaned the rail ready for the bonds and three men who operated the bonding car. It was necessary to remove the bonding car from the track 14 times during the three hours required for placing the 28 bonds. The actual cost of labor for placing these bonds was reported as \$3.30.

On another occasion the same car, with a night crew of the same number and with regular cars passing on half-hour schedule, placed on 29 joints, 58 No. 0000 bonds, applied as in the other case, at an actual cost for labor of \$5.50. This work was done in freezing weather December 18, 1906, from midnight to 5 a. m.

With Improvement Company Employees.

In the summer of 1906 a night crew of the Electric Railway Improvement Company comprising four men and work-

Copper-Welded Rail Bonds—Clay Mold Removed Showing Extra Copper Ready for Trimming.

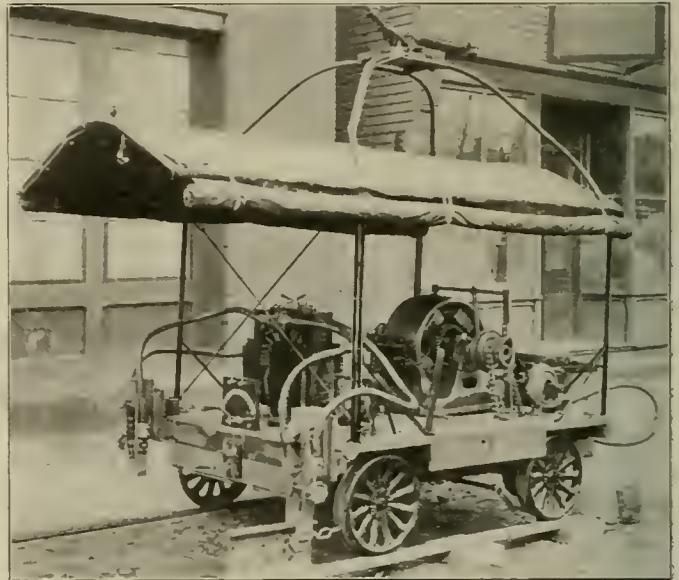

ing from 7 p. m. to midnight while cars passed on five-minute intervals and from midnight to 5 a. m. while cars passed on one-hour intervals, electrically brazed to the ball of the rail in block-stone pavement 105 No. 0000 bonds in the same number of joints. In doing this work it was necessary to remove the bonding car from the track 50 times. The cost for labor, however, was only \$8.00 for opening, bonding and completing the pavement at 105 joints.

Copper Welded Rail Bonds.

The second bonding process perfected by this company

consists of joining to the rail the usual types of ribbon bonds, by means of cast welding. The outfit necessary for carrying on this work comprises a car much the same as that shown in the illustration except that in place of the rotary converter there is a Marine type gas engine. This offers the advantage that it makes the outfit available for use on roads under process of construction and not yet provided with a working trolley. As in the case of the electric welding outfit the engine is geared to the axles of the car through a chain and friction clutch so that the unit is self-propelled. Such cars have six coke furnaces, each capable of melting one crucible of copper. Blast for the furnaces is furnished by a blower-fan driven by the gas engine.

When bonding the rail is first ground smooth and bright at the points of application of the bond terminals. Graphite molds which hold the bond as shown in one of the accompanying illustrations, next are clamped to the rail. These molds have their inner aperture recessed to such shape that a much larger amount of white-hot copper can be poured into them than is necessary to cast-weld the ribbons of the bond to the steel of the rail. In this way with the large mass

Copper-Welded Rail Bonds—Self-Propelled Car Equipped for Copper Cast Welding and Brazing.

of metal the temperatures can be better ganged. After the molds have been removed the extra copper which does not come in contact with the steel is chiseled off, leaving the terminal strands of the bonds welded to the rail.

The cost of welding with this process is said to vary not greatly from that of the brazing method as earlier described. It has the apparent advantages that the bonding work may be carried on before the overhead construction is in working order and that the work is flexible and may be applied for connecting feeder cables, cross-bonds and third-rail terminal bonds, as well as bonding running rail and third-rail joints.

An interesting feature in the construction of the cars used for this work is the inverted jack placed under the center of the car floor and having for its bearing surface a round steel plate. This jack may be raised and lowered by means of cranks extending under the car floor and outside of the track. When it is desired to remove the car from the rails these cranks are turned in the proper direction until the jack resting on the plate has raised the entire car so that the wheels are free from the track rails. Then the car can be swung to a position at right angles with the track and either rolled off on to the pavement in cities or on temporary wooden strips when on private right of way.

ANNUAL MEETING, CENTRAL ELECTRIC RAILWAY ASSOCIATION.

The first annual meeting of the Central Electric Railway Association was held at the Claypool Hotel, Indianapolis, Ind., on January 24. This gathering, which marked the end of the first year since the consolidation of the Ohio Interurban Railway and the Indiana Electric Railway associations, was a successful one. The programme for the day included a business meeting, several interesting papers, annual election of officers and the annual dinner.

The association was called to order at 11 a. m. by President E. C. Spring. After the routine business had been completed G. H. Kelsay, superintendent of power, Indiana Union Traction Company, presented a paper on "The Cost of Power for Rental Purposes. Developing a Demand for Renting Power. Does it Pay?" Mr. Kelsay's paper will be found on another page of this issue.

At the close of the paper the author stated in reply to a question that the figures presented in his argument had been taken from actual problems on operating roads, but that it should be noted that in each instance the percentages of interest and depreciation had arbitrarily been given him.

T. C. McReynolds (Kokomo Marion & Western) stated that his company is now supplying current for lighting purposes to the towns of Swazy and Greentown. The transmission line carries 60-cycle current at 10,000 volts potential. At Greentown, current at this potential is stepped down for lighting use to 208 volts by a transformer mounted on a line pole. This method of supporting the transformer, however, is not to be recommended. At Swazy the company has a rotary-converter substation in which is a transformer of the type mentioned, supplying current for 16 arc lights and a commercial circuit. The arc lamps are furnished under a 5-year contract. The speaker did not consider this business very profitable. He suggested that in estimating the costs of current for rental purposes there should be added the item of retolling expense, maintenance of secondary distribution lines, also the cost and maintenance of the lamps and their accessories. While his experience has been limited it was expected that within a year a good load might be built up.

Adjournment for luncheon.

Afternoon Session.

The first paper of the afternoon session was that by Ellis C. Carpenter, claim agent, Indiana Union Traction Company, entitled "The Handling of Accidents and Claims." This paper appears elsewhere in this issue.

In reply to questions Mr. Carpenter said that the percentage of gross receipts paid in the settlement of claims by the Indiana Union Traction Company for the past year was slightly more than 2 per cent. This included settlements for

the more common forms of accidents, personal injury, property loss, lost baggage, attorneys' fees, surgeons' fees, retainers for company doctors, but not the loss to the company from damage to rolling stock or other property.

President Spring announced that the proceedings and papers of the meeting would in the near future be printed in pamphlet form and distributed to the members.

W. H. Evans, master mechanic, Indianapolis Traction & Terminal Company, next read a paper on "The Model Car for Long Travel." He exhibited blueprints showing sections and floor plans of types of cars suitable for interurban service. The paper appears elsewhere in this issue.

The author in reply to a question by Mr. Henry stated that a car 60 feet long is generally required on lines operating hourly schedules. Such a length is also required to provide for the baggage compartment. He saw a disadvantage in having doors on one side only and, in fact, recalled some cars (thus built which had had a second door cut in the baggage compartment. Some day the lines may be so double-tracked that single-sided cars can be operated.

Arthur W. Brady (Indiana Union Traction) inquired as to a suitable method of ventilating cars. This, Mr. Evans said, was an important point that had been overlooked in the paper. As yet dependence must be placed on a deck-sash, but auxiliary ventilation should be used. He favored the ejector type, as it created much less draft. He stated that the Indianapolis & Northwestern car, as exhibited at Columbus, weighed 75,000 pounds.

Cale Gough (Street Railway Journal) described the new ventilator system being installed by the Chicago City Railway. Such ventilators consisted of deflectors 18 inches by 12 inches placed in the front of the deck and slanted to force the air to the ceiling. Their capacity was 40 cubic feet per second which kept the air in a car carrying 100 people as pure as that of the ordinary

schoolroom. R. C. Taylor (Indiana Union Traction) suggested that the deadweight of a car per passenger should be less. On his request a motion was passed that a committee of four be appointed by the chair to report as to plans for a lighter standard car.

R. C. Taylor, superintendent of motive power, Indiana Union Traction Company, next read a paper entitled "Car Lighting," which will be found elsewhere in this issue. In the discussion of this paper the author stated that the novel method proposed for maintaining an even voltage on the car lamps would cost less than \$100 per car, and that a saving of \$100 per car per year would be gained.

Secretary Millbolland then read four applications for membership, which were noted upon favorably. Chairman Wilson of the nominating committee, reported the following list of names as nominations for officers for the year 1907, and a unanimous ballot was cast for them.

H. A. Nicholl, President-elect.

President, H. A. Nicholl, general manager Indiana Union Traction Company.

First vice-president, Frank D. Carpenter, general manager Western Ohio Railway Company.

Second vice-president, R. I. Todd, vice-president and general manager Indianapolis Traction & Terminal Company.

F. D. Norvell, general freight and passenger agent Indiana Syndicate Lines.

A. A. Anderson, general manager Indianapolis Columbus & Southern Traction Company.

Charles Murdock, vice-president Ft. Wayne & Wabash Valley Traction Company.

Interurban Rolling Stock Exhibited at Indianapolis Meeting.

Treasurer, W. F. Millholland, treasurer Indianapolis Traction & Terminal Company.

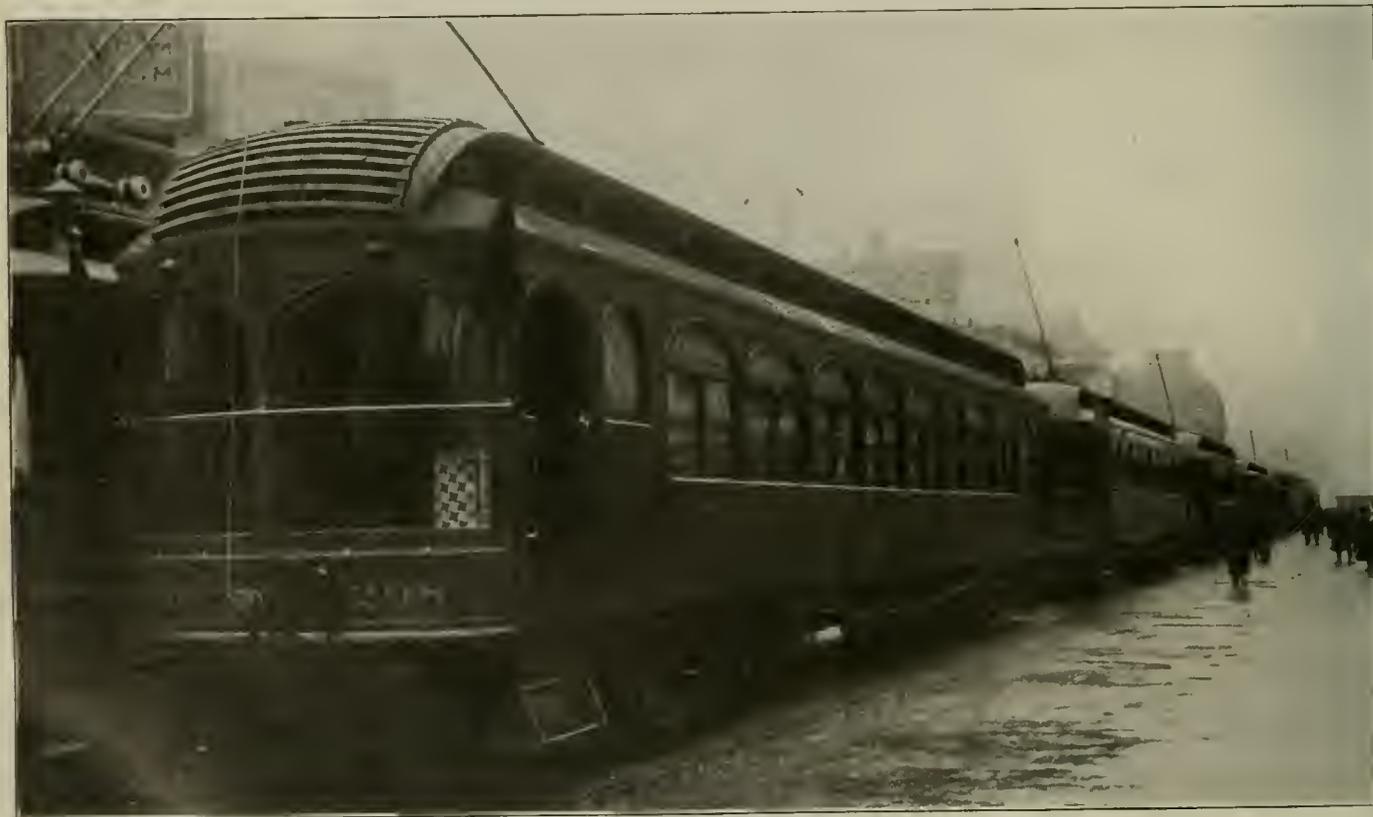

Executive Board.

Harrie P. Clegg, president Dayton & Troy Electric Railway Company.

F. J. J. Sloat, general manager Cincinnati Northern Traction Company.

C. D. Emmons, general manager Ft. Wayne & Wabash Valley Traction Company.

C. C. Reynolds, general manager Indianapolis & Northwestern Railway Company, Indianapolis & Eastern Railway Company, Richmond Street & Interurban Railway Company, Indianapolis & Martinsville Rapid Transit Company, Indianapolis Coal Traction Company, Indianapolis & Western Railway Company.

Interurban Rolling Stock Exhibited at Indianapolis Meeting.

L. C. Bradley, general superintendent Scioto Valley Traction Company.

E. C. Spring, general superintendent Dayton Covington & Piqua Traction Company.

C. N. Wilcoxon, general manager Cleveland & Southwestern Traction Company.

President Spring read a letter of regret from President-elect Nicholl, who was unable to attend the meeting on account of illness.

Several members of the association, including Charles

L. Henry, E. C. Carpenter and Arthur W. Brady, next discussed the advisability of broadening the field for interurban express. It was stated that several old-line express companies were desirous of entering into contracts with interurban rail-

Annual Dinner.

About 175 members and guests attended the annual dinner held at the Claypool Hotel. The association was welcomed by Mayor Bookwaller, of Indianapolis, who, in the

ways. The Central Passenger Association has decided to countermand its rule regarding the exchange of tickets so that from now on electric interurban and steam roads may be more closely associated in handling passengers.

Then followed a discussion of the advantages and disadvantages of forming a mutual express company, which would

course of his interesting speech, felicitated the interurban managers on the rapid progress that had been made in their field.

President Spring then presented his annual address.

President's Annual Address.

President Spring in his address first reviewed the rea-

operate over the interurban lines and solicit an exchange of business with the present companies operating on steam lines. It was voted that a committee of three be appointed to study this question more thoroughly

sons for the organization of the two state associations, that of Ohio and that of Indiana, and the considerations that led to the consolidation which was effected a year ago. In commenting on the work of the past year Mr. Spring said

The establishment of the permanent secretary's headquarters with a permanent secretary was an innovation among similar associations, but the experiment has proved itself one worthy of our efforts. It is almost impossible adequately to state the exact accomplishments which the permanent secretary's office has accomplished during the year, as the work required has been of such a nature, that not only one interest has been served, but many. The office has been the headquarters not only of railway officials, but of the supply men when in Indiana. The office has been a complete bureau of information, not only for members of our association, but for interests outside. The loyalty, interest and enthusiasm regarding the secretary's office are shown by responses to letters sent out from the secretary's office on December 1, 1906. Thirty-five circular letters, requesting information as to the manner of heating interurban cars were mailed. Twenty-nine responses have been received and, on the bottom of one of these responses was a notation made by the manager of the road, which read: "Give me this information quick and forward to the head of this particular department for the information desired." Another demonstration, made recently, was a request upon the companies, members of the Interchangeable Coupon agreement, for information regarding the issuing of a new bulletin. Every road responded readily. Requests have come from the various adjoining states and from Canada for information on different subjects, which have been discussed at our meeting. During the last year, upwards of 6,500 letters, answers to inquiries, etc., have been sent out from the office, also over 8,000 legislative circulars. The giving of information of various character, the sending of circular letters for different companies, the asking for information upon various subjects, and the answering of inquiries from all over United States and Canada, are some of the few matters that have been handled by the secretary's office.

The office has brought about a great fraternal feeling between the companies, which could not have been done through any other medium. The tabulating of the interchangeable coupon tickets has been of great interest to the various companies; the tabulation shows an average of \$7,500 a month collected through the interchangeable coupons.

The recognition which our association received during the annual meeting of the national association was very marked. Our secretary at that time was enabled to give great assistance to the secretary of the national association. I might go on and name many other instances, which would tend to prove the benefits derived from the permanent secretary's office, but time will not permit.

At the last of the year our secretary was attracted to other fields of work and resigned his position. The rest of the year, the office has been under the charge of Mr. Milholland, our treasurer, and, I take the opportunity at this time to publicly thank and compliment Mr. Merrill, our past secretary, for the work which he did in instituting this new office. I also wish to publicly thank and compliment Mr. Milholland upon the magnificent support which he has given the association and for his untiring energy in looking after its affairs. The members of the executive board I wish at this time to thank for their personal interest in the affairs of the association and for their help and their counsel in administering its affairs during the past year.

We have reason to congratulate ourselves and feel proud of the record made by this association. The association stands today pre-eminent, head and shoulders above any other organization, outside of the national association. Its acts and its works are being watched closely and copied by various associations. Other states are being stimulated into activity by the work of our association, realizing that in an association of this kind, a closer relationship can be had between the various properties. With the consolidation of interurban roads into great systems, as has been done during the past year, making it possible to ride in electric cars for distances of three and four hundred miles, has been brought about a large development of through passenger traffic over these interurban lines, which has made the daily operation doubly remunerative. Doubly remunerative because the present local traffic is already highly profitable, and because this additional through traffic, while swelling the gross earnings, will add but little to the cost of operation. The interchanging of one line with another, both in passenger and freight traffic, has been more successfully carried out, and the obstacles met with more pleasantly adjusted, through the working of our association, and I consider that this has been the grandest work as well as the most beneficial that the association has done.

In concluding Mr. Spring congratulated the association upon the selection of officers for the ensuing year and urged

that each member bear in mind the need of enthusiasm in attaining a high ideal.

President Spring next introduced Charles L. Henry, president and general manager, Indianapolis & Cincinnati Traction Company, who acted as toastmaster. During the course of the evening the following gentlemen addressed the association and complimented it highly: Joseph A. McGowan, Indianapolis Traction & Terminal Company, Indianapolis; John F. Ohmer, Ohmer Fare Register Company, Dayton, O.; Charles W. Miller, ex-attorney-general of Indiana; Matthew Slush, Detroit, Mich.; D. J. Evans, Rail-Joint Company, Chicago; A. W. Brady, president, Indiana Union Traction Company, Anderson, Ind.; Colonel W. T. Durbin, ex-governor of the state of Indiana; C. N. Wilcoxon, general manager, Cleveland & Southwestern Traction Company, Kamms, O.; Rear Admiral George Brown, U. S. N., retired, Indianapolis; E. W. Olds, superintendent of rolling stock, The Milwaukee Electric Railway & Light Company, Milwaukee, Wis.; D. M. Parry, Indianapolis, Ind.

Entertainment Features.

Through the courtesy of the Indianapolis & Cincinnati Traction Company a number of attendants at the convention enjoyed a trip to the Rushville power house of this single-phase electric road.

The accompanying illustrations are views of the exhibit of interurban rolling stock equipment that was shown during the day on Kentucky avenue near the headquarters. This was probably the most complete exhibition of the various types of interurban cars and locomotives that has ever been seen in this country.

ELECTRIC RAILWAY UNION STATION FOR HAMILTON, ONT.

A contract has been let by the Hamilton Cataract Power Light & Traction Company, for the erection of a building on the southeast corner of King and Catharine streets, Hamilton, Ont., for a terminal station for electrical railways. The station proper will be 112 feet long by 72 feet deep. The building will be placed 12 feet east of Catharine street, and on this 12-foot strip will be erected a covered shelter leading from King street back to a large theater which is to be built at the rear end of the lot at some future time. This shelter will also serve as an exit for passengers from the trains. The office building will be four stories high, with a basement, and will be erected of Indiana limestone for the first two stories, while buff terra cotta fireclay brick will be used for the upper stories, finished off with terra cotta balusters. The building will be thoroughly fireproof, and will be built of reinforced concrete for columns, beams and floors.

The ground floor will be laid out for station purposes, the ceiling being 20 feet in height, and the floor covered with mosaic and the walls lined up 8 feet high with Italian marble. The accommodation includes a main lobby in the center, entered from the street through large double doors. To the right is a marble staircase to the upper floors and the elevator. The main lobby leads to the ticket wickets, behind which is the vault, etc. On the right is the ladies' waiting-room, and on the left the general waiting-room. In the rear of the general waiting-room is the conductors' room. The second floor will be occupied as offices by the Hamilton Cataract Power Light & Traction Company, and the third and fourth floors are to be divided into offices. The company's stores department will be located in the basement.

The Hamilton Radial Railway, the Hamilton & Dundas Electric Railway, the Brantford & Hamilton Railway, the Hamilton Grimsby & Beamsville Electric Railway, and the Hamilton Guelph & Waterloo Railway, will have their terminals in the building. The architect is C. Mills, Hamilton, and the contractor is the Canadian White Company, Montreal. The contract calls for the completion of the building ready for occupancy by August 1, 1907.—Railway & Marine World.

HANDLING OF ACCIDENTS AND CLAIMS.*

BY E. C. CARPENTER, INDIANA UNION TRACTION COMPANY.

There are about as many ways of handling accidents and claims as there are claim adjusters and general managers; very few operating along the same lines; each working along whatever line he has found practical for his company and the conditions under which it is operating.

The best way to handle accidents is to prevent them, and it is wise—and dollars are saved—to employ the best and most intelligent men to be had in the various departments of the service, thus securing the best results from every standpoint, but, as accidents will happen, we shall treat the subject somewhat as the auctioneer who still had "one more left."

In a general way, accidents should be handled according to the policy of the company. Should there be no policy in these matters, then the adjuster should work along fairly liberal lines and determine what is best for his company, and gradually establish his reputation in the communities with which he comes in contact.

In the handling of accidents, every claim department should have a system of blank reports concerning the various classes and kinds of accidents that will be suited to the peculiar conditions of the individual company. For instance, where a company is operating interurban as well as city lines, the general forms of report should be prepared to cover all such conditions as nearly as possible. Then there is the "trouble-report" blank for troubles occurring on cars, such as ejections, controversy over fares, or assaults by either passengers or trainmen; blanks for securing names and addresses of witnesses; an employe's blank for accidents to employes in shops, substations, machine shops, track construction, etc.; stock reports for stock killed or injured; telephone reports for use of the dispatcher in case of serious or fatal accidents, in securing short and concise information when accident is first reported; delayed-baggage report blanks for agents' used in securing immediate report where baggage is delayed in transit; the usual release blanks covering the various kinds of claims on the part of employes, passengers, other persons, or property, that may be made under the laws of the state in which you are operating; indices for keeping accurate record of accidents, both daily and alphabetically, etc. Thus equipped, the claim department is ready for active work.

The prompt reporting of all accidents, bad, slight, trivial, and those of seemingly no importance, and the securing of accurate information regarding them, is of the utmost importance in the proper handling of those matters; and right here is where the transportation department, as well as the others, should exercise the utmost care, and adopt vigorous measures to see that employes shall make immediate reports of all accidents, and see that such reports are promptly forwarded to the claim department, and proper discipline should be administered for failure to obey; and, further, that information concerning accidents must not be given to any one except the proper officials of the company.

The growing tendency upon the part of injured parties to rush off to attorneys and sue the company for real or imaginary injury, makes it of great importance to have all accidents reported in detail most promptly. This will give the claim department the opportunity for prompt action in such cases, as may be necessary. Usually, it is the blind or unreported cases, or the cases which, in the opinion of the conductor, do not amount to anything, and are too trivial to report or go to the trouble of taking witnesses, that give the most trouble. Fakirs are usually smooth enough to mislead the conductor and have this kind of a story, then afterwards appear with more witnesses than the company, with the result that the case is either compromised or, if tried, a liberal verdict found for the plaintiff, where, had the matter been treated as serious and promptly reported, Mr. Fakir would go a begging.

Another class of claims that deserves attention, and which seems to be growing, and which may be a source of considerable loss, is that of claims for delayed or lost baggage. There will be more or less of this class of claims so long as the present imperfect system of checking is in use. There should be a more perfect system adopted so as to enable each company over whose line baggage is routed to accurately trace each piece delivered to it. The only thing that can be done by the claim department, under existing conditions, is to keep the amounts paid on these matters as low as possible, and this can best be done by using a "delayed-baggage" report, as illustrated. This form is placed with the

agents, and as soon as a person presents a baggage check and it is ascertained that the baggage is lost or delayed, the blank is filled out, giving the name and address of the person holding the check, the firm and address represented, check number, where checked, destination, via what route, and value, including contents; this constituting the first part of the report. Suppose baggage is delayed for two or three days—finally reaching destination—the party holding the check calls for baggage, the agent, who still has the report, fills out a receipt, which is the second part of the report, showing condition in which baggage is delivered, date and hour of delivery, and secures the signature of the owner. This determines accurately the condition and time of delay, and reduces the opportunity for making a claim to the shortest possible length of time, as well as showing, under signature of the owner, the exact condition of baggage. After this is done, the agent fills out the third part of the report which gives the agent's report as

to the cause of the delay, and makes any remarks he may desire upon the condition of baggage, marks the time of forwarding to the claim department, and signs it and sends it in. In this way, all information needed is secured from interested parties under the most favorable circumstances.

Reports of accidents sent to the claim department usually do not give all the information needed, but are merely the starting point or foundation for the investigation which must follow, and this should be done as quickly as circumstances will permit.

We have found, in the investigation of accidents (except in cases of clear liability, such as collision cases where passengers are injured), that a splendid rule to follow is, first secure as full information as possible from the train crew or employe in charge, taking signed statements; then if possible, procure the signed statement of the injured party, showing his version of the matter, thus getting at both sides of the question, and nothing what will be necessary to be covered by

*Read before Central Electric Railway Association, Indianapolis, January 23, 1907.

disinterested evidence when the signed statements of the disinterested witnesses are procured. In this way, you can gather the facts in a tangible manner, so the merits of a claim can be determined with reasonable certainty. A shrewd investigator can inquire regarding the vital matters of an accident and quickly develop all the witness knows, and, in reducing the subject-matter to writing, if he will carefully follow the line of the conversation and use the peculiar expressions and language of the witness as far as possible, omitting immaterial matters, it is seldom indeed that a witness will refuse to sign a statement. Afterward, should the witness testify in court to a state of facts materially different from the statement, he can be confronted with the signed statement and his testimony discredited.

In the investigation of accidents, it is absolutely essential for the investigator to have a sufficient knowledge of the law to know what constitutes negligence, not only of an injured person, but the company as well. He should also have a general knowledge of every department of the service, for the reason that the rules of negligence differ in cases of employes, passengers, or a person who is neither an employe nor passenger. He should be sufficiently competent to so frame his sentences as to state facts clearly and concisely, and avoid the use of statements that are not clear or are misleading. When one has a witness who knows the facts about an accident, put these facts in such a way that there can be no misunderstanding, and such a statement will be doubly strong in refreshing the recollection of a favorable witness, or of contradicting an unfavorable one, in court. These points, we believe, demonstrate the advisability of employing men of sufficient capacity to grasp the situation under investigation.

We have thus indicated a general plan pertaining to the investigation of accidents, but there is one class of accidents—those resulting in death—where a different line of investigation should be followed: In this class of cases, the company's employes should be required to report at the office of the claim department immediately after such accidents, and before information of any kind is given to any person, where full details should be secured by the claim department, after which short affidavits covering the main facts of the accident—free from objection—should be prepared, so that the employes can be taken by the claim adjuster before the coroner and an affidavit sworn to by the employes. As a rule, coroners are satisfied with a general statement of fact, and they should not be misled, but coroners are usually doctors, and they are very likely, if left to their own resources, to ask about minor matters and secure statements from employes that would be embarrassing in court and hard to explain away, as such statements are reduced to writing and sworn to by the employes. It is far easier to prevent employes from making embarrassing statements in this way than to have to explain them away after they are made. The claim adjuster can signify to the coroner his willingness to assist in the investigation, thus placing himself upon friendly relations. Investigation should, of course, be conducted independently of the coroner, so as to develop the facts rapidly, and, where desirable, the names of reputable witnesses can be placed before the coroner (whose signed statements have already been procured by the claim department), who will corroborate the employes and relieve the company from criticism. While ostensibly, as well as in fact, aiding the coroner, the investigation can be retarded sufficiently to enable the claim department to first interview all witnesses, thus developing the names of the proper persons to place in the coroner's hands.

This gives some idea as to the manner in which accidents should be handled with reference to the investigation.

The question might aptly be asked: Can the claim department be of any service to the company in the investigation of accidents, aside from the mere development of facts upon which to enable the adjuster to make a settlement or reject a claim? We believe it can.

The claim department is, or should be, the one disinterested department in the investigation of accidents, and every facility should be given to enable it to have the fullest information regarding matters about which it is necessary to inquire. An accident occurs, perhaps a derailment, the transportation department, anxious to be relieved from responsibility, claims a faulty track; the track and roadway department says, bad judgment of train crew in rounding a curve; or, perhaps, trolley came off and pulled down wires,—transportation department claims overhead work in bad condition, not lined up properly; or headlight or trolley base out of order, etc., the electrical and motive-power departments say, no, the trouble was due to fast or reckless running or some other cause. The claim department should pursue the matter as carefully as possible, and, when the real facts are

known, make report of same to the general manager for his information.

Then, again, in investigating accidents in the various departments of the service, weak places will develop to which attention can be called and considered by the proper officers. For instance, some dangerous machine in the shops is not properly guarded as the law requires; there may be an exit needed from a dangerous place where men are required to work about the boiler room or elsewhere; foremen or heads of departments may not understand fully the necessity for properly instructing employes regarding the hazards of the work for which they are employed, or of giving additional instruction to employes where they are assigned to work more hazardous than that for which they were employed; the incompetency of conductors or motormen, or others, for one reason or another, may come to the attention of the claim department, and in all such matters valuable service can be rendered by promptly reporting them to the proper officials. It will be necessary, however, for the claim department to show by its work its disinterestedness and its willingness to place above every department, its own included, the good of the company which it serves.

Settling of Claims.

This part of the subject assumes that there has been some one chosen to handle claims, and we will assume it to be the claim adjuster. I have heard of instances (I am pleased to say it has not been my personal experience) where the hands of the adjuster were so tied by foolish requirements that he is not able to get good results. Some managers have so little confidence in the ability of their adjuster that they compel him first to ascertain what a claim could probably be settled for, then report back to the general manager or general attorney, then go back to the claimant and see if he cannot do a little better, then report back to the real adjuster, the general manager or general attorney, and get instructions to settle at one-half to two-thirds of the amount the adjuster had reported, again making trips to see the claimant, until all parties become so disgusted that the claimant goes to his attorney and brings suit, with the result that, in cases of liability or of close question, the company pays double what the adjuster could have settled the case for in the first instance.

If the officials of any road do not have confidence in the ability and judgment of their adjuster, they had better kick him out and get some one in whom they have confidence, and it will prove a benefit to both of them. By all means, if you expect good results, do not hamper the claim agent in his work by any such foolishness. No one but the adjuster can appreciate the delicacy of a situation when it reaches the critical stage, and he knows, or should know, better than any one, when he has gone the limit in the settlement of a claim, or when the claimant has reached the lowest sum at which a settlement can be made. Then is the time to settle, instead of going back for instructions, giving the claimant the opportunity to change his mind.

An adjuster is not necessarily a peculiar individual, but he should possess some qualifications to fit him for this work. At the recent convention at Columbus, O., this question was asked: "What qualifications shall a claim agent possess to be successful?" One of the answers given was the following: "Prepossessing appearance; a personality that attracts; level-headed, with a sufficient fund of common sense to readily adjust himself to surroundings; good judgment (especially of human nature), and with morals and character above reproach." While I am sure many of us do not fill all requirements suggested, the more nearly we approach the ideal, the more successful we will be.

The settlement or adjustment of claims must, necessarily, be governed by the policy of the particular company represented. To my mind, there is but one right policy, and that is, every case should stand upon its merits; if the company is liable for an injury done, pay what is reasonable; if not liable, or unjust demands are made, stand upon the rights afforded by the law.

There are cases, of course, which should be treated somewhat more liberally: For instance, in case of death from an accident where no liability exists, many times settlement can be made for reasonable funeral expenses. This should be done. A serious accident resulting in permanent injury, possibly the loss or partial loss of an arm or leg, can at times be settled for actual hospital and surgeon's bills; it is wise to do this, especially in cases of minors. It is also a good policy to be somewhat more liberal in settlement with employes than with persons having no connection with the company. If employes understand that they will be treated with a reasonable degree of liberality in these matters, law suits from this class of cases will be very few.

In cases where there is a question as to whether or not the company is liable for an injury done, you have about even chances with the claimants before the matter reaches the court, although in court you must expect that the sympathy of the court and jury is likely to be with the plaintiff, for many times the courts treat cases much as the justice of the peace in Kentucky, who said: "Of course the plaintiff had a good case, or he would not have brought it." It is necessary, in view of the prevailing conditions, to make a very clear defense before a corporation can escape a judgment for the plaintiff. In this class of cases, before a suit is instituted, the adjuster can discuss the merits of a claim with the claimant, or his attorney, with a far greater degree of confidence than in liability cases, and usually secure a reasonable settlement.

In cases where the company is clearly liable, about the only ground the adjuster has upon which he can stand is to know his man; touch him in his vulnerable spot; ascertain what the real injuries are; appeal to the claimant's sense of fairness in the most effective way, and make the best settlement he can that is satisfactory to both parties.

In cases of non-liability, where the facts are clear, as a rule, there should be nothing paid. It is this class of cases it pays to contest in court and win. This will give the company a reputation for fair dealing and only contesting cases where unjust demands are made; and with this sentiment prevailing, a corporation will have more nearly even chances in the class of cases where large amounts are demanded for trivial injuries when it becomes necessary to take chances in court. The effect is that other claimants, who hear of these results, will come direct to the company for the adjustment of their claims.

Just here, I would offer the suggestion that there is too little attention paid to giving publicity through the medium of the daily press to cases tried in court with favorable results for the company. It should be a part of the work of the legal department, through local counsel, to see that the local papers publish these matters with other news items.

In cases of injury to stock, or property damage, it pays to be reasonably liberal in the adjustment, as the amount involved is usually small; and, should suit be brought, it would likely be before a justice of the peace, which means a judgment against the company every time, necessitating an appeal to the circuit court, and taking chances on defeating the case there. The expense necessary for defending the matter being as much, or more, than would have been paid in settlement in the first instance.

There is one class of accidents in which the adjuster should be "Johnny-on-the-Spot"; in collision cases where passengers are injured. There are but few matters that will so thoroughly shake a company, from the president down to the train crews doing the damage, as a serious collision between trains where many passengers are injured. Thousands of dollars are involved. It may be a critical time in financial matters with the company, and might mean a receiver. It is in cases of this kind where the attorneys for the company get "cold feet" and say, "Settle; settle at any price," and they are usually seconded by the management. Here is where the adjuster must show his nerve. If he is big enough to handle the situation, and the officials have confidence in him, well and good; if on the other hand the adjuster cannot master the situation, and is forced to call upon all the officials for assistance, many of whom may be unfitted and inexperienced in such work, then the situation is deplorable. A green hand at adjusting can make some mighty dangerous mistakes, and do it unintentionally. There are few of the officials outside of the legal departments (and this is not casting any reflection upon their ability in their own departments) who understand how fully a claimant's rights extend under the law, and how to prepare a release covering all matters growing out of an injury. Take the case of a minor, even though the person injured be past twenty years, but not twenty-one, the personal signature would not bind the claimant, and he would still have the right to sue the company within two years after he reaches the age of twenty-one. The same rule applies to all minors. Cases of this kind can only be settled in Indiana by a next friend by proper proceedings. Then the parents have a claim for loss of service, expenses, care, nursing, etc., which must be considered. In the case of a married woman, not only the claim of the injured party is to be considered and settled, but the claim of the husband for loss of his wife's services, expenses incident to the injury, etc.

In talking about an injury, the conversation is largely confined to the extent of the injuries, and when the amount is agreed upon it is easy to make a general statement that this is to cover all matters growing out of the injury, and prepare the release accordingly, securing the signature of husband or parent as well as the claimant. Should the re-

lease cover only a part of the claims growing out of an injury, the settling of one part amounts to an admission of liability as to the others and suit can be instituted for whatever is unsettled. Should this matter be taken up again, looking to the adjustment of some portion of a claim left unsettled, it is always more difficult to secure a reasonable settlement than had it been done in the first instance.

Quick action in the cases of clear liability is more desirable and in most cases settlement should be agreed upon at first meeting. In cases of very serious injury, this is not possible, as it is not expected that seriously or permanently injured persons will settle for a trivial sum; and even if they did, the settlement could be set aside.

The larger companies have a decided advantage over the smaller ones in this class of cases. They usually have more men in the claim department upon whom they can call in cases of emergency, using their investigators in the adjustment of the minor claims. In collision cases where possibly 100 or more persons may receive more or less injury, it is best to put just as many competent persons as are available at work securing settlement before ambulance-chasing lawyers have time to get at work, thus covering the ground quickly; and, where settlements cannot be made, to establish friendly relations with injured persons.

The manner in which the last serious collision on the lines of our company was handled will illustrate this in a practical way, if you will pardon the personal part of the illustration:

On September 3, last, two sections of a train collided in a curve near Peru. Three cars, well filled with passengers (over 200 in all), were in the wreck. A large number were more or less injured; many received serious injury; a few escaped without injury; no deaths have resulted. The names of 166 of the passengers were secured by train crews. Most of the doctors in Peru were called, and some from Kokomo were pressed into service. The writer was in Detroit, Mich., when he first learned of the accident. On reaching home, as quickly as possible, an alphabetical list of passengers, with a memorandum of injury, was prepared, and a letter of inquiry at once mailed to each, inquiring as to injuries and requesting prompt reply. This quickly developed those who had sustained injury, either serious, slight or trivial, as the next day replies began coming in and the department was in touch with the individuals who needed attention, and, judging from the wording of the replies, the cases needing most prompt attention were quickly looked after. Lists were prepared and a force of three men (a dozen would have been better) were put to work, each taking his own list so as not to conflict in the work, with the result that in 10 days 67 releases had been secured; by the close of September 119 had been settled with (this number exclusive of 39 other releases in other matters taken during the month), and by November 141 settlements had been made. A tabulated statement at that time was prepared, in which was shown the party injured, nature of injury, amount paid in settlement, and the probable amount of verdict had the matter been contested in court, and we had at that date made a net saving from the one accident of over \$15,000, not including any attorneys' fees or costs incident to the matters.

Since that time, several of the more serious cases have been settled. Only five suits have been filed on matters growing out of this accident, one of which has since been settled, and, so far as we know up to the present time, settlement has been made with all but six persons, including the four in suit.

We can demonstrate with reasonable certainty that we have saved the company on this one accident alone over \$20,000.

What should the attitude of the claim department be toward the lawyers? Our experience has been that lawyers, as a rule, should be treated fairly, and they should be protected in settlements made, except in cases where lawyers are known "ambulance-chasers" and in bad odor. These deserve no consideration, for their only motive is to secure blood-money, and they will resort to almost any means to get it. Most lawyers are inclined to be fair in their dealings, though high in price. They usually have the ability to make injuries appear fully as bad as they really are and allowance must be made accordingly. In matters of clear liability, it is better to beat them to the case and get it settled before the lawyer is consulted.

What about the doctor? He is the power behind the throne. Doctors usually have more influence with their patients and can do more with them than any one else. Fortunately, reputable doctors often look upon the legal profession with an eye of suspicion and will, if protected in their bills, assist in legitimate ways in securing settlements. Make friends with the doctors.

The claim department has been dubbed, "the rat hole of

the treasury." In one respect, all money paid out is a clear loss. In what department, however, is there a greater opportunity to save money? Take the cases of serious trouble,—if properly handled, there can be a larger per cent of saving than in many of the other departments. The competent adjuster will guard the dollars in the treasury as carefully as though they were his own. He should have every encouragement to keep the "rat-hole" as small as possible, and, in order that this may be done, no bill chargeable to the claim department, large or small, in court or out, should be paid without the approval of the claim adjuster.

Where a claim department is conducted along the lines indicated, the result should be a small per cent of the gross receipts paid out, and a large saving for the company.

THE COST AND SALE OF RAILWAY POWER.*

BY G. H. KELSAY, INDIANA UNION TRACTION COMPANY.

Cost of Power for Rental Purposes.

As to what factors should be involved when estimating the cost of power for the purpose of sale, there exists a difference of opinion:

First: Cost covering only fuel, labor, repairs, lubricants, wastes and miscellaneous material.

Second: Cost covering in addition to the above, interest, taxes, depreciation on equipment and we might justly include legal expenses in connection with damages arising from the generation, transformation and transmission of such power. These costs truly and logically belong to each and every kilowatt hour of power sold and each unit of power so disposed of without due regard to such items will surely make it that much harder for a company to make a good power plant showing.

Interest and Depreciation.

Then the question arises as to what per cent interest and depreciation shall we add to the fixed charges, such as labor and material, insurance, taxes and all other expenses logically arising from the operation of a power station and transmission line.

The rate of interest is quite easily determined and on this there is not much room for discussion. On the other hand, the rate of depreciation will depend on the class of equipment and the portion of the power of transmission system which is being considered in the particular problem involved, such rate being necessarily of a variable quantity, ranging from practically zero to, in certain electric railway apparatus, as high as 15 or 20 per cent.

On this subject railway men will express different opinions. Some will say that what we take as a depreciation charge should truly be a daily maintenance or repair charge, or that we should keep our equipment up to a standard at all times, while others will say that such depreciation may finally be taken care of by the increased earning capacity and increased value of the franchise of a property. However, a certain per cent should be allowed when selling power to cover what may be termed depreciation, for there will surely be a day of reckoning when we will require new and better equipment or must replace miles of transmission pole line.

To illustrate by an example; on account of the depreciation on a transmission line, the arms and insulators were obliged to be replaced when such arms had been up only six years. This would indicate that 16 per cent should have been allowed each year to take care of the renewals of the arms and insulators so that it would not be such a heavy burden on the road for one season.

The same principle will certainly apply to most all details of the power equipment of the road, but what this rate of depreciation should be is a very much debated question and on which there has not been enough consideration.

Not all managers would care to operate their roads, buying their power and renting transmission lines and distribution circuits from another company, paying for such power a reasonable rate for interest on investment and a fair rate to cover depreciation on the plant and lines, taxes, insurance and all other expenses chargeable in addition to labor and material charge for such power; primarily because a fixed rate to cover depreciation has not been regarded as one of the charges in the operation of a power equipment and to add a conservative rate to the cost of power would very materially increase the per cent of operating expenses of a road as against the showing that is now being made.

Many times statements are made as to what power is really costing, mentioning such figures as 4½ mills, 5, 6, 7 or 8

mills per kilowatt-hour as the case may be, which covers only labor and material charges.

Quoting from one of our recognized authorities on electric railway engineering who writes as follows: "There is a great difference between the cost of power computed from fuel and labor alone, as is often done by those who like to deceive themselves, and the cost with all the items of interest, repairs and depreciation relentlessly footed up. It is not unusual to find the item of depreciation deliberately neglected in computing the cost of power and in other estimates. Street railways have been particularly prone to this sort of financial juggling—it is so convenient to increase the capital account for "improvements" instead of withholding dividends really unearned or shouldering a genuine deficit."

You will note it is not extremely hard to interpret this gentleman's views as to the propriety of a depreciation charge. We are not justified therefore in making a price for the sale of power without giving due regard to a certain per cent to take care of certain expenses, calling them depreciation charges or call them what we may.

Size of Plant and Cost of Power.

In small plants the labor charge is proportionately large and fuel is also large on account of the inefficiency of small units. In larger plants of 1,000-kw. output equipped with approved machinery, the labor and fuel charge decreases very slowly by an increase of the size of the plant, which, however, depends to a large per cent on the character or demand factor of the load which it must handle.

(The author exhibited a curve showing the effect of the increased size of plant on the cost of power per kilowatt-hour at the busbar, this including only fuel, labor, repairs, lubricants, waste and miscellaneous material.)

You will note (curves exhibited) three curves plotted showing cost of power in plants ranging in capacity to as high as 2,500 kilowatts. These curves are given, showing costs per kilowatt-hour for an average output with 40, 50 and 70 per cent of the normal working capacity. These curves are plotted assuming coal worth \$3.00 per ton delivered at coal bins and interest and depreciation are grouped together at 10 per cent per annum. This is somewhat higher than the price ordinarily paid for coal in this locality, but the curves as plotted show some very important facts; that the cost for power per kilowatt-hour at the switchboard is very much higher when including interest and depreciation and is very materially affected by the load power factor.

Cost of Power at Distribution Points.

An estimate of the cost of power at some particular point on a railway system involves some very nice calculation and deals with somewhat uncertain factors, unless proper recording and indicating instruments are at hand for making some determinations.

The true labor and material cost of electric power at power plant busbars is very easily estimated, but a great amount of actual data from existing stations are often valueless on account of not being carefully and completely worked out, and it can readily be shown that there is a great difference between the cost of power, computing only fuel and labor and material items as against the cost of power with all the items of interest, taxes, and depreciation carefully footed up.

Possibly the most practical way to determine the cost of power at any point on a railway circuit is to take the cost at the busbars of the plant as a basis for calculation. This can readily be determined, as a definite sum covering all costs chargeable to the production of each kilowatt-hour of power, by dividing by the efficiency of transmission and transformation to the point of delivery and adding all the costs chargeable to the transmission and transformation of power, such as labor and material charge on lines and substation equipment, taxes, interest and depreciation on all apparatus from power station busbar to point of delivery.

If the power station and substation are equipped with wattmeters for carefully measuring all power, the material and labor cost of direct-current power at any substation on a railway system is fairly well determined by dividing the total labor and material charge for generation, transformation and transmission by the total output of all substations for a given time. This cost will be different at different substations on account of length and size of high-tension line and character of load on high-tension line and substation.

If power is sold at a point midway between substations, losses in the direct-current feeder will be of some magnitude, depending on the railway load and the size of feed copper and the distance between substations.

In figuring cost of direct-current power as delivered to a consumer when located at a point on the railway line some distance from the substation, there should enter into the cal-

*Paper read before the Central Electric Railway Association, Indianapolis, Ind., January 24, 1907.

calculation on such estimated cost, quite a number of elements as follows:

1. Loss in direct-current feeder and track to substation.
2. Rotary and static transformer losses and battery losses where same are installed.
3. High-tension transmission losses.
4. Power house transformer losses.
5. Labor and material costs in maintenance of line.
6. Operation and maintenance of substation.
7. Operation and maintenance of power house.
8. Fuel charges for power house.
9. Interests, taxes, insurance, depreciation and any miscellaneous expenses on all power station and substation apparatus and transmission line.

The efficiency of a railway system from the power station busbar to the car or to a power consumer located at a point some distance from the substation is an element which enters into the cost of power to a degree oftentimes greater than at first thought, ranging from possibly as high as 85 per cent on a direct-current system with ample feeder capacity and medium loads to as low as 50 per cent on an alternating current system with heavily loaded high-tension line, lightly loaded substation and heavily loaded direct-current lines.

The following figures which are of considerable value were calculated by Mr. A. S. Richey and given in a very comprehensive paper on cost of electric railway power production and transmission in the state of Indiana, before the meeting of the Indiana Electric Railway Association in January, 1905.

These values are estimated from a total of all railways generating and transmitting an alternating current, at that time operating in the state. The figures show the per cent of efficiency of the various portions of apparatus from power station busbar to the car consuming the power.

	Per cent.
Efficiency of step-up transformers.....	94
Efficiency of transmission lines.....	97
Efficiency of step-down transformers.....	93
Efficiency of rotary converters.....	80
Efficiency of direct-current distribution.....	80
Combined efficiency	54

The efficiencies appear at first sight very low, but a little consideration will show them to be very logical and represent very close actual conditions when considering an average of all roads operating in the state two years ago.

(The speaker referred to a sketch showing the general method and results obtained in determining the cost of power at the busbars of a certain substation when the power station was equipped with two 50-kw. units with an average load of 63 per cent of one-half of the maximum capacity.)

In the calculation, depreciation which was taken at 7½ per cent was figured on 63 per cent of the total cost of the plant and interest was estimated at 5 per cent on the total cost of the plant. Depreciation was figured on a transmission pole line and substation at the rate of 7½ per cent exclusive of copper on which there was no depreciation charged. Interest was charged on transmission line and substations at the rate of 5 per cent.

In estimating the cost of transmission of power to a substation only that portion of the expenditures on the pole line should be considered which were made necessary on account of such transmission line; that is, that portion necessary to carry the transmission circuit that is not required to support trolley wire, feeder and telephone line.

The results as obtained by the calculation show that \$0.257 should be realized per kilowatt-hour on direct-current power sold at the direct-current busbar at the substation.

Another calculation of the cost of power at the direct-current busbars at a certain substation located 10 miles from power station showed such costs, including all labor and material charge, 5 per cent interest and 6 per cent depreciation, to be very close to \$0.27 per kilowatt-hour.

A similar calculation to determine the cost of power delivered at 15,000 volts 10 miles from a power station realizing all labor and material charges and a conservative rate for interest and depreciation figured such costs to be \$0.16 per kilowatt-hour.

At times a power load may be added to a plant when the price realized for such power be but little above the net labor and material cost, not even paying a good rate of interest on the investment, on the theory that such amount as is realized over and above the labor and material cost reduces by just that amount the cost of power for the railway load. This results in a better showing for the power plant, and greater earnings for the railway company.

This certainly is not a logical way to make a price for power and finally will result in a poor investment.

Developing a Demand for Rented Power. Does It Pay?

The development of a demand for the rental of railway power necessarily depends on the service that the railway

company can give and the adaptability of such power for the consumer. The time when service is obtainable from a railway circuit includes, on most all railways, all hours except from two to four hours in the morning. These hours are the ones during which the consumer will prefer to do without service if he has a motor load, but result in a disadvantage if he is a light consumer. With a properly developed power and lighting load the railway companies should very profitably furnish all-night service over their entire lines except at such intervals of time as are required for linemen to make repairs on the high-tension line, or other interruptions in the service which are beyond the control of the railway company.

The kind of power that a railway company can make a successful proposal to furnish, covers practically every demand for power that can be asked for, where such demand will warrant the installation of the necessary apparatus. Five hundred-volt motor service can be handled at all points along the lines of a railway company where the voltage on the feeder is sufficiently free from fluctuations to permit such a motor to operate.

A very successful alternating-current motor service can be furnished at any point along a railway line where there is a transmission circuit and where the load will warrant the investment in the necessary step-down transformer apparatus.

Lighting from railway circuits may successfully be accomplished in the small towns through the medium of step-down transformers and local distribution at any common operating voltage with either two or three-wire system, furnishing 25-cycle current for such lighting, or, by means of motor-generator set in addition to the step-down transformers, approximately 60-cycle current can be furnished and all the advantages obtained as furnished by our local lighting companies. There may arise a question as to the service obtained by incandescent lighting from 25-cycle current, but such lighting is being done at a great many places without any complaint from customers on account of the low frequency of such current.

Incandescent lighting service can be accomplished through the medium of step-down transformers and low-tension alternating-current distribution circuits, the railway company experiencing but a small per cent of loss from the high-tension line to the consumer and proportionately small first cost on equipment. Such an installation would not require constant attendance.

Arc lights can be furnished directly from direct-current feed-wires, operating five or six lamps in series; thus giving excellent service where the voltage regulation on such circuits will permit such lamps to operate, or if the direct-current lamps cannot be used, 60-cycle arc lamps can be furnished and operated through the medium of a motor-generator set at any town through which the high-tension power line passes.

Nernst lamps operating on 25-cycle current will give very satisfactory results as is reported by the manufacturers, and as has been proven by a number of installations at various places in the east. Successful operation of Nernst lamps requires good voltage regulation, but the efficiency of a Nernst lamp is very high and deserves consideration when contemplating a lighting plant from a railway circuit.

Railway companies should, when going into the business of supplying power for lighting, provide their power stations with regulators so as to obtain more even voltage conditions on their transmission lines. However, a careful study of the voltage conditions on a great many power lines will show better regulation than is furnished by a great many lighting companies.

Smaller towns where the people are not acquainted with the advantages of electric lights will necessarily be a little slow in taking hold of a proposition that might be offered them, but if railway companies will establish a few such lighting plants, giving the consumers the advantage of a very good rate, which the company can certainly afford to do, a demand for such service will certainly grow with little effort on the part of the railway company.

The fundamental question is, does it pay to take up trolley and lighting business along a railway line.

When the railway companies can deliver power to the direct-current busbars of any substation at a net cost ranging from 2 to 3 cents, paying all costs for the generation and transmission of such power and a fair rate of depreciation and interest, or deliver alternating-current power from the high-tension lines directly to the small towns along their lines for a price ranging from 1½ cents to 2 cents or 2½ cents per kilowatt-hour, paying all costs chargeable to the furnishing of such power, they should by adding a reasonable per cent to such cost handle all the lighting business along their lines at a profit to themselves and at the same time give the consumer the advantages of enjoying the privilege of electric light and power.

CAR LIGHTING.*

BY R. C. TAYLOR, INDIANA UNION TRACTION COMPANY.

Few subjects in electric railway equipment have received less attention and deserve more than the question of the proper illumination of electric railway coaches. The modern interurban car carrying passengers over long distances should have its lighting arrangements so designed as to provide

Night View Showing Comparative Headlight Illumination.

sufficient light at all times to give the passengers an opportunity of being able to read with comfort.

The car should also be provided with a headlight burning with sufficient brilliancy to enable the motorman to have a clear view of the roadway far enough ahead to be able to run his car at high speed in the darkness without danger or discomfort to the passengers on his train.

Headlight Requirements.

The car should also be provided with sufficient light for danger signals on the rear end sufficiently bright to enable the motorman on a car approaching on the same track to stop in time to prevent a rear-end collision.

The headlight should be an arc headlight with large reflector so designed, arranged and constructed as to be a permanent part of the car's equipment and if set above the line of vision of the motorman will give a clearer view of the track and more satisfactory light both near the car and at the limit of its range.

The mechanism of the headlight should be strong and simple and reliable with carbons arranged to burn at least six days without renewal. In cities where the ordinances require the screening of the light while passing through streets, a screen of the ordinary type should be arranged as a permanent part of the lamps and facilities provided in the motorman's cab for shifting it to either one or the other of its positions at will.

The headlight should be designed to give a clear view of the track on a clear night, of 3,000 feet. During fog or rain or driving snow this range of vision is liable to be cut down to 500 feet which will be just about as short a distance as a high-speed car can be stopped. This range of headlight view will probably call for an expenditure of energy at the lamp terminals of 5 amperes at 80 volts. This design will provide sufficient light for the "unfavorable" conditions of atmosphere and weather, as it is usually during such unfavorable conditions that an accident or collision is most

liable to occur. The headlight of a high-speed car is considered one of the most important features of its equipments and hence the reason for advocating as strongly as possible and with earnest emphasis the arrangement of keeping one headlight for each operating end of a car.

Tail and Classification Lamps.

Most interurban cars are being fitted up for single-end operation and when so arranged should be supplied with electric tail-lights. These should also be arranged as a permanent part of the car's equipment. Two eight-candle power lamps behind ruby lenses give a very satisfactory set of tail lights. These should be wired up in connection with a clear light when the trolley is removed or the line current interrupted for any reason. Classification lights equipped with colored lenses may also be fitted up on the front end of the car in the same manner as the two tail lights in the rear and be ready for use at any time it may be necessary to run the car as a classified portion of a train.

Lighting the Interior.

The arrangement of lights in the interior compartments of the car should be of such a character as to produce a pleasing effect on the minds of the passengers. Most of our high-speed cars have been designed to attract passenger traffic formerly handled by steam railroads. Our managers have made commendable efforts in designing and furnishing their best cars so as to equal or excel the best rolling stock of other railways and there is perhaps nothing that will enhance the appearance of the car and conduce more to the comfort of the passenger than comes from riding in a well-lighted coach. There are a great many reasons too self-evident for discussion why a car should have plenty of light at every part of the trip.

The fact that out of nine interurban lines running into Indianapolis, the interior lighting arrangements varies from 20 lights to 65 lights per car seems to indicate that there is still room for discussion on the best method of electric car lighting. The performance of these lights on the road and the quantity of light given out seem to indicate there

Night View Showing Comparative Headlight Illumination.

may be room to advocate some improvement in their arrangements.

Arrangement of Circuits.

The usual method of car lighting is to connect five incandescent lights in series and put as many circuits in the car as its architecture will permit, or the fancy of its designer may suggest. The arc headlight is then connected across the

*Paper read before the Central Electric Railway Association, Indianapolis, Ind., January 24, 1907.

line in series with enough iron-wire resistance to cut down the line voltage to 70 volts across the arc.

Power Required.

With this arrangement, assuming a car with seven circuits or 35 lamps, we then have the following energy consumption per car:

Arc headlight and resistance.....	2,700 watts
Thirty-five 16-candlepower incandescent lamps.....	1,965 watts
Total energy consumption for lighting.....	4,665 watts
Energy consumed in light by the arc.....	315 watts
Energy wasted in heat in the arc.....	2,355 watts

In other words there is energy enough wasted through the resistance of the arc to furnish more than sufficient light for the interior of the car.

Resistance and Regulation.

Since the arc lamp as at present arranged seems to be the pivot point around which any suggested improvement might be made, let us assume that enough incandescent lamps are inserted in the circuit to take the place of the resistance and furnish the interior lights. We have a net saving of 1,965 watts per car while the lights are in service. So long as the line voltage remains constant and the resistance of the lamp filaments remains constant, with this arrangement the interior lighting effect in the car will be quite satisfactory; but unfortunately it is very difficult with the very best possible design of feeder arrangement, without involving enormous expense, to maintain anything like a constant voltage over the entire system or even a fair average, and especially is this true on long interurban lines and the results are in a great many cases that the interior lighting of the car becomes very unsatisfactory, indeed. The obvious remedy for this fluctuating line voltage would be to insert in the light circuit some form of regulator or other apparatus to maintain a constant potential on the light circuit irrespective of the fluctuations on the line. Several suggestions for the accomplishment of this desirable condition have been advocated, but so far as known none of them has met with a very conspicuous success. A design for this purpose has recently been brought to my attention in which a portion of the current from the headlight resistance is used in regulating the lighting circuits and the balance of the resistance current is used for lighting a number of specially designed arc lamps for lighting the interior of the car. This system seems to merit full consideration and I believe is on exhibition at this convention.

Another regulator for railway lighting circuits has been designed, which short-circuits a number of the lights in the car, maintaining a constant voltage on those left burning. This regulating system was applied to a car several years ago with quite satisfactory results. There is certainly a demand for such a device for interurban service and it seems quite reasonable to expect that it will soon be on the market.

Use of the Compressor Motor.

In the event of no satisfactory regulator being produced to meet this service this matter of constant potential on the lighting circuit is sufficiently important to warrant the adoption of an independent motor-generator set for car lighting. It is a well-known fact that either the life or efficiency of an incandescent lamp will be very greatly affected if run at a very small percentage either above or below normal voltage. In the design of a new car this detail could be very nicely cared for in connection with the compressor motor. This motor could be designed to maintain a constant speed at a variable voltage and of such capacity as to run the air compressor and lighting circuit. The lighting generator could be mounted on the motor shaft and no additional bearings or frame would be required. On the compressor gear would be mounted an automatic air-operated clutch. The operation of this machine would then be this: When the lights were burning the motor and generator would run continuously, and the automatic air-operated clutch would throw the compressor part of the device out and in to meet the demands for compressed air. When the lights were not required the operation of the compressor would be the same as at present, starting and stopping the motor. This device is so extremely simple, efficient and of such low cost and its results so prolific of beneficial results in giving satisfactory illumination and long life to the lamps, that it should speedily be adopted.

New Lamps.

From the earliest days of electric railroading the time-honored incandescent carbon-filament railway lamp has been the medium of interior car lighting but it seems quite reasonable to expect that further economy and better light for the same or less energy may very soon be looked for by the selection of some form of more efficient lamp. Experiments

have been conducted and incandescent lamps have been manufactured and tested during the past year, having their filaments made of the metals osmium, tantalum or tungsten, with the result that the tungsten lamp has raised the standard of efficiency of incandescent lighting three times as high as the present standard and exceeding in efficiency every form of incandescent or arc lamp except the vacuum tube and flaming arc. Combined with its virtue of high efficiency the tungsten lamp possesses the merit of the simplicity of the present railway lamp and it is hoped may even exceed it in durability. Given, therefore, a high-efficiency lamp that may be made in small units, offering unlimited opportunities of correct distribution, and a constant potential on the lighting circuit the proper illumination of a luxurious interurban car becomes a very easy problem for the engineer. Whether the high-efficiency incandescent lamp or a specially designed arc be employed in the illumination of the modern interurban car they should be surrounded with a frosted or opalescent globe backed up with reflectors against a white background giving a soft, pleasant diffusion of the light in all parts of the interior of the car.

With the car lighting arrangement as outlined the potential of the lighting circuit may be made that which is most suitable for the headlight and the interior lights may be designed for that voltage. This will effect the saving of the energy dissipated through the headlight resistance. The interior lamps may be designed for high efficiency and the total aggregate saving of energy will be the difference between the present practice, 4,665 watts, and the suggested arrangement, 1,850 watts, or a total net saving of 2,815 watts per car. The suggested arrangement therefore presents the pleasing prospect of affording an abundant supply of constant light for the headlights, tail-lights and interior and at the same time effects a very handsome financial saving per car per year over the accepted practice of the present system of car lighting.

A MODEL CAR FOR LONG TRAVEL.*

BY W. H. EVANS, INDIANAPOLIS TRACTION & TERMINAL CO.

In discussing this topic, it might be well to say that it is not my purpose to present a lengthy discussion, but rather to mention a few points which occur to me as being novel and possibly in the way of improvements necessary to meet the requirements of a constantly increasing demand for a better and longer service on our interurban lines. This topic is an interesting one to all connected with the traction interests, and, as presumably it appeals more to those directly connected with the handling of passenger traffic, it is largely from this point that the subject is to be considered.

Limiting Conditions.

It may be well at first to direct attention to a few of the things which largely have prevented the designing and equipping of such as might be called a model car. This applies particularly to the width of cars for interurban service which has so far been limited to 8 feet 6 inches over all. This in turn compels the use of narrower seats and narrower aisles than are used in similar service on the steam-road cars where they are built from 9 feet 6 inches to 10 feet 6 inches in width. It usually occurs that at some point over the line, on which it is desired to run interurban cars, the distance between track-centers is too narrow. In some instances this point is in cities where the streets have been improved and paved, thus making it a very expensive operation to have the so-called "devil-strip" widened. But it would appear that this is something that should be corrected in the near future and at least should very carefully be guarded against in locating new tracks or in rebuilding old lines.

This also applies to curves at right-angle turns and other congested points which interfere with the operation of cars of sufficient length to accommodate the business. While there would appear to be some logical excuse for such restrictions in cities of the larger class, this trouble is frequently found in small towns and villages, where, with a comparatively small additional expenditure for right-of-way, the curves could be made of sufficient radius to permit of the easy operation of any class of equipment that it is reasonable to expect the traffic will require.

Overhead Clearance and Track Gauge.

In this connection, I would also desire to call your attention to the limited overhead clearance under bridges and viaducts, particularly where steam roads cross above the interurban lines. As this is a time when the subject of track elevation is being actively taken up in a large number of cities, it appears extremely important that traction companies should use every effort to get as high an overhead clearance as is

*Paper read before the Central Electric Railway Association, Indianapolis, Ind. January 24, 1907.

possible, keeping in mind the fact that the conditions are rapidly changing. Later it will be necessary to have more overhead clearance and at this time it is impossible to tell what the development of a few years will require in the way of overhead-trolley arrangements to properly take care of the heavier cars and higher voltage. Structures that formerly served for the ordinary city street car to pass under with safety are insufficient to take care of even the larger and later improved types of city-service cars of today, to say nothing of the interurban types.

It is well to bear in mind the type and section of rail which is placed in the improved streets in cities, and above all to insist that the tracks be laid to standard 4-foot 8½-inch gauge.

Present and Possible Routes.

The question of suitable cars for long distance travel is one which is rapidly requiring our best attention, and it will be but a short time until through lines will be operated, on which cars will run from five to ten hours, and possibly more, in one direction. At the present time in the vicinity of Indianapolis this service is operating to Ft. Wayne, Dayton, Lafayette, and Connersville, with the expectation that the latter line will be extended to Cincinnati and through service inaugurated. Also that the other lines will be considerably extended, with the prospect of through service from Indianapolis to Louisville, Terre Haute, Toledo and Columbus, and at each of these points connected with the traction system radiating from those centers.

Suitable Operating Cars.

The type and style of car which appears to have become the most popular with traction companies is similar to the cars at present in service on the Indianapolis & Northwestern system. These cars have been running for some time and those who have been connected with their operation are enthusiastic over this style of car for both local and limited service. Throughout the middle states this style of car is being used, I think, by the majority of the lines. It is usually arranged to run in one direction, but with a control arrangement on the rear platform to facilitate switching and backing up, should occasion require. These cars are seldom shorter than 50 feet nor longer than 67 feet.

These cars are 61 feet 6 inches over buffers and 8 feet 6½ inches over side sheathing. They are composed of three compartments. The forward compartment serves for the motorman's vestibule and accommodates the baggage and express as well as the hot water heater. It is 11 feet 3½ inches long. Directly in the rear of this is the smoking compartment, 13 feet 4 inches long, with seats for 16 passengers. The passenger or coach department is at the rear. It is 27 feet 4½ inches long, with seating capacity for 38 passengers and a roomy platform at the rear, which can be entirely enclosed, the step and door openings being on either side. These cars are liberally supplied with glass in the partitions and there is little to obstruct the view looking forward, depending largely, however, on the amount of baggage being carried.

It is a question in my mind, whether, with the increase of traffic and the carrying of baggage and express on our longer runs and the fact that a large number of commercial men are making use of the interurbans and require that their baggage and sample cases arrive at their destination with them, it may not possibly (in order to accommodate this business) be necessary to have two cars; one to provide liberally for baggage and express and a smoking compartment, and the other to be strictly a coach. So far, however, the car mentioned has taken care of this question as well as anything that has yet been devised in a single car.

A car, very much on the same plan as this, is being operated on one of the Ohio systems, I understand, quite successfully, but it is designed to run with the coach department ahead, the baggage compartment being at the rear of the car, as in ordinary service. This car is 67 feet long over buffers, 8 feet 5½ inches over sheathing and 8 feet 8 inches wide over all. It has parlor chairs and accommodates 29 people in the coach department and 10 in the smoker, with separate toilets for ladies, the men's toilet being located in the rear vestibule at the rear of the baggage room. This places the hopper at the extreme rear end of the car and clearing the trucks, the entrance being through the baggage room. The motorman's cab is at the front end and is so constructed as to obstruct the view of the passengers as little as possible, giving practically all of those seated in the coach department a clear view ahead. The entrance and the exit of the car are at the front end for both motorman and passengers. There is also an entrance at the rear of the car. The doors and steps of this car are placed all on one side, the left-hand or pole-side of the car being entirely free from any door openings whatever, and thus forming a very sub-

stantial and solid construction. Particular care has been taken, with the bottom frame of this car. It consists of six steel I-beams running the full length of the car, and the floor is triple, the bottom being steel plates fastened to the sill, covered with yellow pine flooring and that covered with a floor of hard maple. The passenger compartment in this particular car is covered with carpet.

I am aware that this is to a certain extent quite a radical departure from the usual operation of cars of this character, and while from an operating standpoint, there may be some things which would condemn this practice, there are features which would appear as commendable. Principally among these is the fact that the passengers boarding the car and leaving it are under the direct supervision of the motorman. An arrangement could be devised whereby the motorman would open and close the door, thus preventing passengers from alighting from the car, except at the proper designated stations, and also avoiding numerous accidents from people alighting from the car while in motion. This applies particularly to cases where the conductor is required to go forward and flag a railroad crossing, which frequently results in accidents to passengers at that time. Having the smoking room in the rear is also an advantage, as it is entirely separated from the coach department and the fumes of smoke are never carried into it. This arrangement, however, makes it necessary for the conductor to look after the baggage, which I presume would by some be considered a disadvantage. But it would appear to me that this would be offset by the safety secured by passengers boarding and alighting from the car, under the eyes of the motorman.

There is no question but that being able to view the country from the forward end is a decided attraction for most passengers on interurban lines, and it would appear to have a considerable advantage over the practice of having the observation space on the rear of the train, so long in vogue on the steam-road lines. Particularly in the summer time and in pleasant weather this arrangement should appeal to travelers.

The Future Car.

Being able to look ahead is also quite a relief to passengers who become sick on the cars. This can largely be attributed to looking out through the side windows at passing objects. The motorman is located in a small vestibule which is enclosed with glass windows, thus separating the motorman entirely from being interfered with by the passengers, at the same time offering very little obstruction to the forward view.

It is important, however, that the forward or pilot-end of the car be made as substantial as possible and thoroughly braced and strengthened in order to withstand any impact from collision which might occur. In fact, this is a matter which requires very serious attention from all those who are connected with the designing of traction equipment, particularly so on cars which are to be used on high-speed lines. A considerable improvement has been made in this direction within the last few years with the introduction of steel into the bottom framing, and while this leads to a somewhat heavier car, the tendency is in the right direction, in the way of securing substantial cars, which should be aimed at rather more than cars of elaborate finish or expensive interior arrangement. In fact, it will not be surprising in the next few years to see the all-steel car in common use on interurban roads, judging from the rapid advancement made in this line with subway and elevated railway cars.

It is possible that the car for longer travel will require considerably more conveniences than has been the practice, particularly in the way of toilet and lavatory facilities, and it is pleasing to note that recently considerably more attention has been given to this. Toilet rooms of more liberal dimensions are being designed and in some cases water-flushing hoppers have been installed as well as lavatories. These latter, while they considerably increase the cost and trouble of maintaining the equipment, afford a convenience on the long-travel cars, which we shall probably be required to furnish, notwithstanding the fact that on electric lines very little of the dust and dirt and other inconveniences are experienced incidental to a trip on steam lines having locomotives that burn soft coal.

I would recommend as far as possible that sliding doors be superseded by swinging doors. This will permit of a considerably more substantial framing and bracing at the partition of our longer cars, as the sliding door takes up a space which would otherwise be used to considerable advantage in securing a stronger car.

The governor of Michigan in a recent message to the legislature advocates state supervision of electric railways.

LAKE SHORE ELECTRIC RAILWAY ANNUAL REPORT.

At the annual meeting of the Lake Shore Electric Railway at Cleveland, on January 15, President E. W. Moore gave his annual report to the stockholders, which contains the following statement of the earnings of the company for the calendar year 1906:

	1906.	Increase over 1905
Passengers	\$795,719.12	\$55,197.98
Chartered cars	3,687.56	796.47
Freight	37,454.66	12,831.93
U. S. mail	2,168.20	183.61
Milk	1,949.07	91.40
Advertising	2,130.00	330.00
Car mileage	11,336.69	4,961.21
Interest and discount	1,633.39	*1,173.28
Miscellaneous	4,641.36	*757.63
Gross income	\$860,720.16	\$72,451.69
Operating and taxes	476,257.85	47,669.62
Net earnings	\$384,462.31	\$24,782.07
Interest paid	254,198.34	
Surplus	\$130,263.97	
Other income	6,250.00	
Net surplus	\$136,513.97	\$21,683.63
		Or 18 per cent.

*Decrease.

	1905.	1906.
Per cent operation to income.....	55.33	54.37
Car miles	3,355,661	3,024,393
Gross income per car mile.....	25.65	26.06
Operation and taxes per car mile.....	14.19	14.17
Net earnings per car mile.....	11.46	11.89
Passengers carried	4,761,421	4,337,009

Cleveland division	60.44	\$7,044.00	\$6,335.00
Toledo division	62.25	5,092.00	4,654.00
Sandusky-Norwalk division	16.30	3,177.00	2,900.00
City lines	11.14	5,937.00	5,239.00

Comparative Statement of Gross Earnings Since 1901.

	Gross Earnings.	Increase.	Increase Per cent.
1901.....	\$358,180.35		
1902.....	466,051.35	\$107,870.67	30.01
1903.....	616,484.23	150,432.88	32.28
1904.....	659,873.21	43,388.98	7.03
1905.....	788,268.47	128,395.26	19.45
1906.....	860,720.16	72,451.69	9.19

The company operates 150.13 miles of track, and has 9.87 miles of sidings and storage tracks. The total bond issue is now \$7,000,000, of which \$1,908,000 are outstanding.

During the year 1906 15½ miles of second track was constructed between Rocky River and Lorain, which, together with the sidings, completes the double track between these two points. The company owns and has now in service 54 double-truck interurban cars, 25 single-truck city cars operating in the cities of Sandusky, Norwalk and Lorain. In addition to 29 work cars, making a total of 108 cars. Ten 50-foot interurban cars were purchased during the year, and contracts have been let for 12 additional cars of the same size.

Holding Power of Railroad Spikes.

The Forest Service of the Department of Agriculture has completed a series of tests to determine the holding power of different forms of railroad spikes. The tests were made on ordinary commercial ties of loblolly pine, oak, chestnut and other woods. The spikes used were of four kinds: common driven spikes, a driven spike which has about the same form as the common spike with a lengthwise channel on the side away from the rail; screw spikes of the American type; and screw spikes similar to those in use on European railroads, and differing from the American spike mainly in the manner of finishing the thread under the head.

The common and the channeled spikes were driven into the ties in the usual manner to a depth of five inches. A hole of the same diameter as the spike at the base of the thread was bored for the screw spikes, which were then screwed down to the same depth as the driven spikes. The ties were then placed in the testing machine and the force required to pull each spike was recorded.

The average force required to pull common spikes varies

from 7,000 pounds in white oak to 3,600 pounds in loblolly pine and 3,000 pounds in chestnut. The holding power of the channeled spike is somewhat greater. For example, about 11 per cent more force, or 4,000 pounds, is required to pull it from the loblolly pine tie. The two forms of screw spike have about the same holding power, ranging from 13,000 pounds in white oak to 9,400 pounds in chestnut and 7,700 pounds in loblolly pine.

There is a marked difference between the behavior of driven and screwed spikes in knots and in clear wood. Knots are brittle and lack elasticity, so driven spikes do not hold as well in them as in clear wood. In the case of common spikes in loblolly pine the decrease of holding power in knots is as great as 25 per cent. On the other hand, screw spikes tend to pull out the whole knot which they penetrate. This increases the resistance so much that in loblolly pine the increase of holding power of screw spikes in knots is about 35 per cent over that for clear wood.

ANNUAL REPORT OF THE CLEVELAND & SOUTHWESTERN.

The following data in regard to the earnings and expenses of the Cleveland & Southwestern Traction Company, for the calendar year 1906, are included in the report of President F. T. Pomeroy, presented at the annual meeting of the stockholders on January 15. The comparative statement is as follows:

	1906.	Inc.
Gross receipts	\$645,849.95	\$102,623.20
Operating expenses	363,856.39	49,602.55

PIPING AND POWER STATION SYSTEMS.—XXVII.

BY W. L. MORRIS, M. E.

Condenser Cooling Water Supply.

The economy secured by the use of condensing machinery is such as to warrant considerable outlay in providing a sufficient supply of water and the apparatus necessary for condensing purposes. Ordinarily a condenser equipment will save from six to eight pounds of steam per horsepower-hour. At this rate for a 1,000-horsepower unit the saving would be about 10 tons of coal per day which, at \$1.50 per ton, would amount to \$5,475 per year. If the engine were run only half of the total time the saving would be more than \$2,500 per year which, at 12 per cent for interest and depreciation, would justify an expenditure of \$20,000 for condensing apparatus. In most cases, however, the condensing apparatus would not cost more than the amount that it would save in fuel if it operated one-half of each day for a year's time. In other words, a 1,000-horsepower condensing unit operating under the conditions as stated would save about \$2,000 per year after the proper amount for interest and depreciation had been deducted.

If the supply of water for condensing purposes is reliable the initial cost of condensing apparatus may be considered from an entirely different standpoint. The total cost of buildings, boilers, piping, engines, etc., necessary to develop one horsepower may approximate \$50; then the cost of condensing apparatus, including waterways, apparatus, etc., would be somewhat less than \$4 per horsepower capacity of the total plant, or about \$12 for each horsepower furnished by the condenser. It will be noted that the cost per horsepower for any installation is less for a condensing plant than for a non-condensing one, which will permit the use of less boiler and engine horsepower if the plant is built for condensing. It is safe to state that if water is obtainable for condensing from any other source than city waterworks the saving in installation and operation will justify the expenditure necessary for condensing apparatus. Many plants are run non-condensing with an abundance of water only a short distance away. This fact would seem to show entire unfamiliarity with the subject of condensing, and for this reason if the subject were better understood power plants would be located with more regard to water supply conditions.

The water supply should be the deciding factor in determining the elevation of the power plant. There is, for every water supply, a certain relative elevation most desirable for locating a power plant. One of the troublesome conditions which must be taken into account in determining the datum for the power plant is the amount of variation in the level of the water supply. This is often a condition that cannot be overcome and so the plant must be designed to accommodate the variation in level. An extreme variation is quite objectionable, although a change of level of four or five feet can usually be provided for with but little difficulty.

In Figure 239 (11-1) a power plant with high and low level of water supply is shown in cross-section. In studying the water-supply problem for such a plant the following points should be considered: The distance, *a*, should be as short as possible and not over 16 feet; this is on account of pump suction and expense for deep waterway. The distance, *b*, should be not less than three feet, which will allow the suction pipe to be two feet in the water when it is at the low level. By making *b* about three feet it would be possible to operate the plant, even though for any reason the water should drop a foot or so lower than the previous low-water level. The distance, *c*, is the extreme variation between high and low-water levels. The distance, *d*, should be as much more than *c* as possible so as to give ample fall for sewers. If it is necessary to make this but 12 inches more than *c*, then there should be a sewer valve, *e*, that

can be used in case of higher water level than that established. The distance to the top of the hotwell, *f*, should be sufficiently greater than *c*, to prevent any unusually high water level (more than *c*) from causing an overflow of water into the building.

Choice of Location.

In considering the location of a power plant it would be well to make preliminary drawings of a typical station that would suit the requirements of the load and with this as a basis the value of the more probable sites can be weighed against each other. Some other features that should be given consideration when selecting a power plant location are the switching facilities for receiving coal, location with respect to the center of electrical distribution and the labor question.

If the power plant is to furnish current for an inter-urban railway too much weight should not be given to the apparent necessity for locating alongside of a railroad. It may be found more economical to use sidings connecting with two or more railways crossed or tapped by the electric line and thus handle the coal supply in freight cars drawn by an

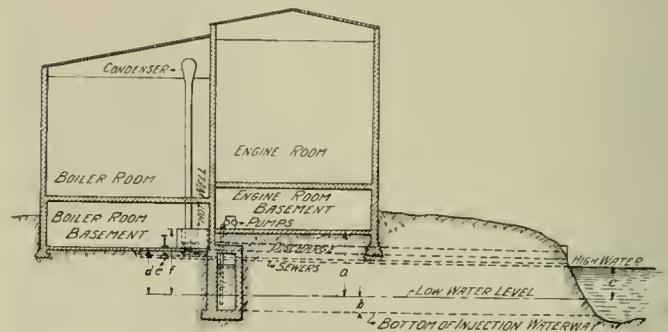

Figure 239-(11-1).

electric locomotive. The availability of two routes for obtaining coal will assure the plant a more probable supply in case of mine troubles as well as afford a protection against indifferent treatment.

If the plant is for an electric railway but little difficulty should be experienced in securing operating men from the towns along the route.

Another feature upon which the relative economy of the plant may depend is its location with reference to other buildings of the same company. If it be located some distance from the administrative department, shops, etc., much time will be lost when repairs are to be made and many economies will be overlooked that otherwise would be secured if the plant were in closer touch with the management. If the various buildings can be centralized considerable more investment will be justified than under other conditions. It may even be found advisable to obtain the condenser-water supply from a considerable distance to permit of grouping the buildings. Such points should be considered on the basis of the investment necessary as the results of operation under the various conditions may easily be estimated.

Supply of Condensing Water.

A knowledge of the geography of the power plant locality is quite necessary when making plans for obtaining condensing water. The chief requirement in such a situation is "to get water." The amount required may vary, but a sufficient volume must always be available for condensing. Possibly no other feature of station engineering requires so much investigation, study and preparation as this one problem. Evidently there is no ideal condition of condenser-water supply. The nearest approach to the ideal is when the plant stands close to a deep, wide stream having but slight variation in its level. But such supplies are not generally to be had where plants are needed.

News of the Week

Interurban Mail Contract.—The Shawnee-Tecumseh Traction Company, of Shawnee, Okla., has been awarded a contract for carrying United States mail between Shawnee and Tecumseh four times a day. Willis E. Fertig, of Shawnee, is president of the company.

Ganz Car For The Erie.—On February 15 the Erie Railroad will receive a new motor car of the Ganz type, now being built by the Barney & Smith Car Company. The trucks, motor equipments, etc., have been received from the Ganz Company, Budapest, Hungary, while the car body has been built in the usual way in the shops of the Barney & Smith Car Company.

Transmission Wires Cut by Order of Mayor.—The transmission wires of the Winnebago Traction Company's interurban line between Oshkosh and Neenah, Wis., were cut last week by the Oshkosh city electrician, by order of the mayor. The city council last August passed a resolution ordering the removal of the high-tension wires and the company had made no effort to obey.

Bill for Cent-a-Mile Passenger Rate.—John F. Joyce, a member of the Indiana legislature from Vigo county, is said to have two bills which he will introduce in the coming session, affecting interurban railroads. One provides for a passenger rate of one cent a mile on interurban roads in the state, and the other requires the erection of passenger stations in cities of more than 35,000 population.

West Penn Railways Increases Wages.—Effective on January 1, the West Penn Railways Company, Pittsburg, Pa., voluntarily raised the wages of its motormen and conductors to 22 cents an hour for the first year, 23 cents for the second and 24 cents for the third year of service and thereafter. The men were also presented with new uniform caps, such as used on steam railroads, as a Christmas gift.

Electric Railway Terminal for Buffalo.—President H. J. Pierce of the Interurban Railway Company, of Buffalo, N. Y., has announced that within two years the company will erect a large passenger terminal for electric railroads, in the heart of the city, to be used by both city and interurban lines. By that time it is expected to be able to travel by electric cars from Buffalo to Erie, Cleveland, Rochester and Toronto.

Worcester Polytechnic Institute.—The annual catalogue of Worcester Polytechnic Institute, just issued, shows that the Institute now has a total registration of 437 students, of which 85 are in the mechanical engineering course, 60 in civil engineering and 92 in electrical engineering. Several new courses are offered. The new electrical engineering building is now nearing completion.

To Permit Cities to Own Street Railways.—State Senator Doris, of Oregon county, Mo., has presented in the senate an amendment to the state constitution to permit cities of 20,000 inhabitants or more to acquire street railways. The amendment provides for acquiring existing street railways or property to be used for street railways by condemnation proceedings, the value of the property to be determined by a petit jury. Funds for such purpose may be provided by a bond issue, to be approved by three-fifths of the legal voters.

A New Electrical Journal.—The second issue of Electrical Engineering, published every Thursday by The Kilowatt Publishing Company, 203 Temple Chambers, London E. C., has been received. Some well illustrated articles by prominent engineers are presented, including "The Designs of Small Motors for Manufacture in Large Quantities," by H. M. Hobart; "Some Points in the Design of Modern Power Stations," by John F. C. Snell, M. Inst. C. E.; "The Generating Station of the Marylebone Borough Council," and "Electrical Engineering in India," by J. W. Mears.

Association for Shop Foremen Proposed.—A number of shop foremen of the Public Service Corporation of New Jersey are taking the initiative in the formation of an association of electric railway shop foremen to hold meetings for the discussion of questions relating to shop practice. A constitution and by-laws are being prepared to be submitted at a meeting to be held in Newark, N. J., on January 29, for which invitations have been extended to all foremen in New York and vicinity. It is proposed to make the association principally a local one at first and to branch out to other cities later. J. R. Case, foreman of the South Orange shops of the Public Service Corporation of New Jersey, is interested.

Interborough Rapid Transit Mutual Benefit Association.—Vice-President E. P. Bryan, of the Interborough Rapid Transit Company, New York, has announced the formation by the company of a mutual benefit association for its employees, to give financial aid to its members in case of accident, sickness or death. The members are to be divided into three classes according to the amount of their salary, the first class composed of those who receive \$35 or less per month, the second those who receive between \$35 and \$75, and the third those who receive \$75 or more. The members will make monthly payments of \$.75, \$1.50 or \$3.00, according to the class in which they are enrolled. The company will assume the payment of any deficit in the relief fund. The management of the association will be assumed by a superintendent and an advisory committee, in the choice of which the employees who are members and the board of directors of the company will

have equal voice. All employees of the company at the time of the inauguration of this system, January 15, will be admitted to membership until July 1, 1907, without examination. At that time the examination system will be introduced.

Committee on Interurban Accounts.—Mr. Calvin S. Tingley, president of the American Street & Interurban Railway Accountants' Association, has appointed a Committee on Interurban Accounts, consisting of W. H. Forse, Jr., assistant treasurer Indiana Union Traction Company, Anderson, Ind., chairman; A. B. Bierck, auditor Long Island Railroad, New York, N. Y., and A. C. Henry, auditor Lake Shore Electric Railway. The committee will hold its first meeting in Philadelphia within a few days. It is the intention of the committee to discuss and plan a new classification of accounts for the use of interurban railways, as the one now in use has been found somewhat restricted and not always sufficient to cover the requirements of long-distance high-speed systems.

Bills Affecting Street Railways in Minnesota.—Two bills for the regulation of street railway companies have been introduced into the Minnesota legislature. A bill placing the electric railways under the supervision of the state railroad and warehouse commission was introduced by Oscar F. Christensen, of St. Paul. The bill provides that all companies now or hereafter operating electric railways for the transportation of passengers, baggage and freight in any city, village, town or county in the state, shall be subject to supervision and regulation by the railroad commission as provided for other railroads in chapter 10 of the new code. The commission shall have power to make reasonable rules and regulations for the operation of electric railways in city or country. A bill offered by A. G. Johnson requires the street railway companies to issue eight tickets for 25 cents.

Address at Purdue University.—Wilson E. Symons, president of the Pioneer Cast Steel Truck Company, 914 Postal Telegraph building, Chicago, addressed the Engineering Assembly of Purdue University, Lafayette, Ind., on January 21. Mr. Symons chose for his subject "Theory versus Practice in the Work of the Mechanical Engineer." Drawing upon an extensive personal experience, he presented his subject in a manner which was most interesting and instructive to his student audience. He described the helplessness of a man trained in theoretical matters only, discussed with care and discrimination the limitations which surround one whose entire stock in trade is his practical experience, and drew a fine picture of the opportunities which await the one who combines the theoretical with the practical. Such a combination he regarded as essential to the development of the ideal engineer.

Rewards to Employes for Satisfactory Service.—The Boston Elevated Railway Company, on December 29, distributed about \$60,000 in gold among its uniformed car service employes as special reward for good conduct and satisfactory service during the year 1906. Nearly 4,000 men each received a \$5 and \$10 gold piece. The rule of the company governing the distribution is that all employes who have been in the car service for six months or longer, and who have rendered continuous and satisfactory service throughout the year, will at the close of each year receive a reward of \$15. Conductors, motormen, brakemen, guards, station masters, starters, inspectors, and, in fact all who wear the uniform of the car service, including the special police officers, are included in the distribution. About 87 per cent of the total number of men who have been in the service as long as six months have been listed to receive the reward.

To Determine Value of Superheated Steam for Locomotives.—The Carnegie Institution of Washington, D. C., has made a grant of \$3,000 a year for a period of four years to Dean W. F. M. Goss of Purdue University, Lafayette, Ind., for the purpose of determining the value of superheated steam in locomotive service; first, in connection with single-expansion engines, and second, in connection with compound engines. This is the second grant which the institution has made to Dr. Goss. While given to him personally, its effect will be to stimulate and to make more effective the work of the Purdue locomotive laboratory. Funds thus received will be employed in supplementing the resources of the laboratory as derived from all other sources. The results of Dr. Goss' previous research under the auspices of the Carnegie Institution, which was for the purpose of determining the value of different steam pressures in locomotive service, is now in press.

Escalators for New York & Long Island Tunnel.—The New York & Long Island Railroad Company, which is building the so-called Belmont or Steinway tunnel system, has awarded a contract to the Oits Elevator Company for the two largest escalators ever built, to be installed in the Manhattan terminal of that system at Forty-second street, between Lexington and Third avenues. Trolley cars instead of trains are to be operated in this tunnel and by running on a short headway will have a large carrying capacity. It is estimated that the capacity of the tunnel will be at least equal to that of the trains of the Brooklyn bridge during rush hours and that the escalator equipment will be equal in point of capacity to the entire stairway equipment of the Manhattan end of the Brooklyn bridge. Furthermore, not only will the escalators be sufficient to handle any number of people up to the capacity of the cars of the tunnel, but they will also serve to marshal the crowds into streams of people moving uninterruptedly without coming into conflict with one another. The escalators will provide service between levels slightly over 55 feet apart and will be arranged side by side. Most of the time one will be operated ascending and the other descending, but during the morning rush hour both will be operated ascending. As an appropriation has already been made for a new Manhattan terminal to the Brooklyn

bridge, which is to be located underground, it will be interesting to note whether this municipally-owned enterprise will be as progressive as the privately-owned one in the matter of installing moving stairways. Neither the escalators nor any part of the entire terminal will possess any woodwork or other inflammable material. The escalator is the invention of Mr. Charles D. Seeburger, who is now head of that department of the Otis Elevator Company.

Cleveland Traction Situation.—President H. E. Andrews, of the Cleveland Electric and President A. B. Dupont, of the Municipal Traction Company, held a conference on January 18 to discuss various phases of the plan by which the Municipal Traction Company proposes to form a holding company to take over the Cleveland Electric property, under a leasing plan similar to that under which the Municipal company now operates the Forest City Railway. While no details were given out it was announced that fair progress had been made and that there is nothing to indicate that a settlement cannot be reached. Both presidents stated that there are no grounds for the reports that the matter of price is likely to prevent a settlement. Daily conferences have been held throughout the week, at which various other officers of the company have participated, and it is stated that several points in regard to the procedure to be adopted in determining on a valuation have been settled.

Electric Railway Express Company Retires.—The Electric Railway Express Company, of East St. Louis, Ill., announced on January 17 that it would go out of business as soon as its affairs could be wound up. It is not yet known whether it will be reorganized. The company operated over the East St. Louis & Suburban Railway, which owned the express cars and furnished the motormen and conductors. The winding up of the company's affairs is said to be due to dissension among its stockholders, most of whom are also interested in traction companies, and not on account of any financial difficulties. It has conducted a heavy express business in the last few months. New cars were ordered recently for the Alton line, which was opened two months ago. Two of these cars have not yet arrived from the shops. Depots are maintained at Broadway and the Levee, in East St. Louis, Alton, Belleville, Edwardsville, Collinsville, Lebanon, O'Fallon, Maryville, Caseyville and Edgemont. Superintendent J. F. Johnston has instructed the company's agents to accept no more business.

Interurbans Not Required to Erect Stations at All Stops.—Traction lines in Ohio will probably not be required to observe, literally, the section of the new Ohio railroad law which requires the erection of a passenger station at all regular stops, to be kept properly heated and lighted. Mr. O. P. Gethlin, member of the Ohio railroad commission, in an informal interview recently said that a strict interpretation of the law would be manifestly unjust to the interurbans, many of which are required by their franchises to stop at all street and road crossings and many farms along their routes, when there are passengers that wish to alight from or board the cars. Interurban roads that are not bound by such franchise provisions, Mr. Gethlin said, would undoubtedly omit many of these stops if the provision of the law were interpreted literally, as applied to them. Mr. Gethlin further said that if the question came up to the commission, to be decided on a complaint of any kind, it would probably interpret the law as applied to traction lines to include only principal stops in towns and villages through which they pass, holding the stops at cross roads or farms to be accommodation or flag stops. A number of interurbans are erecting small shelter houses at many of these latter stops.

Chicago Traction Situation.—There have been no especial developments in the Chicago street railway situation during the past week. Both the city council's official referendum petition and the one issued by the Referendum League have been circulated assiduously, but from latest reports there appears little probability of the requisite 86,000 names being secured before February 1. President T. E. Mitten, of the Chicago City Railway Company, on January 19 issued a statement of the company's position in regard to a referendum vote. He said that while he should be gratified to have the ordinances approved by a popular vote such a proceeding would delay the rehabilitation so that the improved service could not be secured by next winter. The board of supervising engineers must be organized and plans decided upon at once in order that the necessary contracts may be awarded in time to secure increased power before winter. The company has options expiring on February 1 for 300 new Brill cars of the most improved type and the options cannot be extended without the payment of a large premium. The company is now receiving 100 cars of this type which are put in service as fast as received. One of them was exhibited at the Electrical Show and received high praise from all who examined it.

Helpers for Conductors in Rush Hours.—The Pittsburg Railway Company has adopted a plan for relieving the conductors of some of their duties during rush hours and has employed 50 students from the Carnegie Technical School who act as helpers on the rear platform. The "trolley boys" duties are to keep an eye on the trolley wheel and replace it if it comes off the wire and to give the bell signals for the motorman to stop or start the car to take on or let off passengers, thus leaving the conductor free to remain inside the car and collect the fares. Incidentally to help the conductor to keep account of the new passengers. The benefits from the new system are manifold. With but one conductor on a car it was necessary for him to collect fares and direct the movement of the car at the same time. While working inside the car it was impossible for the conductor to see passengers getting on or off, and he had to depend upon passengers

on the rear platform to announce when everything was all right. This resulted in much delay and many serious accidents from the car being started too soon. Under the new system the "trolley boy" boards the car at the downtown terminus and relieves the conductor of the work on the rear platform until the car reaches Oakland, by which time the conductor has completed collecting fares and is able to give his attention to the operation of the car. Leaving the car at Oakland the "trolley boy" returns to the downtown district on the next car. In speaking of the new system James D. Callery, president of the Pittsburg Railways, said: "This has been an experiment, but I think it has been demonstrated that it is the safest way to operate the cars during the rush hours, and the innovation will be extended as rapidly as possible. The two-man system will become permanent if a thorough test shows that it is productive of better service to the public."

Is Car Running Along State Line Engaged in Interstate Commerce?—The Nashville (Tenn.) Banner prints the following statement in regard to a unique complication under the interstate commerce law which exists in Bristol, Tenn.: "Edwin M. Walker, manager of the Bristol Belt Line Railway Company, states that his company will not issue complimentary passes to anyone this year on account of the restrictions of the new federal rate regulation act. The attorneys of the company have decided that the electric line is an interstate railway and for this reason subject to the anti-pass provision. The situation is a decidedly unique one. The electric cars are operated almost entirely in Bristol, Tenn., except over State street. On this street the car line is astride the state line for half a mile, one rail being in Virginia and the other in Tennessee. This, it has been decided, makes it an interstate railway. However, it would be possible for the passenger to make the entire trip through the city without getting into Virginia, but in order to do this he would have to be seated on the south side of the car during the run through State street. Passes might be issued provided the parties thus complimented should agree to always cling to the south side of the car, but for fear of complications, no passes will be issued."

Bill to Give Eminent Domain to Interurbans.—A bill has been introduced in the Texas legislature to give the right of eminent domain to electric railways between cities and towns in the state. A right of way 200 feet wide is provided for. Section 3 provides that: "Such corporations shall have the right and power to construct their railways along, across and over any stream of water, water course, bay, navigable water, arm of the sea, street, highway, plank road, turnpike or canal which the route of such railway shall touch and shall have the right to erect and operate bridges, trams, trestles, or causeways over, along, across any such streams, water courses, navigable water, bay, arm of the sea, street, highway, plank road, turnpike or canal; provided however, that any such bridge or other structure shall be so erected as not unnecessarily or unreasonably to prevent the navigation of any such stream, water course, bay, arm of the sea or navigable water, and provided further that nothing herein contained shall authorize the construction of any such electric railway upon or across any street, alley, square or property of any incorporated city or town, without the assent of said corporation of said city or town, and that in case of the construction of any electric railway along highways, turnpikes or canals, such interurban electric railway company shall either first obtain the consent of the lawful authorities having the jurisdiction of the same or shall condemn the same under the provisions of the law."

Retail Merchants' Plan to Regulate Philadelphia Rapid Transit Company.—The Retail Merchants' Association of Philadelphia on January 21 submitted to the directors of the Philadelphia Rapid Transit Company and to the public a complete plan for improving the street railway situation in that city, which is said to be in a very serious condition on account of the financial difficulties of the company and its inability to secure funds for improvement. One of the principal reasons for the company's lack of credit is considered to be a provision in a city ordinance of 1857 which gives the city the right to take over the street railway property at any time on payment of the cost of construction. The plan of the Retail Merchants, in brief, is to repeal this ordinance, in return for which the company is to exchange its present unlimited franchises for a new grant running for fifty years, the city reserving the right to purchase the property at the end of that period. Under this plan the company and the city would enter into a sort of partnership contract by which the city is to share equally in the net profits after the stockholders have received lawful interest on their investment, from January 1, 1907. The company is to call in at once the balance due on its stock, \$12,000,000, to be used for improvements. The city shall have the right at any time after 50 years to purchase all the rights and property for the amount of the paid-in capital, \$30,000,000. This option is to be assignable or to be sold to the highest bidder. A sinking fund, to be taken from the gross receipts, is to be established, which, at 4 per cent will amount to at least \$30,000,000 at the end of the franchise period, to enable the city to acquire the property at that time. All improvements are to be financed on bonds running for not more than 50 years. All franchises for further street railways are to be first offered to the company. The mayor and two other city officials are to have the right to be present at directors' meetings and vote, but are not to incur any liability, nor shall the city incur any liability for the obligations of the company.

The Philadelphia Rapid Transit Company owns or controls about fifty subsidiary companies, comprising the entire street railway system of the city, most of whose franchises run for 99

years. The company is so overcapitalized that the rentals which it must pay to the leased companies imposes a very heavy drain on its earnings and it is unable to finance the new lines for which it has secured franchises in recent years and which are necessary to the city's development. The merchants' association believes that its plan will restore the company's credit so that it will be possible to make the needed improvements and at the same time give the city the desired control over its transportation facilities.

Long Journey of Private Electric Car.—The private car "Josephine" left Cleveland on Tuesday, January 2, at 4:30 p. m., for Indianapolis, carrying the officials of the Everett-Moore lines and a number of invited guests to the annual meeting and banquet of the Central Electric Railway Association, which was held at the Hotel Claypool on January 24. The route was over the Lake Shore Electric from Cleveland to Toledo; the Toledo Bowling Green & Southern to Findlay; the Western Ohio to Lima; the Ft. Wayne Van Wert & Lima to Ft. Wayne; the Ft. Wayne & Wabash Valley to Peru; and the Indiana Union Traction to Indianapolis. Those included in the party were: General Manager F. J. Stout and Secretary F. W. Coen of the Lake Shore Electric; General Manager Joseph Jordan and Assistant Secretary Smock of the Cleveland Plainville & Eastern; C. F. Franklin, president of the Toledo & Western; Allen Edwards, purchasing agent of the Detroit United Railways; C. F. Smith, general manager of the Toledo Bowling Green & Southern; F. D. Carpenter, general manager of the Western Ohio; C. D. Emmons, general manager of the Ft. Wayne & Wabash Valley; F. T. Hepburn, general manager of the Lima & Toledo; H. A. Nicholl, general manager of the Indiana Union Traction; Joseph Young, general passenger agent of the Toledo Railways & Light; H. C. Young, general passenger agent of the Lake Shore Electric; L. K. Burge, superintendent of transportation of the Lake Shore Electric; J. T. Ross, chief engineer of the Everett-Moore properties; John Witt, secretary to E. W. Moore, and T. H. Hogsett, counsel of the Lake Shore Electric.

Attorney General of Missouri Refuses to Bring Suit Against United Railways.—Attorney General Hadley, of Missouri, has declined a request made by Attorney Charles Fensky that he institute proceedings to forfeit the franchises of the various street railway companies formerly doing business in the city of St. Louis which have transferred their property and franchises to the United Railways Company, and also for the institution of a similar proceeding for the forfeiture of the charter and property of the United Railways Company. After a public hearing, which was attended by representatives of the United Railways Company and of the city council, Mr. Hadley has replied to Mr. Fensky, stating that in his opinion the statute under which the consolidation was effected is not unconstitutional, as claimed by Mr. Fensky, as it is not a special law but a general one, and as the constitutional prohibition against the consolidation of parallel and competing roads refers only to steam roads. In answer to the contention that the United Railways is using the streets of St. Louis for the purpose of carrying freight other than express, Mr. Hadley says that it was stated at the oral hearing that as a matter of accommodation the United Railways had carried dirt taken from excavations for buildings in St. Louis. The representatives of the railroad contended that this had only been done in a few isolated cases, and gave assurances that the practice would thereafter not be engaged in. In regard to the contention that the United Railways Company did not at the time of its incorporation have on hand the amount of money required by law or stated in the articles. Mr. Hadley says that Mr. Fensky has furnished no evidence in support of his claim, and that even if true it would not, in his opinion, at this late day, furnish a justification for the institution of ouster proceedings. Mr. Fensky states that he will next ask Circuit Attorney Sager to institute proceedings.

Metropolitan Street Railway Equipping Closed Cars with Vestibules.—All the closed cars of the Metropolitan Street Railway, of New York, are being equipped with vestibules as rapidly as the parts can be obtained from the manufacturers. Already there are about 200 vestibuled cars in use and new cars are being equipped at the rate of 15 a day. By the time the open cars are again put into service it is expected that there will be at least 1,200 vestibuled cars in daily use. The rest of the cars will be equipped during the summer, so that the next year all the winter rolling stock of the surface lines will be vestibuled. The policy of the company, as stated by General Manager Oren Root, is to equip systematically a certain number of cars on each of its lines in order that at the earliest possible moment all the cars on night service may be vestibuled. The cars in night service on the more exposed lines are now entirely vestibuled. The work of equipment is being done, under the supervision of the company's engineers, in the barn headquarters of the several lines. Mr. Root said: "It is not the expense, which is, however, very large, but other considerations which have deterred the Metropolitan from adopting vestibules long ago. We recognize, of course, their many good points, and the increase of comfort their use brings to the motormen and conductors. But we have also considered the well-known fact that with vestibules the danger of accident is largely increased in any event; and, furthermore, that what is true of vestibuled cars in general can be said of them with much more force when New York city is concerned, for here we have a whole set of traffic problems that are met nowhere else in the world. If we have appeared to hesitate in regard to the adoption of vestibuled cars it is only because our doubts as to their availability for our use, considering the extraordinary conditions existing here, have been outweighed by our care for the welfare of the men."

Construction News

FRANCHISES.

Brooklyn, N. Y.—The Nassau Electric Railroad Company has been granted a franchise by the board of estimate for a surface line in Livingston street. This line, when built, will relieve the congestion in Fulton street caused by the construction work on the subway extension. The board also authorized the issuance of stock to the amount of \$49,000 for improvements in Livingston street. The company agrees to pay the city 3 per cent of its gross receipts with a surety deposit of \$10,000.

Carbondale, Ill.—The Southern Illinois Transit Company is applying for a franchise for an electric road from Carbondale through Murphysboro, Carterville, Herrin and Johnston City, Ill.

Cody, Wyo.—A franchise has been granted to the Northwest Wyoming Construction Company to build a broad-gauge electric railroad connecting the town of Cody with the terminus of the Burlington railroad across the river. The company will begin construction inside of six months. It is proposed to extend the line to the sulphur works near town, and in time to connect Cody with the adjoining small towns and ranching settlements. Tracks will also be run through the alleys so that loaded freight cars can be transferred from the Burlington to the warehouses in town.

Connersville, Ind.—The city council has granted a franchise to the Connersville Street Railway, of which R. N. Burgess is vice-president.

Fremont, O.—The city council has granted to Webb C. Hayes, John F. Worst and Frank Heim a 25-year franchise for a belt line street railway, said to be in the interest of the Toledo Port Clinton & Lakeside Electric Railway.

Louisville, Ky.—The Louisville Railway Company has been granted a franchise to use the Bardstown road for the extension of its line to Fern Creek.

Pittsburg, Pa.—The committee on routes of the Pittsburg city council's rapid transit commission has approved the proposed routes of the Pittsburg Subways Company, as provided in the original ordinance submitted by the company. The executive committee has also adopted recommendations as to the compensation to be paid the city in return for a 50-year franchise, as follows: City to receive 2 per cent of the gross earnings for the first 10 years, 5 per cent for the next 15 years, and for the next 25 years an amount to be fixed by a board of appraisers, consisting of the mayor, the president of the company and a third person. At the end of 50 years the city is to have the right to purchase at an appraised value, which shall represent the cost of construction and equipment less depreciation without regard to earning power. If the city does not desire to purchase the franchise shall be given to the company offering the most advantageous terms, which shall have the right to purchase the property on the same terms as the city. The company shall file an indemnity bond of \$500,000. President Lovejoy, of the Pittsburg Subways Company, has announced that these provisions are not entirely satisfactory.

Toledo, O.—The city council has granted a franchise to the Toledo Port Clinton & Lakeside Railway, of Toledo, for a branch line to the state rifle range.

St. Louis, Mo.—The St. Louis Fern Ridge & Western Railroad has filed its acceptance to the modifications of its franchise with the county clerk. Its bond of \$5,000, required by the county court, was also filed. The company has a franchise to build a road from the city limits to Etzel avenue, west to the Olive street road, and out that thoroughfare to Studt's park, Creve Coeur lake. The promoters say that under the modified franchise no trouble will be encountered in financing the road. A great part of the amount required has been raised by the property owners along the route, who declare they will build the road at once.

St. Louis, Mo.—The Hillsboro Kimmswick & Southern Railway has been granted a 50-year franchise to build an electric line for freight and passenger traffic on the Lemay Ferry road from the southern city limits to the Meramec river with the following provisions: Freight may be carried from 8 a. m. to 6 p. m., but must not interfere with the passenger business; fare 5 cents; within 30 days from the acceptance of the franchise the company must file a bond for \$5,000 with the county and renew every five years, and within six months must be started on the line; a deposit of \$1,000 must be made to protect repairs on the roadway. W. Gutke, president; Lee A. Hall, secretary.

St. Louis, Mo.—The bill authorizing the St. Louis Electric Terminal Company to build single and double track lines in the city to give the Illinois Traction System terminal facilities in St. Louis, which has been before the municipal assembly for about six months, has been reported without recommendation by the committee on legislation. The bill will be considered by the assembly on January 29, at which time it is expected that several amendments will be offered.

San Francisco, Cal.—A franchise has been granted to the United Railroads of San Francisco for the extension of its Sixteenth street line, by the terms of which 3 per cent of the gross receipts for the first 5 years, 4 per cent for the next 10 years and 5 per cent for the last 10 years, goes to the city.

South Bend, Ind.—M. C. Welsh has been granted a franchise

by the county commissioners to construct an electric railway between South Bend and Raymond, Ind. It is stated the line will be built immediately and be in operation within a few months.

Spring Bay, Ill.—A franchise has been granted to the Chicago Milwaukee Peoria & St. Louis Railway Company for right of way through the village and a 40-foot frontage on Lake street. It is said that the company proposes to build an electric railway from Chicago to Peoria by way of Aurora, La Salle and Lacon, Ill. In return for the franchise the company will erect a depot at Spring Bay, the ground for which will be donated by Capt. C. A. Zellar, president of the village board. It is stated that the line will touch the towns of Magnolia, Hennepin and Lasant between Lacon and Spring Valley. H. F. Cherry, of Lacon, is interested.

Tacoma, Wash.—Merle G. Wightman and C. E. Muckler have accepted the franchise granted by the council on December 12 for an electric line between Tacoma and Seattle and have filed a check for \$1,000 with the city officials. The line must be in operation in two years.

Winterset, Ia.—A franchise has been granted to the Des Moines Winterset & Creston Electric Railway on the same terms as that granted at Creston. The company has now secured 60 per cent of its right of way and has made arrangements for terminal facilities in Des Moines. W. D. Skinner, of Des Moines, president.

INCORPORATIONS.

Central Interurban Traction Company.—Incorporated in Missouri to build electric railways in St. Louis to connect with the Hillsboro Kimmswick & Southern Electric Railway, incorporated last year by the same interests to build from St. Louis to Flat River. Capital stock \$50,000. Incorporators: Charles A. Gutke and John A. Laird, of St. Louis, and others. The company has applied for franchise in St. Louis over a route paralleling several of the lines of the United Railway on the south side of the city. A three-cent fare is stipulated.

Citizens' Railway Company.—Incorporated in Illinois to take over a line about a mile long running from State and Senate streets, Venice, Ill., to the Mississippi river, which has been purchased by the Illinois Traction Company from C. M. Clark, of Philadelphia. Capital stock, \$5,000. Incorporators: B. L. Bramble, C. A. Wright and C. E. Cox, all of Champaign, Ill.

Corn Belt Traction Company.—Incorporated in Illinois to build and operate an electric line between Bloomington and Champaign through McLean, Dewitt, Platt and Champaign counties. It is said the road has been surveyed as far as Leroy and will follow the general line of the Big Four Railroad. Capital stock, \$100,000. Incorporators, William McKinley, Peter W. Moore and Earl D. Riddle, of Leroy; Lewis B. Thomas and Henry C. Larsh of Bloomington, Ill. Officials of the Illinois Traction Company disclaim all knowledge of this company.

Detroit Jackson & Chicago Railway.—Incorporated in Michigan to take over the Detroit Ypsilanti Ann Arbor & Jackson Railway for the Detroit United Railway. Capital stock \$25,000. Incorporators: F. W. Brooks, Joseph Bampton, A. E. Peters, A. F. Edwards and Irwin Fullerton, all associated with the Detroit United Railway.

Ithaca-Seneca Falls Electric Interurban Railway.—Incorporated in New York to build an electric road with a capital stock of \$1,000,000 of which \$100,000 will be raised by local subscription. Officers: President, Jacob Rothchild, Ithaca; vice-president, C. S. Hood, Seneca Falls; secretary, J. N. Hammond, Seneca Falls; treasurer, F. M. Bush, Ithaca. Directors: Thomas J. Clary and Ole Williams, Seneca Falls; F. L. Hawes, Ithaca; William P. Biggs, Trumansburg; Ogden Wheeler, Romulus.

Nevada Mason & Los Angeles Railway.—Incorporated in Nevada with a capital stock of \$1,000,000 to build an electric railway from Wellington to Nahuaka, Nev. President Newton Evans, of Los Angeles, Cal.; secretary, F. W. Fairbanks; treasurer, J. G. Kaufman.

Seashore Municipal Railroad.—Incorporated at Albany, N. Y., to construct a five-mile electric road from Hempstead to East Rockaway, Nassau county. Capital stock \$150,000. Incorporators: P. E. Ames, Long Beach, M. H. Day, Brooklyn and H. E. Briatol, Rockville Center, N. Y.

South Carolina Public Service Corporation.—Incorporated in South Carolina to build an electric line in South and North Carolina and Georgia. Mr. Lawrence M. Pinckney, a representative of the company, has given out a general statement concerning the plans which are practically as follows: The road will extend from Charleston to Columbia, S. C., branching to Springfield and Alken, S. C., and Augusta, Ga. The northern division will run from Columbia by way of Winnsboro, Chester, and Rock Hill to Charlotte, N. C.; the western division by way of Lexington, Saluda, Greenwood, Anderson and Abbeville to Greenville. From the latter point the road will form a loop by way of Spartanburg and Union to a junction with the northern division at Chester. Another division will also start from Saluda and run to Newberry, Clinton and Laurens, S. C. The interurban passenger traffic will be handled by four large motor cars while the through passenger traffic will be cared for by express trains made up of two or more coaches with the multiple-unit system of control. The freight traffic will be handled in ordinary steam railroad freight cars for purposes of interchanging with steam roads. Electric locomotives similar to those used on recently electrified steam lines will be

the motive power. There will be three or more water-power stations and a steam plant near Charleston which will generate current at 33,000 volts. This will be transmitted by the high-tension transmission line to substations along the line where it will be stepped down to pressures suitable for the operation of cars and for sale to municipalities and industrial enterprises for lighting, heating and power purposes. The company is capitalized at \$10,000,000 and has general offices at 51-53 Broad street, New York. The officers are: President, Joseph J. Timmes; vice-president and general manager, Charles R. Van Etten; secretary and treasurer, John P. Bonney. Directors: Joseph J. Timmes, C. R. Van Etten, John P. Bonney, Joseph Bermei, Lawrence M. Pinckney, John C. Lott, Dow S. Smith, Frederick W. Schroeder and Robert H. Jennings.

Staten Island Midland Railway.—Incorporated in New York as a reorganization of the Staten Island Midland Railroad, of Stapleton, N. Y., which is now in the hands of receivers, S. F. Hazlet and Eugene B. Howell, 26 Broadway, New York. Capital stock \$1,000,000. Incorporators: Isaac A. Levy, M. K. Katz, and Joseph G. Switzer, of New York.

Waupaca-Green Bay Railway.—Incorporated in Wisconsin to build a line from Waupaca to Scandinavia, 11 miles. Capital stock \$150,000. Incorporators, A. G. Nelson, A. M. Penney and John Gordon, Waupaca; A. Aggerback and W. B. Johnson, Chicago.

Wisconsin Electric Railway.—Incorporated in Wisconsin with large powers to build, acquire and operate electric railways, lighting plants and other public service properties. Capital stock, \$50,000.

TRACK AND ROADWAY.

Brownsville Masontown & Smithfield Electric Railway.—This company has surveyed its line from Masontown, Pa., west to Riverview; also from Masontown north via Lardin to Edenborn, Lambert and Brownsville; and from Masontown via Martin to New Geneva, a total of about 15 miles, through a new coke country. W. J. Sheldon, of McKeesport, is president; E. L. Schmidt is chief engineer, and C. A. Smith, superintendent of construction. Capital stock \$150,000. Right of way has been secured for five miles.

Chihuahua, Mex.—The company owning the street railway system of Chihuahua, Mexico, which is now being operated by horse-power, will shortly change to electricity, using the overhead trolley system. Bids will be received in the near future for cars, rails, overhead fixtures, and machinery for the power plant. A liberal concession has been granted the company by the state government, and under this concession the company proposes to construct 20 miles of line, half of which will be constructed as soon as material can be obtained and the balance as traffic demands it. The gauge of the track will be 4 ft. 8½ ins., and 80-pound T-rails will be used. A. C. Nash is general manager.

Cincinnati Georgetown & Portsmouth Railroad.—It is reported that a contract has been let to Thomas Daulton, of West Union, O., for an extension from Russellville to West Union, 14 miles. H. Baluss, general superintendent, Cincinnati, O.

Columbus Delaware & Marion Railway.—This company has resumed work on its Bucyrus extension in Crawford county and expects to have cars running on the new line by July 1. There are still several pieces of right of way to secure in Marion county and when this is done work will commence on the Marion end of the extension.

Elgin & Belvidere Electric Railway.—The line from Elgin to Belvidere, 36 miles, was put in operation on January 12, when a party of officials and guests made a trial trip from Rockford to Elgin over the new line and the Rockford & Interurban Railway. Regular service will be started in a few days, as the track is in good shape. The cars will enter Elgin for the present over the Aurora Elgin & Chicago tracks. A continuous trip is now possible from Chicago to Freeport. Hamilton Browne, of Geneva, Ill., is president; George F. Faber, of Marengo, Ill., is superintendent.

Elk Street Railway.—W. S. Ravenscraft, Ridgway, Pa., is president of a company, which proposes to build an electric railway from Johnsonburg to St. Mary's, Elk county, Pa., 18 miles. The capital stock of the company is \$500,000.

Hamilton Radial Electric Company.—This company has applied to the Canadian parliament for authority to build electric railways from Hamilton to Toronto, Ont.; from Hamilton to the Niagara river and across a bridge to a point between Niagara Falls and Ft. Erie; from Brantford to Woodstock and Windsor; and to construct a ferry across the Detroit river.

Hickman, Ky.—Archer & Short, electric railway promoters, are making the preliminary arrangements for building an electric interurban road from Hickman via Union City, Fulton, Clinton and Mayfield to Paducah, Ky.

Houston Electric Company.—Manager David Daly, of Houston, has announced that the Stone & Webster Engineering Corporation has appropriated \$478,000 for extensions and improvements to be made in Houston during the present year. This work as outlined by Mr. Daly includes rebuilding many of the lines with the heaviest type of girder rail, and the reconstruction of much of the overhead work. Heavier trolley wire will be strung in some places, new feeder wires will be installed and some of the span wire construction is to be replaced by brackets. New curves, switches and special work are to be installed.

Jackson (Miss.) Railway Light & Power Company.—This company laid 7 miles of new track during 1906 and is planning to lay about two more miles the present year. 75-pound T-rails laid in rock ballast have been adopted as standard construction on this system.

Kanauga Traction Company.—This company has made surveys and has secured the right of way for its proposed line from Gallipolis, O., to Kanauga, W. Va., with branches. M. K. Duty, of Pennsboro, W. Va., is president.

Lake Superior Railway Construction Company.—This company, recently incorporated to build an electric railway from Marquette to Negaunee, Mich., has completed much of the preliminary work on the project and all the stock has been subscribed. Negotiations are now being made for terminal facilities, with the Marquette City & Presque Isle Railway and with the Negaunee & Ishpeming Railway. The city council of Marquette has been requested to appoint a committee to confer with the company in regard to a franchise.

Leroy & Southwestern Railroad.—It is reported that the Southern Construction Company and the Merchants' Bank, of Jackson, Miss., have purchased the entire issue of \$400,000 bonds of this road and will immediately begin the construction of 35 miles of road, between Bloomington and Leroy, Ill. Strang gasoline electric motor cars are to be used and the road is to handle both freight and passengers. A. H. Shelby, president, Bloomington, Ill.

Nauvoo, Ill.—Buffalo capitalists are reported to have made a proposition to build an electric line from Nauvoo to Niota, Ill., if the city will furnish the right of way on the streets, ground for a power house and car barns, and an electric lighting franchise.

Omaha & Council Bluffs Street Railway.—Vice-president G. W. Wattles has announced that it has been definitely decided to build a line from Omaha to the Iowa School for the Deaf. Some of the material has been ordered and work is to begin as soon as the weather will permit. It has also been decided to build an interurban line, the route of which has not yet been given out.

Omaha Lincoln & Beatrice Railway.—Construction material is being shipped for the tracklaying on the line between South Omaha and Sarpy Mills, Neb., which was graded last fall, and it is stated that work will begin about February 1. E. C. Hurd, general manager, Lincoln, Neb.

Richmond & Chesapeake Bay Railway.—This company, which is building from Ashland to Richmond, Va., has nearly completed the reinforced concrete viaduct over which the tracks will enter the city of Richmond. The viaduct when completed will be 2,810 feet long, and will run from Shedd street across Bacon and Oak streets, thence across the Seaboard Air Line Railway over to Moore street, and thence crossing respectively Williams, Leigh, Catherine, Clay and Marshall streets, and terminating about the middle of the block between Marshall and Broad. The height of the bridge at the Seaboard Air Line crossing and over the Bacon Quarter Branch will be about 67 feet. The greatest clear span will be 67 feet 4 inches. John T. Wilson has the contract and the work is about 95 per cent completed. Frank J. Gould, of New York, is president. C. P. E. Burgwyn, of Richmond, chief engineer.

Richmond, Ind.—A number of prominent capitalists from Hamilton, O., together with several local men, held a conference on January 18 for the purpose of perfecting plans for building a traction road from Richmond to Hamilton, where connections will be made for service through to Cincinnati.

San Bernardino Valley Traction Company.—This company has secured the right of way and completed surveys for an extension from Colton to Riverside, Cal., 7 miles. A. C. Denman, Jr., of San Bernardino, Cal., is president and general manager.

Sandusky Norwalk & Mansfield Electric Railway.—Tracklaying between Plymouth and Shelby, O., was completed on January 19, thus completing the line from Norwalk to Mansfield. The first section of the line, from Norwalk to Plymouth, was put in operation last year. This line makes a through connection from Cleveland to Bucyrus, as it joins the Lake Shore Electric Railway and the Ohio Central Traction Company. As soon as crossings over the Baltimore & Ohio and Cleveland Cincinnati & Chicago & St. Louis tracks are put in and the remainder of the wires strung the line will be ready for operation. S. S. Burtsfield, of Toledo, is president and general manager.

San Francisco & Napa Valley Railway.—L. J. Perry, vice-president and general manager, Napa, Cal., writes that grading is in progress from Napa to St. Helena, Cal., 18 miles, with 12 miles completed, from Napa to Oakville. The route is entirely in Napa county and includes Yountville, Oakville, and Rutherford. Surveys have been made for an extension from St. Helena to Calistoga, 9 miles. The power house and substations are completed. The equipment is of the Westinghouse single-phase type. The over-head construction is of the catenary type. W. F. Botsford, president, Los Angeles, Cal., C. H. Wallace, chief engineer, Napa, Cal.

Southwest Missouri Railroad.—This company has filed with the county clerk at Carthage, Mo., plats and profiles for two extensions, from Duenweg to Joplin and from Villa Heights to Joplin. The line from Duenweg will complete a loop through Joplin, Webb City, Duenweg and Carterville. A. H. Rogers, president, Webb City, Mo.

Spokane & Inland Empire Railroad.—This company has placed an order with the Carnegie Steel Company for 7,000 tons of 60

and 70-pound rails to be used during the year for several extensions of the system, including the extension of the Spokane & Inland Railway from Palouse, Wash., to Moscow, Idaho, 16 miles, an extension of the Coeur d'Alene & Spokane Railway to Liberty Lake, Idaho, 2 miles, and possibly from Hayden Lake to Lake Pend d'Oreille, Idaho. It is also proposed to build a new line from Spokane south to the Nine Mile bridge if a pending franchise for a subway through the business district of Spokane is secured. Material for the completion of the Spokane & Inland Railway from Waverly to Colfax and Palouse, Wash., is being delivered on a former contract as the work progresses. Grant & Smith, of Spokane, has the contract. Jay P. Graves, president; A. M. Lupfer, chief engineer, both of Spokane.

Stranger Valley Electric Railway.—W. Laming and others, of Tonganoxie, Kan., are working on a project to build an electric railway from Kansas City to Topeka, via Tonganoxie and Lawrence. Surveys have been completed and much of the right of way has been purchased.

Toledo & Chicago Interurban Railway.—This company has begun condemnation proceedings to obtain the right of way for 9 miles of its proposed line from Auburn to Waterloo, Ind.

Tri-City Railway & Light Company.—General Manager J. F. Lardner, of Davenport, announces that the company intends to continue its plans for the rebuilding of the system, begun last year, for which J. G. White & Co. has the contract, until there is not a foot of old rail in either Rock Island or Moline. Right of way is now being secured under the title of the Moline Rock Island & Eastern Traction Company, a subsidiary organization, for an interurban line which will run from Silvis through Moline and Rock Island to a point in Mercer county 12 miles south of Milan. The exact objective point is not announced but it is promised to have 12 miles completed and in operation within 12 months from the time the essential rights are obtained.

Union Traction Company.—An official report from President D. H. Siggins, of Coffeyville, Kan., states that grading has been completed from Coffeyville to Independence, Kan., 20 miles, and that a line is being surveyed from Coffeyville to Cherryvale, 30 miles.

Utica, N. Y.—Henry J. Coggeshall is president of a company organized for the purpose of building an electric road from Clinton to Waterville, N. Y., and from Deansboro to Hamilton, via Oriskany Falls. The headquarters will be at Utica.

Vicksburg (Miss.) Railway & Light Company.—This company is rebuilding 4,000 feet of city track where paving is in progress. During the past year the company has built a two-mile extension to the National Military Park.

Waco, Tex.—It is stated that nearly all of the right of way has been secured for the proposed electric railway from Waco to Marlin and Temple, Tex., and that an engineer will arrive in a short time to begin the surveys. It is estimated that the line will cost \$1,000,000. Cleveland, O., capitalists are said to be backing the project.

POWER HOUSES AND SUBSTATIONS.

Fitchburg & Leominster Street Railway.—This company has recently equipped a new power plant at Mitchellville, Mass., as an auxiliary to the main power house at Fitchburg. At present the capacity of the auxiliary plant is 150 horsepower, but new machinery will be added to bring it up to 500 horsepower. W. W. Sargent, general manager, Fitchburg, Mass.

Gulfport & Mississippi Coast Traction Company.—This company is soon to install another turbine unit in its power house at Gulfport, Miss. The plant now has two 500-kilowatt Parsons turbines to care for the railway and power load but these are not of sufficient capacity to care for the rapidly increasing demand that is being made by commercial and lighting interests. The new unit is to be of 1,000 or 1,500 kilowatt capacity. The company is operating the street railway and lighting plant of the Gulfport Development Company and is constructing an interurban line from Biloxi via Gulfport and Pass Christian, 32 miles. The section from Gulfport to Beauvoir has been in operation for some time. F. B. McCutcheon, of Gulfport, chief engineer.

Houston Electric Company.—Manager David Daly has announced that \$75,000 has been appropriated for the installation of a new engine, generator, condenser and a 1,300-foot eight-inch artesian well at the power house in Houston. The unit will consist of a most recent type of the Crocker-Wheeler generator, direct connected to a Hamilton-Corliss engine. This installation will nearly double the capacity of the present street railway power station. The generator has already been shipped to Houston and the engine and miscellaneous equipment are expected to arrive early in February. In connection with the installation of the new generator, orders have been placed with the General Electric Company for several new switch panels which are to carry out the plans of the company in conjunction with the rearrangement and extensions to the feeder system. This will enable the power for the operation of the cars to be controlled and maintained in the most efficient manner. Bids are being received from local contractors for the installation of the artesian well, and within the next two weeks the contract will be awarded and work will commence on this eight-inch well. This well is to be driven to the 1,300-foot strata, at which depth the most satisfactory water for boiler purposes is obtained, and it is expected that a capacity of at least 250,000 gallons a day will be available.

Personal Mention

Mr. Harry Wherland has resigned as superintendent of transportation of the Spokane Traction Company, Spokane, Wash.

Mr. James T. Hutchings, superintendent of the electrical department of the Rochester, N. Y., Railway & Light Company, has been appointed assistant general manager.

Mr. J. E. Sewell has resigned as general manager of the Connecticut Railway & Lighting Company, of Waterbury, Conn., which was recently acquired by the Consolidated Railway.

Mr. R. W. Brown has been appointed superintendent of the Adrian Street Railway Company and agent for the Toledo & Western Railroad, with headquarters at Adrian, Mich., effective on February 1.

Mr. Harry G. Ault has been appointed soliciting passenger and freight agent of the Indiana Columbus & Eastern Traction Company, with headquarters at Columbus, O., with jurisdiction over the Columbus, Columbus & Springfield and Grove City divisions.

Mr. Walter P. Read, who recently resigned as superintendent of railway service of the Utah Light & Railway Company after 17 years' service, was presented, on January 15, with a silver loving-cup as a token of esteem from his former associates, the employes of the company.

Mr. Arthur B. Smith, who was recently appointed traffic manager of the Consolidated Railway Company, which controls the electric lines of the New York New Haven & Hartford Railroad, was born in Boston, Mass. He received his education in New England. He entered railway service with the Chicago Burlington & Quincy Railway, at Omaha, Neb., and continued in the service of that company for 21 years, nine years in the engineering and maintenance of way departments and 12 years in the traffic department. In 1904 Mr. Smith became connected with the Yellowstone Park Association and a few months later entered the traffic department of the Northern Pacific Railway at St. Paul, Minn., as assistant general passenger agent, which position he has held up to the present time. His appointment in charge of the traffic of the Consolidated Railway becomes effective on February 1, after which date he will have headquarters in New Haven, Conn. The lines of which Mr. Smith takes charge embrace about 1,800 miles in southern New England and have an earning capacity of between \$16,000,000 and \$17,000,000 per annum, which is susceptible of considerable expansion.

A. B. Smith.

Mr. John H. Crawford, formerly superintendent and purchasing agent of the Groton & Stonington Street Railroad Company, Mystic, Conn., has been appointed superintendent of transportation for all the lines of the Ft. Wayne & Wabash Valley Traction Company, with headquarters at Ft. Wayne, Ind., succeeding Mr. C. F. Shelton, resigned.

Mr. J. A. Barry informs us that the announcement of his election as president of the Jamestown Chautauqua & Lake Erie Railway Company of Jamestown, N. Y., to succeed Mr. Frank L. Chase, as published in the Review for January 12, was an error. Mr. Joseph H. Mayer, of New York, was elected president. Mr. Barry is local manager at Jamestown.

Mr. W. H. Forse, assistant treasurer of the Indiana Union Traction Company, Anderson, Ind., has been appointed chairman of the Committee on Interurban Accounts of the American Street and Interurban Railway Accountants' Association. The other members of the committee are Mr. A. B. Bierck, auditor of the Long Island Railroad, New York, N. Y., and Mr. A. C. Henry, auditor of the Lake Shore Electric Railway, Norwalk, O.

Mr. Carl Alden Sylvester has been appointed assistant general manager of the Lexington & Boston Street Railway, Newton Street Railway, Norumbega Park Company, Newton & Boston Street Railway, Natick & Cochituate Street Railway and the Westboro & Hopkinton Street Railway, all controlled by the Boston Suburban Electric Companies, with headquarters at Newtonville, Mass. Mr. Sylvester has been heretofore assistant to Mr. M. C. Brush, vice-president and general manager of these companies.

Mr. M. R. Dickey has been appointed auditor of the Toledo & Western Railroad Company, effective February 1, succeeding Mr. C. E. French, resigned. Other recent appointments are as follows: Mr. T. V. Franklin, purchasing and freight claim agent and chief clerk to the president, Mr. A. L. Bennett, trainmaster,

Mr. R. L. Harrison, superintendent of telegraph and chief dispatcher. The jurisdiction of Mr. Ira P. Schofield, superintendent of motive power and equipment, and J. S. Delter, roadmaster, has been extended over the lines of the Adrian Street Railway Company; all with headquarters at Sylvania, O.

Mr. Theodore Perry Shonts, president of the Isthmian Canal Commission, in charge of the Panama Canal construction, and president of the Toledo St. Louis & Western Railroad, has been elected president of the Interborough-Metropolitan Company, of New York, N. Y., succeeding Mr. August Belmont. The Interborough-Metropolitan controls the New York City Railway and the Interborough Rapid Transit Company, and through them practically all of the subway, elevated and surface street railway lines in New York City. Mr. Belmont will remain as chairman of the board of directors of the various subsidiary companies composing the system. Mr. John B. McDonald has been elected vice-president and superintendent of construction of the Interborough-Metropolitan and Mr. E. P. Bryan, vice-president of the Interborough Rapid Transit Company, has been elected president of that company, in place of Mr. Belmont. Mr. Shonts' resignation as president of the canal commission has been accepted by President Roosevelt, to become effective on March 4, and he will not assume the active duties of his new office until that time. He was born in Crawford county, Pa., in 1856, and graduated from Monmouth College in 1876 with the degree of B. A. In 1879 he received the degree of M. A. from the same college. He entered railway service in July, 1881, as superintendent of the Iowa Construction Company and from May, 1882, to January, 1902, he was connected with the Indiana Illinois & Iowa Railroad, successively as general superintendent, general manager and president and general manager. On January 15, 1904, he was elected president and general manager of the Toledo St. Louis & Western and since April, 1905, he has been also president of the Isthmian Canal Commission and president of the Panama Railroad.

Financial News

Cleveland & Southwestern Traction Company.—The annual meeting was held on January 15. President F. T. Pomeroy, in his annual report to the stockholders, submitted figures showing that the gross receipts of the company for the calendar year were \$645,849, an increase over 1905 of \$102,623. Net earnings were \$363,856, a gain of \$53,020. During the year the company purchased 15 new cars which, including the 15 purchased the year before, made a total new investment in rolling stock of \$225,000. The stockholders re-elected former directors, and voted approval of the acts of directors in important steps recently taken for the enlargement of the system.

Cleveland Southwestern & Columbus Railway.—The directors of the Cleveland & Southwestern Traction Company, who are working out the details for a consolidation of that company with the Cleveland Ashland & Mansfield Traction Company and the Ohio Central Traction Company, have decided on the above name for the merger company, which indicates the intention of extending ultimately to Columbus, either by building new lines or acquiring existing roads. The three lines to be merged, which are owned by the same interests, form a continuous line from Cleveland via Ashland, Mansfield and Galion to Bucyrus. The capital stock of the new company will be \$10,000,000, with a bond issue of \$10,000,000.

Indianapolis Columbus & Southern Traction Company.—At the recent annual meeting the officers and directors were all re-elected.

Louisville & Eastern Railroad.—At the recent annual meeting two new directors were elected, James Lippincott, of Philadelphia, and Davis Brown, of Louisville. The other directors and the officers were all re-elected. It was announced that the extension from Louisville to Lagrange, Ky., should be completed in a month and the line to Shelbyville in October or November. Percival Moore, of Louisville, is president.

Northern Indiana Railway.—It is stated that the deal was completed in New York last week whereby this company has been transferred to the Dietrich syndicate, of New York, the Murdock brothers of Lafayette, Ind., Ex-governor Durbin of Indiana and Hugh J. McGowan, of Indianapolis. The price is said to have been \$1,000,000. The Northern Indiana Railway runs from Goshen, through Elkhart and South Bend to Hudson lake, and from Laporte, to Michigan City. It is said to be the intention of the new owners to build a line direct from South Bend to Chicago by way of Michigan City. In addition, the local systems in the cities through which the line is to be built will be reconstructed and put in first-class condition.

Northern Ohio Traction & Light Company.—The annual meeting was held at Akron, O., on January 13. The officers and directors were all re-elected. The report of President Everett gave a detailed statement of the transaction whereby the company purchased the Canton-Akron Railway, the Canton-New Philadelphia Railway and the Tuscarawas Traction Company from the Tucker Anthony syndicate of Boston. This added 97.41 miles of track to the system, making the total mileage at the close of the year 294.12 miles, which is exclusive of the Wadsworth extension not yet completed, which will amount to six miles. This will be completed by the first of March. At the close of the year the com-

pany was absolutely free of debt. The annual report for the calendar year, 1906, as compared with the previous year, is as follows:

	1905	1906	Increase
Gross receipts	\$1,560,047.11	\$1,703,399.98	\$143,352.87
Operating expenses	900,718.93	1,006,802.31	106,123.38
Net earnings	659,328.18	696,597.67	37,229.49
Interest		483,173.85	
Surplus		213,423.82	

Rochester & Eastern Rapid Railway.—At the annual meeting in New York last week it was decided to remove the auditing and accounting offices from Canandaigua to Rochester, N. Y. The officers elected were as follows: President, Horace E. Andrews; vice-president, W. K. Vanderbilt, Jr.; secretary, J. C. Collins; assistant secretary and auditor, A. L. Linn, Jr.; treasurer, E. L. Rossiter; assistant treasurer, C. A. Tucker.

Rochester Railway.—At the annual meeting in Rochester last week John J. Stanley, and W. N. Kernan were elected directors in place of C. J. Bissell, and A. G. Hodenpyle. Officers were elected as follows: President, Horace E. Andrews; vice-presidents, William K. Vanderbilt, Jr., John J. Stanley, R. E. Danforth; secretary and auditor, J. C. Collins; treasurer, E. L. Rossiter; assistant treasurer, C. A. Tucker; assistant secretary and general auditor, A. L. Linn, Jr.; general manager R. E. Danforth. The company is controlled by the Rochester Railway & Light Company.

Rochester Railway & Light Company.—At the annual meeting of the stockholders at Rochester, N. Y., last week Charles T. Chapin was elected a director in place of H. D. Walbridge. The other directors were re-elected. The directors elected the following officers: President, Horace E. Andrews, Cleveland, O.; vice-presidents, G. A. Hollister and W. K. Vanderbilt, Jr.; secretary and auditor, J. C. Collins, Rochester; treasurer, E. L. Rossiter; assistant treasurer, C. A. Tucker; general auditor and assistant secretary, A. L. Linn, Jr.; general manager, R. M. Searle; assistant general manager, James T. Hutchings; members of executive committee, John Carstensen, W. C. Brown, G. A. Hollister, W. K. Vanderbilt, Jr., and John J. Stanley. The company is controlled by the Mohawk Valley Company, of New York.

Toledo & Western Railway.—This company which was recently purchased by a syndicate headed by J. R. Nutt, of Cleveland, has been refinanced. The capital stock has been authorized at \$2,000,000 and the bonds at \$2,000,000. Of these bonds \$1,250,000 are a first mortgage on the original Toledo & Western property. Another \$250,000 are a first mortgage on the Toledo Fayette & Western division. The remaining \$500,000 are a second mortgage on the combined properties. This last mortgage was originally authorized for \$2,500,000, of which \$1,500,000 were held in escrow for the underlying bonds, \$500,000 set aside for improvements and to pay floating debt and \$500,000 were to remain for future improvements. This mortgage, however, has been closed, and bonds to the extent of \$500,000 cancelled. No more bonds can therefore be issued under the present mortgage. The company has about 78 miles of track on a private right of way and the balance of the system is operated under franchises, either for thirty years or with no time limit whatever. The floating debt will be paid with the proceeds of the \$500,000 second mortgage bonds mentioned in the foregoing, leaving the \$2,000,000 stock in the hands of the Nutt syndicate. C. F. Franklin, Sylvania, O., president.

Toledo Railways & Light Company.—The annual meeting of the Toledo Railways & Light Company was held at Toledo on January 17 and the directors and officers were all re-elected. The stockholders authorized the lease of the Toledo Ottawa Beach & Northern Railway, which extends from the Casino to Ottawa Beach, and which will be operated as a part of the Rail-Light system. The annual report submitted to the stockholders by President Henry A. Everett shows that the gross receipts of the company for the year 1906 were \$2,047,610.75, being an increase over 1905 of \$134,154.69. The operating expenses were \$1,071,733.33, 52.34 per cent. Interest charges on funded and floating debt were \$509,607.12, leaving a net income of \$466,230.30, 3.89 per cent on the capital stock of the company. The following comparative statement of gross earnings of the properties now owned by the Toledo Railways & Light Company for the years 1897 to 1906, inclusive, shows not only the wonderful growth of street traffic in Toledo, but is a fair index of the growth of the city itself:

	Gross earnings.	Per cent increase.
1897	\$ 897,361.06	
1898	968,516.59	7.93
1899	1,069,279.88	10.40
1900	1,182,516.83	10.59
1901	1,311,084.25	10.88
1902	1,459,091.39	11.29
1903	1,663,794.03	14.03
1904	1,752,833.67	5.35
1905	1,913,456.06	9.17
1906	2,047,610.75	7.01

The bonded indebtedness of the company is now \$10,866,000. During 1906 there was operated 107.64 miles of track, earning \$1,536,524.64, being earnings per mile of track, \$14,274.66.

United Traction Company (Albany, N. Y.)—This company has purchased the Forest Park Railway, of Troy, N. Y., which was building a 2-mile road from Troy to Forest Park cemetery, and will complete the construction of the line. E. S. Fassett, general manager, Albany.

Manufactures and Supplies

ROLLING STOCK.

Rockford & Interurban Railway, Rockford, Ill., is building two interurban cars in its own shops.

Cincinnati Milford & Loveland Traction, Cincinnati, O., is getting prices on one new equipment.

Western Ohio Railway, Lima, O., expects to place an order next week for 10 or 12 interurban cars.

Worcester Consolidated Street Railway, Worcester, Mass., is in the market for 25 new equipments.

East St. Louis & Suburban Railway, East St. Louis, Ill., has placed an order with the Inter-State Car Company for 200 wooden coal cars of 80,000 pounds capacity.

Ferrocarriles del Distrito Federal, Mexico City, Mex., operated by the Mexico Electric Tramways, Ltd., has ordered 25 double truck cars from the St. Louis Car Company.

Southern Light & Traction Company, Natchez, Miss., will purchase three or four cars during the coming summer. The specifications for the cars have not yet been approved.

Detroit United Railway, Detroit, Mich., has placed an order with the Cincinnati Car Company for 50 large double-truck cars for city service and 10 interurban cars.

Oklahoma City Railway Company, Oklahoma City, Okla., is reported to be building seven new cars at its own shops, four of which are for interurban service and three for city service.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., is having 10 cars built by the St. Louis Car Company. These cars will have a steel floor plate and underframe reinforced with steel.

Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind., has recently placed an order with the Cincinnati Car Company for six semi-convertible cars to be used on the city lines in LaFayette, Ind.

West Chester Street Railway, Philadelphia, has placed an order with the J. G. Brill Company for three 50-foot double-truck compartment cars of the semi-convertible type, each having four G. E. motors of 40 horsepower.

Chicago & Milwaukee Electric Railway, Chicago, has placed an order with the Jewett Car Company for 20 interurban cars, 10 of which are for May and 10 for September delivery. These are duplicates of cars now in use on this line.

Memphis Street Railway, Memphis, Tenn., was reported in the Electric Railway Review of January 19 as soon to order 25 new cars for early delivery. We are informed that these will be 42-foot cars with bodies 30 feet long, full vestibuled and equipped with airbrakes and four-motor equipments.

Citizens' Railway Company, Lincoln, Neb., was reported in our columns last week as about to order six new cars. We are informed that an order has been placed for eight single-truck, full-convertible cars of the Brill patented type, with 20-foot bodies, vestibuled, mounted on 21 E Brill trucks and equipped with G E 54 motors and K 10 controllers.

Peoria Railway, Peoria, Ill., has ordered 15 cars from the American Car Company for city service. These cars are to be 43 feet long, equipped with airbrakes, electric heaters, pilot, interior finish of cherry and mahogany, rattan seats, and are for delivery on June 1. A lining throughout with steel as a safeguard in case of accident is a special feature of these cars.

Spokane Traction Company, Spokane, Wash., was reported in the Electric Railway Review of January 19 as having ordered ten cars. This order has been increased to 15 cars to be built by the St. Louis Car Company, all of which are for March delivery. They are of the Detroit type, 41 feet in length, will have a seating capacity for 125 persons, and will be equipped with four motors of 40 horsepower each.

Terre Haute Traction & Light Company has placed an order for 8 interurban cars with the Jewett Car Company. The specifications include the following:

Seating capacity	60 persons	Height—	
Weight	70,000 lbs.	Inside	7 ft. 7 1/4 in.
Length, over vestibule	50 ft.	Sill to trolley base	8 ft. 5 1/2 in.
Over all	51 ft. 6 in.	Track to trolley base	12 ft. 6 in.
Width, over all	8 ft. 5 in.	Body	Wood

Special Equipment.

Airbrakes	Westinghouse	Journal boxes	Symington
Center bearings	Symington	Markers	Lintern
Control system	G. E. multiple unit	Motors, type and number	G. E. 73-4
Destination signs	Van Dorn	Paint	Paint. Green body, white upper
Fenders	Hunter	Sanders	Nichols-Lintern air
Gongs	Pilots	Heywood Bros. & Wakefield	Trolley poles and attachments
Heating system	Multiple stroke	Wilson retrievers	
Headlights	Hot water	Trucks	Baldwin
Interior finish	Crouse-Hinds		
	Natural oak		

Norfolk & Portsmouth Traction Company has ordered twenty double-track motor passenger cars, one double-track motor passenger and baggage car, two closed trallers, six, 14-bench open trail cars and one freight motor, of the J. G. Brill Company, for

the Norfolk Railway division and twenty 14-bench open trail cars, all having double trucks, of the J. G. Brill Company, for the use of the Norfolk & Atlantic Terminal Company.

Gulfport & Mississippi Coast Traction Company, Biloxi, Miss., will purchase four or five cars at an early date. It is proposed to build two single-truck cars for use on the city lines at Gulfport and the balance will be double-truck cars for interurban service.

Eastern Wisconsin Railway & Light Company, Fond du Lac, Wis., has placed an order with the Cincinnati Car Company for three 40-foot cars. They are of the semi-convertible type, can be used for either city or interurban service, being geared for 40 miles an hour. They will be equipped with quadruple Westinghouse 101 B motors, K 28 controllers, Brill 27 G trucks, Peacock brakes, Root scrapers and will be heated by hot water.

SHOPS AND BUILDINGS.

Anderson (S. C.) Traction Company.—This company is preparing plans for a large modern car barn and machine shop at Anderson, to cost about \$3,000, which will accommodate all of the company's cars, both city and interurban. The building will be of corrugated iron and mill construction. Work has commenced on the foundations. George E. Coughlin, of Anderson, is general manager.

Consolidated Railway.—This company has contracted for the construction of a 100 by 114-foot addition to its car house at Oxford, Mass., which will make the building 280x114 feet when completed.

Louisville & Eastern Railroad.—The directors at the recent annual meeting approved the plans for the erection of a terminal station in the central part of Louisville, Ky., and negotiations are being made for the purchase of a piece of property near Fifth and Jefferson streets. The Lagrange and Shelbyville extensions are to be completed this year and for that reason the present station at Fifth and Green streets will soon prove inadequate. Percival Moore, president and general manager, Louisville, Ky.

Mobile Light & Railroad Company.—A contract has been let to the Interstate Construction Company for the construction of a car shed at Monroe Park, Mobile, Ala. The building will be of reinforced concrete, 225 by 47 feet. A contract has also been awarded for a frame car barn with cement floor at the southern end of Monroe Park, to S. E. Dupree & Co. This will be 176 by 46 feet.

Walla Walla Valley Traction Company.—This company has commenced the construction of a brick car house and machine shops at Walla Walla, Wash., which will cost in the neighborhood of \$7,500 and will accommodate from 8 to 10 cars.

TRADE NOTES.

Standard Underground Cable Company, Pittsburg, Pa., has recently opened branch offices at Atlanta, Ga., and Seattle, Wash.

Falkenau Electrical Construction Company, Chicago, has been incorporated with a capital of \$20,000. The incorporators are: Victor Falkenau, W. A. Burroughs, and H. A. Strauss.

Pneumatic Machine Manufacturing Company has been incorporated in New Jersey with a capital of \$200,000, for the purpose of manufacturing pneumatic tools of various kinds. The incorporators are New York people.

Crane Company, Chicago, announces that it now has its new steel foundry in full working order. The company will make a specialty in this department of steel valves and fittings and these additional facilities are such that orders can be filled promptly.

R. Woodman Manufacturing & Supply Company, Boston, reports a very busy season. It has become necessary to work a night force of men in order to keep up with the increasing demand for its goods. Money orders are being received from foreign countries.

S. J. Collins has accepted a position with the Rail Joint Company of New York and Chicago. Mr. Collins was formerly with the Quincy, Manchester, Sargent Company, Chicago, prior to which time he was general superintendent of the eastern division of the Southern Railway.

Massachusetts Chemical Company, of Walpole, Mass., reports an unprecedented success for its No. 280 Dryfield cable tape during the last year. There is a great demand for this tape for street railway coils, and it is used in large quantities by manufacturers of cable and insulated wire. Increasing demands are reported for No. 50 insulating compound, which is a new permanent plastic armature and field coil varnish.

Colonel John T. Dickinson, who for the past several years has been connected with the Consolidated Railway Electric Lighting & Equipment Company, has tendered his resignation and accepted the position of vice-president of the Bilas Electric Car Lighting Company of Milwaukee. Colonel Dickinson's headquarters will be in New York at the new offices of the Bilas Electric Car Lighting Company in the Night & Day Bank Building, Fifth avenue and Forty-fourth street, opposite Sherry's and Delmonico's. The Chicago offices of the Bilas Electric Car Lighting Company will be in the Monadnock Building, and Mr. W. M. Lator, who was formerly also with the Consolidated Railway Electric Lighting & Equipment Company, will be in charge of the Chicago office as assistant general sales manager. The extensive additions to the large plant of the Bilas Electric Car Lighting Company in Milwaukee will be completed by February 1, which will afford ample

facilities for the manufacture and prompt delivery of electric car lighting and train lighting equipment batteries and supplies.

American Car & Foundry Company, St. Louis, has appointed Joseph G. Johnston district manager at Detroit, Mich., and Patrick H. Sullivan assistant district manager to succeed Wesley R. Mason, who was recently appointed general manager of the Dominion Car & Foundry Company with headquarters at Montreal. Both Mr. Johnston and Mr. Sullivan have been in the employ of the company for over 20 years, Mr. Johnston being promoted from the office of superintendent and Mr. Sullivan from lumber inspector.

Charles N. Wood Company, 79 Milk street, Boston, Mass., the eastern representative of the International Register Company, reports that it has just delivered a complete equipment of badges for motormen and conductors of the Boston Elevated Railway. These are the well-known Heeren badges and are much larger in size than those formerly worn by these employees. The railway company wished to have a badge large enough so that all the passengers could see it at a distance. The badge of the motorman is made with a black ground and white letters; the conductor's has a white background with black letters. These badges were so conspicuous that the Boston Herald devoted a half column of its paper to complimenting the railway company on the change.

S. F. Bowser & Company, Incorporated, Fort Wayne, Ind., owing to a large increase in its business during the year 1906, a business which it states was 75 per cent greater than 1905 and three times larger than 1904, has found it necessary to open a branch office at 299 Broadway, New York City. This office will be in charge of W. T. Hatmaker, formerly manager of the mail order department of the Boston branch. The company states further that this is only one of the many additions that has been made in the past year and reports that the factory in Fort Wayne has been increased 125 per cent and the office accommodations at Fort Wayne have been quadrupled. The company has completed a new \$25,000 factory at Toronto, Can., and has added a large number of salesmen.

H. J. Lamborn has been appointed superintendent of power and plant of the Yale & Towne Manufacturing Company to succeed F. A. Waldron, who resigned about a year ago. Mr. Lamborn will have charge of all steam and electrical plants, the supervision of new buildings and the general care and repair of the plants. Mr. Lamborn is a graduate of the Towne Scientific School of the University of Pennsylvania in the course of mechanical engineering, since which time he has held various positions, which have given him a varied experience with mechanical matters. S. E. Dauchy, who has been acting superintendent of power and plant during the past year and for several years has held the position of assistant superintendent, will continue in the latter capacity under Mr. Lamborn.

Western Electric Company exhibited at its booth, at the Electrical Show at the Coliseum, Chicago, Ill., January 14-26, a very large and handsome water color painting of its new 110-acre plant at Hawthorne, Ill. This plant is equipped with modern labor-saving devices in the way of machinery for executing its work, and the general ground plans are arranged so as to minimize labor in the handling and assembling of the electrical apparatus manufactured. The exhibit included American transformers, Thomas high-tension insulators, Electros Insulating material, Western Electric Company's arc lamps and direct and alternating current motors, its series of multiple lamps for both alternating and direct current. The company makes a specialty of a direct current indestructible lamp, the magnets of which are wound with Delta-abeston magnet wire and will give a demonstration of the heat resisting qualities of this wire as compared with cotton-covered magnet wire. Another interesting feature was that of a series alternating equipment in full operation including switchboard, regulator and transformers. A new 1907 line of fan motors and a switchboard equipped with some recently perfected devices was also shown.

ADVERTISING LITERATURE.

David B. Crockett Company, Bridgeport, Conn.—This company, which is a maker of varnishes, has sent out to its friends an artistic calendar for 1907.

A. O. Schoonmaker, 221 Fulton St., New York.—A. O. Schoonmaker, who is the importer of India and Amber mica, has issued his price list of those materials for 1907.

Universal Portland Cement Company, Chicago.—This company has reprinted the second chapter of "Concrete, Plain and Reinforced," by Taylor & Thompson, and given it the title, "The Process of Concreting." The publication is handsomely bound and should be of material service to those interested in concrete work.

Sprague Electric Company, New York City, N. Y.—"The Electric Equipment of a Modern Hotel" is the title of an interesting illustrated bulletin issued by this company. The modern hotel referred to is the "Hotel Gotham" in New York and the equipment described includes that for electric light and power generation, the switch boards, electrical equipment for the laundry, for water service and for the vacuum cleaning system.

Wright Truck Company, 727 Walnut Street, Philadelphia, Pa.—A printed catalogue comprising principally engravings from working drawings showing two styles of trucks, which it is said can be constructed and repaired in an ordinary car shop without the use of costly dies or special tools. One of these is the equalizer type with rolled steel channel trunnions and sides, cast pedestals and

equalizers, springs placed apart and located adjacent to the journal boxes and spring hangers. The other is the pedestal spring type with rolled steel channel transoms and sides, cast steel pedestals with necks detachably secured upon the vertical ends of the channel side pieces and helical springs above each journal box designed to cushion the entire frame.

Cooper Hewitt Electric Company, New York.—A well-executed pamphlet, 7 by 10 inches, describes in some detail the conspicuous features of the Cooper Hewitt system of mercury vapor lamp lighting with illustrations showing its application in industrial uses.

L. S. Starrett Company, Athol, Mass.—A copy of the "Vicksburg American" containing an account of the manner in which a supposedly fool proof steel bar installed in the Warren county, Mississippi, jail was cut through in four hours by one of the company's No. 250, 12-inch hack saws.

Crouse-Hinds Company, Syracuse, N. Y.—"Just a Few Condulet Suggestions" is the title of two publications issued by this company. Both of these are constituted almost entirely of engravings from drawings illustrating the useful manner in which this company's various types of condulets may be used in wiring. The publications are not only an effective advertisement of the company's products, but contain many useful suggestions for those installing electrical equipment of all types.

Milliken Brothers (Inc.) New York.—This company is issuing a convenient handbook showing sections which its new steel mill at Milliken, S. I., is capable of rolling. The product of the plant at present consists of open-hearth I-beams, slabs, channels, angles, Z-bars, etc., and special attention is called to 18-inch channel sections, believed to be the largest channel now rolled. This section is intended specially for heavily-loaded columns and bridge chords where a large radius of gyration is essential to economy.

J. G. Brill Company, Philadelphia.—Volume 1, No. 1 of Brill's Magazine has been issued under date of January 15, 1907. It is published in the interest of J. G. Brill Company, Philadelphia; G. C. Kuhlman Car Company, Cleveland, O.; American Car Company, St. Louis; John Stephenson Company, Elizabeth, N. Y. The publication is standard size 6 by 9 inches with 24 pages replete with engravings from photographs and drawings. Various types of modern car construction are shown and described. The publication also deals with other rolling stock and rolling stock equipment.

General Electric Company, Schenectady, N. Y.—This company continues to publish its series of pamphlets descriptive of manufactures of its various departments. The recent publications of the railway department include Bulletin No. 4474 descriptive of GE-76 railway motor, which in general appearance is somewhat similar to the GE-66 box frame motor, but is more substantial in construction, has longer bearings and commutator, wearing surface for armature heads and seats for gear case lugs. The pamphlet describes the various parts in detail and presents characteristic curves. Bulletin No. 4479 describes the Toledo & Chicago interurban single-phase railway, the author of the paper being John R. Hewett.

WESTINGHOUSE 10,000-KILOWATT TURBO UNITS FOR BROOKLYN.

Electric generating units of 10,000-kw. capacity, complete in a single machine will soon be built to fulfill a contract recently executed between the Transit Development Company of Brooklyn, N. Y. and the Westinghouse Machine Company of Pittsburg. The new equipment will consist of five 10,000-kw. turbo-generator units and a large amount of converting, transforming and controlling apparatus, all to be manufactured by the Westinghouse interests.

The new unit will establish a new standard of compactness. The combined unit will measure approximately 48 feet, 6 inches in length, 15 feet in width and 12 feet 3 inches in height, above the floor level, equivalent to .075 square feet per kilowatt rated, or .049 square feet per kilowatt maximum. That a striking advance has been made within recent years toward securing greater compactness in prime movers is shown by the accompanying curves.

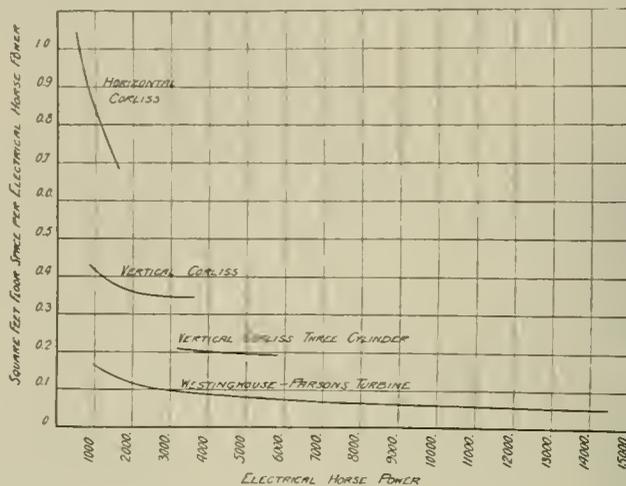

The turbine equipment is designed for a steam pressure of 175 pounds at the throttle, 100 degrees superheat and 28 inches vacuum. Under the assumed conditions of operation the units will sustain their full rated load continuously with a temperature rise of 35 degrees C. with the power factor ranging from 90 to 100 per cent. In the event of loss of vacuum, accidental or otherwise, the turbines will automatically "go to high pressure" carrying their full rated load without the assistance of a condenser. This feature will be obtained through the use of a secondary admission valve of construction similar to the primary valve and operated by the governor in such a manner as to automatically come into operation when the overload upon the machine reaches a certain point. The action of this valve is to raise the pressures in the various stages and thus increase the capacity of the machine. Speed variation may accurately be adjusted by a distant control mechanism attached to the governor and operated from the switchboard.

In the construction of the generator the standard rotating-field design will be employed with the frame entirely enclosed to facilitate forced ventilation and incidentally obviate the noise emanating from high-speed turbines. Current may be delivered at 6,600 or 11,000 volts pressure according to the method of connecting the windings.

A good feature of the horizontal-type turbine is the excellent disposition which may be made of the condensing apparatus. In spite of the compactness of these large units, the surface con-

denser will be located, as usual, directly beneath the turbines in the power house basement together with all of the condensing auxiliaries, thus giving a clear engine room floor. This arrangement likewise permits of affectively carrying out the "unit system" in power plant design which is so important in securing the best arrangement of the boiler plant.

It is significant that this new power equipment will be eventually installed in the new Kent Avenue station, Brooklyn, where two large turbine units made by the same builders and a third of another make, but similar design, have been in operation for

Horsepower—Area Curves for Prime Movers.

some time. This station then will be devoted entirely to turbine machinery.

A DISPLAY OF STORAGE BATTERIES AT THE CHICAGO ELECTRICAL SHOW.

The Electric Storage Battery Company, of Philadelphia, with a Chicago office at 1425 Marquette building, at the Chicago Electrical Show demonstrated the variety of batteries manufactured by it, ranging from a tank with a capacity of 4,800 amperes for one hour down to a cell with a capacity of 2½ amperes for one hour. All of these batteries are of the Chloride Accumulator type and include the R-73 elements in R-85 tank, 2,600 of which cells are now being installed by the New York Central & Hudson River Railroad Company in its electrification. Cells of this type will be used at the Gary, Ind., plant of the Indiana Steel Company now under construction. The G-51 tank is quite generally used by street railway companies through the country, and the other types shown were the F-21 for lighting and telephone work, both in wood tanks and in glass tanks; the F-15, E-13, D-7 and C-5, all in glass jars. The Electric Storage Battery Company also showed a number of its Exide batteries. This type of battery is used for automobile work, both for propulsion and ignition. A feature of the exhibit was the 7-33 Exide signal cell, 10,000 of which are in use on the Harriman lines.

The Electric Storage Battery Company makes a specialty of ear-lighting work and the exhibit included its two-compartment tank and a variety of accessories for railway ear lighting. In addition to the above this company exhibited its cell-filling device and its automatic-signaling hydrometer which is in operation. The company was represented by Charles Blizard, third vice-president, G. H. Atkin, manager of the Chicago office, and Messrs. J. M. S. Waring, district engineer, W. F. Bauer, W. F. Rath, H. B. Marshall, F. W. Hyde and George Neth.

ALLIS-CHALMERS COMPANY'S EXHIBIT AT THE ELECTRICAL SHOW.

The exhibit of the Allis-Chalmers Company, of Milwaukee, at Chicago's second annual electrical show, included a new 75-kw. self-contained AB alternating-current generator, a 10-hp. induction motor-generator set, a 15-hp. high-speed engine-generator unit, a line of new type K motors of 1 1/3 to 20 hp. for direct current, and six induction motors of from one to 20-hp. capacity. With the induction motors potential starters were shown for all sizes from five horsepower upward. A model showed both the movable and stationary rings of blading of a 500-kw. Allis-Chalmers steam turbine. The booth of the company was finished in the mission style and the company distributed catalogues, bulletins and other advertising matter showing electrical apparatus, steam engines, gas engines, hydraulic and steam turbines, saw mill machinery, pumping machinery, power-transmission machinery, timber-preserving machinery and other lines of machinery manufactured by it. The exhibit was in charge of C. A. Tupper and S. R. Kerr, assisted by J. W. Gardner, manager of Chicago district office of the Allis-Chalmers Company; W. S. Heger, assistant to the president; G. B. Foster, W. M. S. Miller, manager of the price department, and a number of salesmen, including Messrs. C. H. Melvey, C. S. Buell, Ervin Dryer, F. L. Webster, J. M. Denniston, E. R. Jacobs, D. K. Chadbourne, H. I. Keen, A. W. Catlin, L. St. J. Smith, P. C. Van Zandt, Geo. Voigt, L. M. Harvey, E. Timm and C. H. Howe.

A feature to be considered in the selection of a site for a power plant which is worthy of very careful study is the purity of the water. While it is not of quite the same importance to have pure water for cooling as for the boiler feed, unlimited trouble may be caused through the corrosion of condenser tubes; or if the water

contains quantities of salts and solid matter which are difficult to settle or filter out, the efficiency of the condensing surface may be seriously affected through a deposit on the water side of the tubes. For these reasons in locating a plant, the engineers should thoroughly investigate any brook or river which might seem to be a favorable location. To do this the course of the stream should be followed up a considerable distance to ascertain what manufacturing plants are located on its banks, and the nature of any refuse which they may discharge into the stream. Having become assured that the nature of all wastes emptied into the stream is harmless, it would be well to have some samples of the water analyzed as a final precaution and to determine whether it will be suitable for boiler feeding as well as for condensing purposes. Much annoyance was recently caused a railway plant because these points were neglected. The trouble in this case was the excessive priming of the boilers and marked signs of corrosion. Upon investigation these were found to be caused by large quantities of fat which were dumped into the brook by a tannery a couple of miles up stream.

As has been pointed out in a recent paper by Mr. W. R. McRae, master mechanic of the Toronto Railway, too little attention is paid to the methods of keeping shop records of repairs made to the rolling stock. As he suggests, many of the repairs now made would be avoided if detailed records of all repairs were properly kept. It is highly probable that the same cars are too often run into the shops for repairs, because of the need of a thorough overhauling. This results in frequent car shortages as well as an additional number of reserve cars needed causing a direct loss to the company through interest on a new investment and the money wasted on unnecessary temporary repairs. Another point to which attention is called is the need for a perfect adjustment of the brushes, to the

lack of which most of the troubles with the motors can be traced. The life of both the brushes and commutator is increased by proper adjustment and it will be found an advantage to stagger the brushes on alternate brush arms, thus causing the commutator to wear more evenly and avoiding the usual ridges to be found on the average commutator. To secure the accurate angular spacing desirable, Mr. McRae has designed a jig on which all the brushholders, whether new or old, are mounted and spaced before being put on the motors, and no doubt the expense and trouble of this adjustment are fully warranted by the results obtained.

In a recent discussion of taxation in Michigan, Mr. Wallace Franklin, secretary and assistant treasurer, Grand Rapids Grand Haven & Muskegon Railway Company, says: "I am willing to make the prediction that as long as the taxes on electric lines in this state remain as high as they are now not a single electric line will be built within its borders for the next four years, no matter how many are planned on paper." In amplifying his prediction, Mr. Franklin says that eastern capitalists will not pay in taxes for the privilege of developing the state from 6 to 8 per cent of the gross earnings of properties. Two years ago the company with which he is connected paid for taxes 8 per cent of its gross receipts. The property was assessed at the rate of \$12,000 per mile and the right of way was assessed separately. The following year the state tax commission reduced the assessment to \$8,000 per mile, but this year it has been raised again to \$10,000. Mr. Franklin states: "We pay more taxes on a two-rod wide strip of land running through a farm of 160 acres than the owner of the place pays on the entire farm with all his improvements included." The company devoted to taxes in December, 1906, \$1,975, which was 6.4 per cent of the gross receipts for the month. Conditions in the money market make it difficult in these times to raise capital for new enterprises at a moderate rate of interest, and communities which encourage the construction of electric railway lines will find themselves better repaid by the natural developments which follow electric railways than if they squeeze exorbitant taxes from the companies. The benefits which accrue from intelligent electric railway construction are much greater than the comparatively slight return received by overburdening

companies with taxation. Mr. Franklin has done a public service in calling the attention of his community to this situation.

SOME FUNDAMENTAL CONSIDERATIONS IN DEPRECIATION.

If an individual buys a carriage he may, as occasion requires, paint it, varnish it, re-upholster, set new tires, replace a shaft or spring, and make other repairs, but there still remains a wear for which he does not provide. In time the carriage gets beyond its usefulness and he gets rid of it and buys a new one. If an accounting record was kept and the original cost still stands upon the books the amount of the new purchase cannot be added, for then there would show more property than is possessed. The new carriage has to be provided for as an expense. If the owner has been wise, he has cut down the value shown upon the books a little each year as the property wore out, so that what was received for the old carriage would cancel the account. Then the cost of the new carriage could properly be placed on the books as an original investment. Or, perhaps the owner has done better and each year, from his income, has put in the bank, at interest, a small sum, and when the old carriage had become worn out had an amount sufficient to buy the new one. In either case he has provided for the depreciation.

What is true in a simple illustration like this is equally true of as complex a property as an electric railway. And its complexity does not exempt the electric railway from depreciation or the need of providing for it. Complexity involves the problem, but the big, basic principle is the same. There is no use to wave aside the question of depreciation; it exists and must be considered. Every day's delay makes the consideration harder. The depreciation is going on and will make itself felt; it must be provided for and the earlier, the easier. In the youth of an art consideration of this matter seems unnecessary, but, no matter what the offsetting compensations, the time comes when further postponement presages sure trouble, and, if long continued, ruin.

It is true that in the electric railway art there have been many offsetting compensations and there are today—the great advance in the cost of materials used in the art, for instance. This has tended to keep the book value at a figure somewhat near the market price, less proper depreciation allowance. The industry profits today from that fact, but it cannot continue to do so indefinitely—nor, indeed, for long—and any attempt to take advantage of it much longer must ultimately result in reorganization. Suppose prices had gone the other way! Those managers and owners who regard the discussion of depreciation as a bugbear should realize that it must come; that “a stitch in time saves nine”; that consideration at this time gives a chance to approach the practical workings gradually instead of coming to the realization of the need with a sudden jar. One need not look far in any business to find instances where the awakening came too late, with the result of bankruptcy, reorganization, or “scaling down,” none of them pleasant occurrences.

To know whether or not net depreciation (that is, with appreciation allowed for) has occurred to require accounting, an accurate, impartial appraisal of the property is needed. If the total footing of this equals the total footing of the investment accounts, then depreciation has been offset and only the future need be provided for. So far as the appraisal value falls below the investment accounts the past management has erred and the future management should bear this burden in addition to its own.

Fundamentally, there are two methods of accounting for depreciation: (1) By a charge upon the earnings to provide for a liability account or a fund (asset), or by the lowering of asset accounts. (2) By charging sufficient

betterments and extensions or renewals to equal in amount the estimated depreciation. European practice in the industry preponderately favors the first method; so, for the most part, do manufacturing and general business concerns. There is excellent authority for the second, notably the American steam railways. The propriety of this so-called American theory is a new subject of investigation by the Interstate Commerce Commission.

Right here a word may be said about European methods which were discussed at some length in the *Electric Railway Review* for November, 1906. While these are enlightening and worthy of study, we are not to assume that a failure to follow foreign practice demonstrates that we are in the wrong. The method is purely incidental; the basic principle is the agreement between the value of the property as it exists and as it appears in the investment accounts. Many methods are different abroad. For instance, in English municipal undertakings the property is not considered as owned until all indebtedness is paid and, as in American town and city financing, a certain part of the debt is paid each year. However much greater the asset is than the amount outstanding against it, it cannot be further borrowed upon. It naturally follows that depreciation must be provided for under the first of the methods named.

It is this fact that caused Mr. G. W. Holford in his discussion of “Depreciation and Renewal Funds in Relation to Tramways Undertakings” (*Electric Railway Review*, November, 1906, page 906) to consider only the depreciation and renewal of permanent way, excluding rolling stock, buildings and overhead equipment on the ground that these portions of tramway equipment outlast the periods for the repayment of loans specified by the Board of Trade. In reply to an inquiry the assistant secretary (railway department) of the British Board of Trade, advises us that it is the practice of the Board to allow the following periods for the repayment of money borrowed for tramways by municipal authorities: Permanent way and buildings, 30 years; electrical equipment, 20 years; cars, 15 years.

The second method of accounting referred to may accomplish the object ultimately but not in an accurate manner. The charging of betterments or renewals to expense may be far greater in one year or term of years than the depreciation for the period would amount to, or may be far less. In either event it is unfair; in the first case it is to the detriment of the stockholders for that period, and in the second case it is in their favor.

The instant the property is in use or completed the natural deterioration commences. It is ordinarily as much the first day as on any succeeding day, but the repairs at first are little or nothing. In absolute justice to the owners or stockholders in every accounting period an amount should at once, and then at regular intervals afterwards, be set aside to represent as nearly as possible the wear and tear during that period. Then the owner at any time receives all that is justly due him and only that. The charges against income then become actual and not haphazard. A careful accountant would not charge the cost of insurance for the year into the expense of one month; he would pro-rate it over the whole year. So, for instance, track repairs—in most of the country—can be made only in a few months of the year; yet the wear is going on, proportionately to the service, as much in the months when work is suspended as when the repairs are being made.

For the ideal handling of the accounts representing assets subject to wear and tear there would be determined in advance, say each year, what the deterioration would be for the period and apportionment of it made among the months according to the amount of service or of income. Then before the end of the year these apportionments would be adjusted to approach as nearly as possible to the actual wear which had taken place. Thus the accurate expense of each

month would be as closely approximated as possible and the accountant would be relieved from explaining that "this month we made an unusual amount of repairs upon the Bee street line," etc. Accounts which are most customarily pro-rated for the monthly expense statement are those whose yearly totals are easily determined in advance (for example, insurance). It is, then, only a question of ease in determining the ultimate total, since, if the principle is good with one such account, it is with all.

So it is with depreciation. If the manager wishes to know his actual costs for any period—month, year or decade—he must know, not only the value of power used, wages and salaries paid, miscellaneous expenses incurred and interest and taxes accrued, but also, as near as may be determined, the wear and tear which has occurred. The amount expended for repairs or renewals in the period has nothing more to do with the expense for the period than the actual cash payments made for interest or taxes. Exactly as the total of the monthly—or quarterly—pro-rated amounts charged in for interest should equal the interest accrued during the year, so the account or fund provided for depreciation should equal the decrease in value that has occurred.

In practice, however, it would be more usual and, on the whole, quite as satisfactory to provide a fund or account for depreciation which would care for the heavy renewals, while the ordinary day-to-day repairs are charged directly to expense. Then it becomes a question what shall be the limit in amount to charge to repairs. This will vary in every case, since it hinges on the regularity of the expense. Charging into expense renewals of cars each year as they are bought might be practicable on a large road, while on a small road if one car for renewal were bought on an average each five years, to charge it into expense the year when bought would unduly burden the statement for that year to the great advantage of the four preceding years. This is the crux of the matter: Depreciation should be accounted for as it occurs and not when it has accumulated to the limit.

If a concern were manufacturing a marketable product, in order to determine its selling price it would compute its cost, including not only expenses, interest and taxes, but an amount for depreciation as well, and then add a reasonable measure of profit. The cost of transportation per passenger should be figured in no different way. Unfortunately, perhaps, the amount a passenger shall pay for his ride is fixed—5 cents. But if the cost of transportation, computed as explained, exceeds that figure the passenger should be willing to have his ride somewhat shortened, his transfer or other privileges somewhat curtailed, or the frequency of service somewhat reduced. If, on the other hand, such cost fall below the 5-cent unit, it is justice that the passenger should have a longer ride for his 5 cents or more frequent service or a reduced rate ticket. In either case he should allow depreciation as a part of the cost, and it is quite time that owners and managers insist that he does.

It may be urged that the passenger will not consent to this. Is not that the fault of the manager or promoter who has misled him as to the cost? And should he not be set right about the matter? Clearly, the public stands in its own light if it does not allow an ample provision for depreciation to enter into the cost of its transportation, because there comes a time when, if the public is not fair, new capital can no longer be secured to pay for renewals, and before that time arrives the service and the physical condition of the property have become so poor that patrons are not getting in exchange for their 5-cent pieces what the public in another locality, where a reasonable cost has been allowed, receives.

Depreciation is too important a factor in the cost of transportation to be ignored. If its recognition in the electric railway business is not at this moment necessary it soon will become so, and the sooner it is foreseen and provided for the more stability the investments in this industry will

have. The managers or directors or stockholders who refuse to consider this question are attempting to fool themselves—if unsuccessful, no good is accomplished—if successful, the result is disastrous.

THE COPPER MARKET.

The copper market is attracting more attention at present than that of iron or steel. The steadily advancing price, the small increase in production, the large demand and the possibility of speculative hoarding are all matters which occupy a place of unusual prominence in the market reviews and in the metal and mining trades journals. The present high price of copper with the probability of a still further advance is a matter of serious concern to the electrical industries. Production, consumption and prices of copper in the past years are not for business purposes matters of such prime importance. Supplies for the coming year at prices which are not prohibitive are questions of more immediate interest and more recent statistics do not give much encouragement.

The production of copper in the United States in 1906 was 58.6 per cent of the total production of the world. The increase for the United States was less than 5 per cent over the previous year, while the consumption increased nearly 20 per cent. In recent years Germany, Holland, France and England have taken 50 to 60 per cent of the domestic production and their demand is increasing, while the United States is now consuming more than the entire production in 1899. Imports of copper to the United States are principally from Mexico and Canada, the former sending about twice as much as the latter. The total for the two countries for 1906 was 90,000 tons. The visible supply of copper in England and France at the end of the year 1906 was 17,000 tons and at that time there were practically no unsold stocks held in America. The copper account for the United States for the year 1906 balances as follows:

	Tons.
Production	420,756
Import	102,232
Total	522,988
Less export	217,600
Balance for domestic consumption.....	305,388

Montana is the largest copper-producing state reported for 1906,—137,824 tons, which is less than that for the previous year, but the hostilities which have so long limited production in the Butte and Silver Bow districts have been settled, and it is expected that Amalgamated will produce this year 100,000 tons. Arizona now occupies the second place as a copper producing state, having increased its production in 1906 to 119,643 tons, and Michigan, which previously occupied the second place, remained nearly stationary at 100,000 tons. In the list, after these three great copper-producing states, there is a large drop to Utah which is next, that state producing in 1906 only 26,228 tons, and other producing states Tennessee, California and Idaho, still less. The only other portions of the United States which make any pretention of copper production are New Mexico and Alaska. It is expected that Utah will largely increase the production during the coming years.

The present high price of copper, 25-26 cents per pound, was attained by two sudden and spectacular advances during the last four or five months of 1905 and 1906. While the average for 1901 was 13 cents and for the first half of 1905, 15 cents, it advanced rapidly from July to December, reaching 18.9 cents and averaging for Lake copper in New York 15.73 cents in 1905. In 1906 the price did not reach 19 cents until September, when it rapidly advanced and reached 25 cents the latter part of December, the average for the year being 19 6 cents for Lake copper. While the present high

price is stimulating production it should be remembered that it did not exceed 19 cents until late last year and it will require a year or two before the capacity of the mines and smelters can so be increased as to make a substantial impression or protection. The scarcity of labor and material is a serious obstacle in making these improvements and in fact it is now preventing much gain in the operation of present plants.

A general review of the situation would indicate that there is no relief in sight if business in general continues to prosper and some of the leading authorities in the copper trade express the belief that the average price of copper this year will not be less than 25 cents.

Complaints are made that there is a combination to maintain high prices by storing away large quantities of copper, but no definite statement as to the name of any company operating in this way has been made. It is more probable that the working of the ordinary law of supply and demand will be sufficient to maintain high prices. Both Lake and Electrolytic copper are now being sold for delivery as far ahead as May and June at 25 cents and producers are refusing to make contracts further ahead than four or five months. The result of this is that manufacturers who use large quantities of copper are unable to make contracts for machinery for delivery late in the year as they are unwilling to take chances on the price of copper and are unable to find copper producers who will sell for August and September delivery.

INTERSTATE COMMERCE COMMISSION INQUIRY INTO RAILWAY ACCOUNTING.

The Interstate Commerce Commission has taken up the consideration of the accounting methods of the steam railways in regard to depreciation, renewals and betterments. In its Circular No. 5, Accounting Series, dated January 15, 1907, a comprehensive inquiry is outlined, the circular being in part as follows:

1. This branch of accounting calls in question the use made, or which should be made, of the following terms:

Transportation cost.
Repairs.
Renewals.
Replacements.
Betterments.
Improvements.
Additions.
Construction.

(a) Which of the above-named terms are used in the records and accounts of your company? If other terms are used, name them. The purpose of this question is to obtain an exhaustive list of the terms employed by the carriers in their treatment of such expenses or expenditures as make their appearance along the border line between operating accounts and capital accounts, and to determine the nature of expenses or expenditures charged to those accounts.

(b) Define the terms employed by you in the accounts of your company, so as to make clear the manner in which they are used. The purpose of this inquiry is to learn what current practice is respecting this branch of accounting.

(c) State what terms, in your opinion, should be used in an authorized system of accounting, and what meaning should be attached to each. The purpose of this request is to secure from each accounting officer a comprehensive and analytic statement relative to this branch of accounting.

2. In general, it may be said that current practice allows for depreciation by including "renewals" or "replacements" in operating expenses, and, consequently, railways do not keep a formal depreciation account. It is at least open to question whether or not this is an appropriate method of procedure, and, as will be observed from the opening paragraph of this circular, its abandonment is suggested. For the purpose of collecting information necessary for a satisfactory conclusion upon this point the following inquiries are submitted:

(a) Do you keep a formal depreciation account of any kind or of any sort, or do you place exclusive reliance upon charging renewals and replacements to operating expenses in order to maintain the integrity of your property account? If a depreciation fund is kept, explain in detail the accounting

procedure respecting it and the basis for computing the amount assigned to the fund.

(b) In case a formal depreciation fund is not kept, do you, in practice, make any use of the theory of depreciation in assigning sums from time to time for particular purposes? If so, explain your practice in this regard, especial care being taken to indicate the class of property for which renewal funds are kept, and the rules or methods followed in computing the amounts to be assigned to such special funds.

(c) You are also requested to consider this general question of depreciation accounts, and to state your reasons either for or against the continuance of the present practice of providing for depreciation. In case your views are, in general, favorable to the continuance of the present practice, while at the same time special applications of a depreciation account appears to you tenable, state in detail the kinds of property which would be affected thereby.

MASSACHUSETTS RAILROAD COMMISSION REPORT.

The thirty-eighth annual advance report of the Massachusetts Railroad Commission was submitted to the legislature on January 17. Returns were received from 90 street railway companies, but on account of consolidations there were at the end of the year, September 30, 1906, 86 existing companies. During the past year 10,228 miles of line and 14,682 miles of second track were added, making 24.91 additional miles of main track. There were also added 2,004 miles of side track. The Massachusetts companies now own 2,230.02 miles of street railway line, 420,124 miles of second track, and 153,478 miles of side track, making 2,803,622 miles of single track. Of this mileage, 19,526 miles are located in Rhode Island. The total miles of main track operated are 2,736,052,—an increase of 67,551 miles over the previous year. All the track operated is located in the state except 52,954 miles located in Rhode Island and New Hampshire.

The gross assets of the companies, on September 30, 1906, were \$156,478,140.97,—an increase of \$4,735,908 over the preceding year. The gross liabilities, exclusive of sinking and other special funds, were \$149,672,263.44,—an increase of \$4,069,021. The aggregate surplus, including premium on sales of stocks and bonds, and sinking and other special funds, was \$6,805,878, the percentage of surplus to capital being 9.56. The aggregate stock of the 90 companies was \$71,216,925 on September 30, last—a net increase of \$889,940 over the preceding year. The total amount of dividends declared last year was \$3,554,073,—an increase of \$379,568 over the preceding year. Out of the 90 companies, 37 paid dividends between 2 and 10 per cent, and 53 companies declared or paid no dividends. The dividends figured 4.99 per cent on the total stock. The gross debt, funded and unfunded, was \$78,455,388, an increase of \$3,179,080. The net debt was \$68,008,122—an increase of \$5,097,569. The total capital investment (capital stock and net debt) was \$139,225,047, an increase of \$5,937,509.

The average cost of the street railways of the state per mile of main track, including the cost, but not the length of side track, was \$28,974 for construction; \$10,211 for equipment, and \$13,616 for lands, buildings and other permanent property, making a total average cost of \$52,802 per mile of main track.

The principal statistics of income, expense and traffic were:

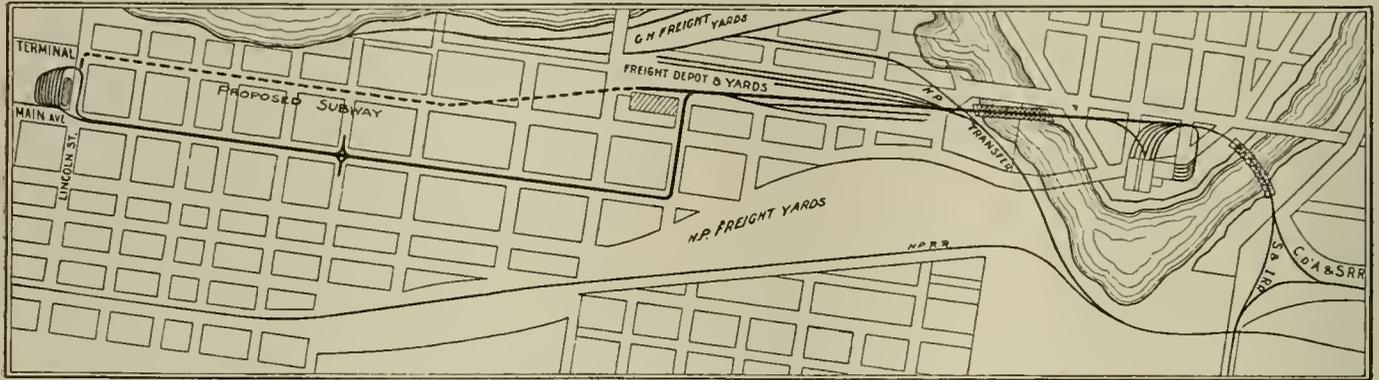

Gross earnings from operation.....	\$29,563,892
Rentals from lease of railway.....	1,337,751
Income from other sources.....	335,804
Total income.....	\$31,237,447
Operating expenses.....	\$19,954,000
Interest on debt and loans.....	3,164,687
Taxes.....	1,923,846
Rentals of leased railways.....	1,518,262
Other charges on income.....	516,580
Dividends paid.....	3,554,073
Total expenditures.....	\$30,631,448
Surplus for the year.....	\$605,999
Increase over previous year—	
Gross earnings from operation.....	\$2,522,601
Total income.....	2,599,195
Operating expenses.....	1,684,741
Total expenditures.....	2,375,382
Surplus for the year.....	222,813

THE SPOKANE ELECTRIC TERMINAL.

The Spokane Electric Terminal was erected early in 1906 by the Spokane Terminal Company, a subsidiary company of the Spokane & Inland Empire Railroad, for the use of the entire Inland Empire system. The system now comprises the Spokane & Inland Railway, which is in operation from

is huff brick and terra cotta, a product of a local manufacturer.

On the first floor are the waiting rooms, ticket office, news stand and parcel room. At the north end are the express and baggage room and the baggagemaster's office, and in the south end the offices of the immigration department of the Inland Empire system are located. The woodwork

corner of Main avenue and Lincoln street, in the block adjoining the site selected for the city's new federal building. The building is oval in shape, extending north and south. It is 50 feet wide by 160 feet long. The terminal grounds are 300 by 500 feet and the tracks are looped around the entire building to avoid switching cars.

The structural material for the exterior of the building

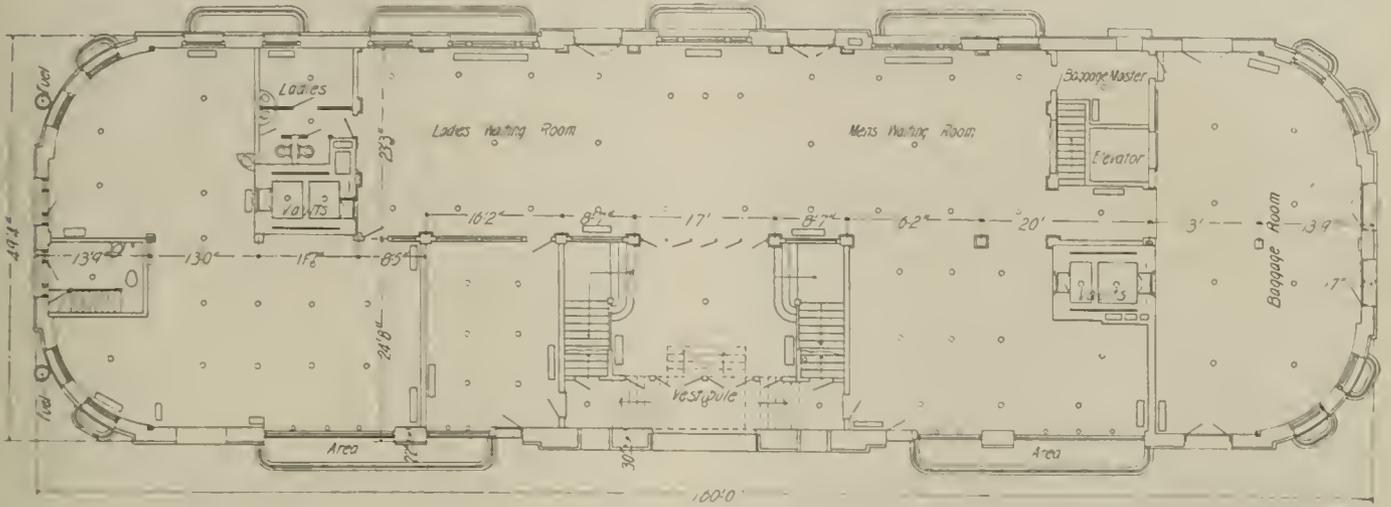

mon landing, from which they ascend to the second and third floors by a second double flight. The stairs are of native marble with iron railing, making one of the most effective features of the interior.

The second floor contains the executive offices of the Spokane & Inland Empire Railroad Company and the several subsidiary companies. The telephone exchange, which con-

nepts with each of the 30 offices in the building, is also on this floor. The offices are on each side of a long circular hall from which they are separated by a glass partition with a 3½-foot wainscoting. Thus all the offices have outside windows and are afforded an abundance of light.

On the third floor are the offices of the auditing depart-

mented about a mile from the passenger terminal. The company has recently applied for a franchise for a subway to connect the two terminals, providing for a double-track tunnel 28 feet wide and 22 feet high, from the passenger station at Main avenue to Front avenue under Lincoln street; thence from Front to about Center street between Bernard and

ment, the chief engineer, the department of publicity and the drafting rooms. Two lines of fireproof vaults extend through all three stories. These vaults are located near the ends of the building and are fitted with polished-steel vault furniture especially designed for the requirements of the different departments.

In the basement, which is conveniently reached by stairs

Browne; thence diagonally from Front avenue, coming to the surface in the freight grounds at a point between Division and Sheridan streets. The company has found that its through trains from outside the city lose considerable time between the city limits and the passenger terminal on account of the crowded condition of the streets. Also it is more or less dangerous to operate such heavy trains through

Spokane Electric Terminal—Exterior of Building.

descending from the waiting room, are the smoking room, men's toilet room, trainmen's room, the steam heating plant and the store rooms. A freight elevator operates between the basement and the first floor.

The building was designed by Albert Held, a Spokane architect, and cost approximately \$110,000.

The freight yards and terminals of the system are lo-

located in the city and it is desired to keep the heavy traffic and the fast through trains off of the streets. After careful consideration of the subject the company's engineers decided on a subway as the best method of improving the conditions, therefore land has been acquired for the purpose.

The construction of the subway will enable the company to bring all through trains to the passenger terminal with the

least inconvenience to its patrons and with safety, and will also permit the handling of freight in the business district, which is not allowed on the surface lines. The plans contemplate looping the subway around the passenger terminal at a depth of 30 feet and building elevators for connecting with the surface, both for passengers and express. It is estimated that the subway will cost nearly \$1,000,000 and will require two years to build.

THE SUBSTITUTION OF THE ELECTRIC MOTOR FOR THE STEAM LOCOMOTIVE.*

BY LEWIS B. STILLWELL AND HENRY ST. CLAIR PUTNAM.

[In its complete form this paper comprises four subdivisions: 1. Presentation of certain facts established by experience in the operation of elevated, subway and interurban lines by electricity. 2. Discussion of comparative cost of operation by steam and electricity applied to railways in operation, and including both passenger and freight service. 3. The importance of standardizing electric railway practice. 4. The question of frequency in the operation of railways by alternating current. The second subdivision and the discussion pertaining to it, will appear in a later issue. Eds.]

The purpose of this paper is four-fold: 1. To record certain facts relative to heavy electric traction which have been established by experience; 2. To present calculations of relative costs of steam and electric traction in railway service based upon these facts; 3. To point out the transcendent importance of standardizing electric railway traction equipment as rapidly as may be consistent with progress; 4. To raise the question whether a frequency of 25 cycles per second or 15 cycles per second should be adopted in railway operation by alternating-current motors.

Few subjects which are today engaging the attention of the engineering world are comparable either in scientific interest or in practical importance to the substitution of the electric motor for the steam locomotive engine. Three-phase and single-phase alternating-current railway motors are now developed to a point where they fairly challenge the steam locomotive, even in long-haul freight service, in which class of work the direct-current motor hitherto has found itself unable to compete with success. The direct-current motor has demonstrated impressively, and upon a large scale, its superiority to the steam locomotive, not only in operating single cars and short trains on lines of moderate length, but also in frequent and heavy passenger service in which the length of train is limited only by the length of station platform, while the motive power equipment far exceeds in power developed the limits hitherto established in steam passenger service.

On the Valtellina line and through the Simplon tunnel 70-ton electric locomotives with three-phase motor equipment, capable of developing a draw-bar pull of 28,000 pounds, have displaced the steam locomotive, with results showing both marked improvement in service and substantial economy in operating costs. In the New York subway eight-car trains weighing 320 tons are in operation, equipped with motors developing during acceleration a tractive effort equivalent to a draw-bar pull of 55,000 pounds.

The heaviest passenger locomotive used on the Erie system, weighs, exclusive of tender, 206,000 pounds, of which 55.8 per cent, or 115,000 pounds, is effective on drivers. Assuming the adhesion to be 20 per cent, such a locomotive exerts a draw-bar pull of 23,000 pounds. The motors of the eight-car electric train of the New York subway, therefore, exert a tractive effort equivalent to more than twice the draw-bar pull of this locomotive.

Managers and engineers of railways using steam are considering the possibilities of electricity. Naturally, the problem usually presents itself in reference to particular cases in which special conditions emphasize the advantages of electric traction; but a point has been reached in the development of electric railway equipment where it is evident that no absolute and permanent limits beyond which the motor may not go can be fixed; and it is not unreasonable to consider the possibilities of the electric motor not only in passenger service but also in freight service, not only in the operation of railway terminals, but also for the operation of railway divisions and even for trunk lines.

At the present time, what is needed is not prophecy but

facts, and particularly facts demonstrated by experience. A study of the relative advantages of steam and electric traction should rest as firmly as possible upon results attained in practical operation. Facts thus established and available to date are insufficient to justify conclusions which in detail may not have to be modified, but it is believed that they are adequate to permit comparative studies leading to deductions, which, as a whole, may be relied upon.

The answer to the question: "Will it pay to electrify?" involves consideration of both relative earnings and relative cost of operation; therefore, before discussing the comparative expenses involved, it is pertinent to refer briefly, even at the risk of repeating what has been said in papers hitherto presented by others, to the more important factors which co-operate in securing for electric traction an increase in earning power.

Passenger Service Factors Contributing to Increased Earning Power.

The more important considerations which affect gross earnings are:

1. Frequency of service.
2. Speed.
3. General comfort of passengers.
4. Safety.
5. Reliability of service.
6. Increased capacity of line.
7. Frequency of stops.
8. Convenient establishment of feeder lines.

1. Frequency of Service: The motor-driven, interurban car operating upon scores of lines in competition with steam railway service has convincingly demonstrated its ability, not only to attract business from competing steam lines but also to create new business. In almost every case where such competition has been encountered by the steam railway, a large part, if not practically all, of its local passenger traffic has been lost. In comparing results attained by the competing systems in such cases, it is impossible, of course, to state in terms of precision how far frequency of service is responsible for the remarkable results observed, since to these results a number of other causes also contribute. But without attempting to differentiate between these various factors, it is sufficient here to say that of the several causes contributing to the marked success of lines using electricity, the operation of train units or of single cars upon close headway is recognized to be especially attractive.

The advantages resulting from frequency of service become relatively less as the length of run is increased. It is recognized, however, that the operation of trains under close headway generally increases traffic, even where the haul is of considerable length, as shown by the experience of the Philadelphia & Reading Railroad in operating its fast trains upon one-hour headway between New York and Philadelphia.

2. Speed: The possibilities of operating by electricity at speeds exceeding the maximum which can be obtained safely in steam operation, owing to the elimination of unbalanced reciprocating parts of the locomotive, is well-known. It was strikingly illustrated in the Berlin-Zossen trials by the attainment of a speed exceeding 130 miles an hour. These tests demonstrated the ability of electric equipment to operate at a sustained speed more than twice as great as that of our fastest express trains on runs of any considerable length, and exceeding by about 50 per cent the maximum which can be attained even for a short distance by the steam locomotive with a reasonable degree of safety.

Even at speeds at which steam locomotives may be operated without great danger of leaving the track, as a result of the effect of unbalanced reciprocating parts, electric engines are far better able to maintain speed while drawing heavy trains. At speeds of 80 or 90 miles an hour, for example, it is extremely difficult to operate with satisfactory results two steam locomotives at the head of the train; while multiple-unit control places any necessary number of locomotive units absolutely and instantly responsive to the will and touch of a single operator. At high speeds, also, the economy of the steam locomotive falls off rapidly while that of its competitor remains practically constant.

The increase in average speed resulting from the relatively high acceleration obtainable in the use of multiple-unit electric equipment in service where stations are very close together, e. g., elevated and subway lines in cities, and in suburban service in the vicinity of large cities, has been frequently discussed from the theoretical standpoint and is well understood.

3. General Comfort of Passengers: The great advantages of electric traction in respect to comfort of passengers are well known. Cleanliness and improved ventilation made possible by the elimination of smoke and cinders; lighting prac-

*Extracts from a paper presented at the 213th meeting of the American Institute of Electrical Engineers, New York, January 25, 1907.

tically without heat and at low cost by a system which makes it easy to place lamps in any desired location, and heating apparatus effectively and conveniently controlled, are factors of very great importance in building up passenger business under conditions of competition. In operating through tunnels, ventilated with difficulty, the electric motor, in eliminating smoke and the gases of combustion, possesses an advantage which is frequently controlling.

4. Safety: So much has been said and printed in the daily press regarding the alleged dangers of electric traction, that it is well to place on record here a statement of the considerations which inevitably lead to the conclusion that electric traction, if the equipment be properly designed and installed, is essentially and materially safer, so far as the traveling public is concerned, than steam traction. The more important of these considerations are:

a. The fact that in case of a rear-end collision, which is perhaps the most frequent form of accident experienced in the operation of our railway systems, the energy which propels the electric train can be shut off generally with great promptness. On the other hand, the steam locomotive carrying in its firebox from 1,500 to 2,000 pounds of coal heated to incandescence, almost invariably sets fire to any broken cars, or other combustible material with which it comes in contact. Where the electric supply to trains is obtained at low potential from a third rail, the risk of short circuit, which may result in fire if the cars be not fireproof, is greater than it is in the case of overhead construction, even when the voltage employed in the latter case is very high. In fact, in the latter case it may be said that risk from the physiological effects of the current or from fire resulting from short circuit, is practically eliminated, except perhaps in tunnels of very limited clearance.

b. The elimination of the boiler carrying steam at high pressure, also means the removal of an element of risk which in many railroad accidents has destroyed life.

c. The absence of smoke in tunnels, and consequent ability to see signals clearly at all times, constitutes an advantage of the utmost importance for electric operation.

d. Cars drawn by steam locomotives must be heated either by steam from the locomotives, or by some form of stove carried on the individual cars. In the former case, steam from broken steam pipes becomes a serious source of danger in case of accident; in the latter the hot coals from the stove, even in the improved modern types which have greatly reduced the risk formerly encountered, are a source of danger. The substitution of the electric heater affords opportunity not only for ideal control of temperature of the cars but almost absolutely eliminates risk of fire.

e. The elimination of the gas tank and the oil lamp used for lighting in steam traction, and the substitution of electric lighting, also imply a material gain in safety.

f. The danger of derailment in the case of the electric locomotive is far less than in case of the steam locomotive, by reason of the elimination of unbalanced reciprocating parts which tend to lift the steam locomotive from the tracks. The hammer-blow also, in the case of the steam locomotive, is responsible not infrequently in cold weather for broken rails, as a direct result of which many serious accidents have occurred.

g. The electrification of railways where high-speed passenger traffic is involved, affords opportunity for improved methods of protecting trains by signal systems, automatic or other.

h. The ability to cut off power at will from a given section and therefore from trains operating upon that section under certain conditions, which arise not infrequently in railway service, may be availed of to prevent accidents. In steam railway service, when an operator at a tower having allowed a train to pass learns too late that another train is approaching in the opposite direction, he is powerless to avert the impending collision. Where the motive power of these trains, however, is transmitted by electricity, the power supplied to the section might be cut off and probably in time to prevent the catastrophe.

As against the considerations above referred to, all of which tend to make electric operation safer than operation by steam locomotive, the addition to the permanent-way equipment of an electric conductor conveying power to trains imposes in the former case a material risk not involved in the latter. If the power be supplied through a third rail, a guard should be used whenever possible to prevent accidental contact with the rail by employees or by others walking upon or crossing the track. Several effective forms of guard are available, of which at least one has been in service upon a connecting scale for five years.

5. Reliability of Train Service: Interesting evidence in respect to the relative reliability of steam locomotives, and of electric motors carried upon cars and controlled by the multi-

ple-unit system of train-control, is derived from the official records of the transportation department of the Manhattan division of the Interborough Rapid Transit system of New York. Upon the elevated lines, steam locomotives were used from the inauguration of the first constituent line of the ultimate system in 1872 until 1902, during which year and a part of the following year, electric equipment was gradually substituted. The locomotives were operated under exceptionally favorable conditions, were not overloaded, were of simple construction, and admirably maintained. The electric equipment that succeeded them is operating trains which average 5.3 cars as against 3.8 cars in the days of steam operation. The average speed is materially higher. The tractive effort during acceleration of a six-car train is 30,000 pounds, as against a maximum draw-bar pull of approximately 7,000 pounds exerted by the steam locomotive.

Accurate record is kept of the duration of every delay in the operation of the trains. The results for the months November, 1900, to March, 1901, when steam was used, and the corresponding months of the years 1905-6 under conditions of electric operation, illustrate in a striking manner the marked gain in reliability of service which has resulted from the adoption of electricity. For the five months of steam operation the aggregate car-mileage was 18,527,773 miles, and the aggregate delay 8,258 train minutes. The car-mileage per train-minute delay was 2,243.

For the corresponding period of electric operation, five years later, the car-mileage was 25,482,081, the aggregate train-minutes' delay 5,970 and the car-mileage per train-minute delay was 4,268.

It will be noted that the months involved in the above comparison are those in which the difficulties of operation, owing to weather conditions and number of passengers transported are at a maximum. Snow and sleet are among the greatest difficulties to be overcome in the operation of a third-rail system, when, as in the case of the Manhattan, the third rail cannot be effectively protected by reason of limitations in space available on the structure. In view of these difficulties and of the increase in density of traffic, the results obtained are remarkable.

6. Increased Capacity of Line: Electric traction as compared with steam traction enables us to develop much greater sustained tractive efforts with given weight on drivers, by reason of more uniform rotative effort. Even where electric locomotives are used, it also eliminates dead weight by abolishing the tender and facilitating construction under which practically the entire weight of the locomotive is carried upon the drivers. Where the locomotive is dispensed with, and the motors mounted directly upon trucks of cars constituting the train, the best results are obtained, the proportion of weight upon wheels driven by motive power being greater than is otherwise practicable. This increase in weight available for adhesion, in conjunction with the characteristics of the electric motor, makes it possible to attain in electric service rates of acceleration altogether impracticable in steam service; consequently trains in passenger service where short headway is desirable can follow each other at shorter intervals than is feasible where steam motive-power equipment is employed.

In the operation of freight trains, if it should ever become practicable to distribute electric locomotives throughout the length of the train and operate them by multiple-unit control, trains of length far beyond present limits could be operated. At present, the length of a freight train is limited by the strength of the draft-gear, and steam locomotives cannot advantageously be distributed at intervals throughout a very long train, as no means is available for controlling their effort simultaneously and satisfactorily.

Obviously, a system permitting distribution of the motive power at convenient intervals throughout the train, and simultaneously controlled by the hand of a single engineman, presents possibilities of increasing track capacity which under conditions now existing on many through lines should be of great value.

7. Frequency of Stops: The interurban electric line competing with the steam railroad for traffic between two cities possesses great advantage in the collection and distribution of passengers, from the ability of its cars to stop at any street intersection or other convenient point, instead of receiving and discharging passengers at a single railway station in each town. These frequent stops, however, operate to reduce speed materially, and but for the ability of the electric equipment to accelerate rapidly the limitation would be very serious. As speed between terminals is increased, the tendency to reduce the number of stops made to take on or let off passengers is noticeable in the development of many interurban lines.

8. Convenient Establishment of Feeder Lines: Frequency of stops for convenient collection and distribution of passen-

gers, and high speed between terminals, being considerations which are essentially opposed, the advantages of a four-track system permitting operation of local or collecting train units on two tracks, and express trains on the other two tracks, are obvious. The great expense of such a system, however, can be borne only where traffic is very heavy.

A natural development which during the last five years has been very rapid, is found in the use of comparatively short electric trolley lines in connection with steam express service for long-distance runs. This method of utilizing the advantages of local electric lines by the companies operating trunk-line systems is eminently wise, and in general should be highly advantageous to the properties concerned while increasing materially the facilities offered to the public. It may be pointed out, however, that were the trunk-line systems to utilize electricity for through traffic, the extension and systematic improvement of local feeders would be facilitated for a number of reasons, notably:

1. The fact that power developed in large amount, as for the operation of heavy through traffic, is produced at low cost per unit, and would be available at all points along the line for the operation of cars on local feeder lines.

2. The convenient possibility of attaching cars or short trains arriving on local lines to through trains at points of junction. The multiple-unit system of car equipment lends itself admirably to this method of operation.

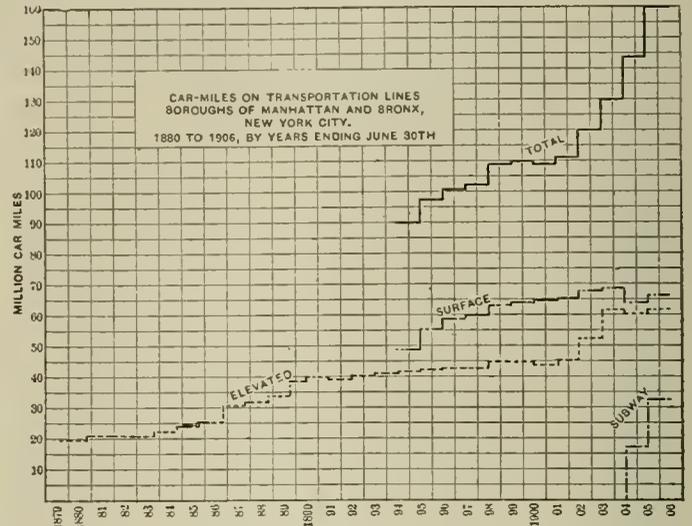

Illustrations of Passenger Business Developed by Interurban Electric Lines.

In a very comprehensive paper presented by Mr. J. G. White before the International Engineering Congress at St. Louis in 1904, the following striking illustrations of the advantages of frequent service are given:

"Cleveland-Oberlin Line: These cities are 34 miles apart. The competitors for passenger traffic between these cities and intermediate points are the Lake Shore & Michigan Southern Railroad (steam) and the Cleveland Elyria & Western (electric). In 1895 the total number of passengers carried by the steam railway between these cities and intermediate points was 203,014. This total decreased gradually after the competing electric line was opened to a minimum in 1899 of 71,755, from which it gradually recovered in 1902 to 91,761, but during this same year the electric road carried a total of about 3,000,000.

"Cleveland-Painesville Line: These cities are 39 miles apart. The competitors for passenger traffic are the Lake Shore (steam) and the Cleveland Painesville & Eastern Railway (electric). In 1895 the steam road carried between the terminals and intermediate points 199,292 passengers, but in

operating a double-track system between the cities of Scranton and Wilkesbarre, Pa., carried, during the four months ending October, 1906, 1,396,833 passengers. This railway, 18 miles in length, competes with two double-track steam railways having excellent terminals in both cities, and with a third double-track steam railway having an equally good terminal in Scranton, but a less favorably located terminal at the Wilkesbarre end of the line. The electric railway charges

Electric Motors Versus Steam Locomotives—Figure 2.

30 cents for the ride between the two cities and sells round-trip tickets for 50 cents. Except at certain hours, it operates its service upon 10-minute headway. At least one of the steam railways, in the endeavor to retain its passenger business, has reduced its rate to 40 cents for the round trip. It has also increased the frequency of its train service. We have been unable to ascertain the number of passengers carried by the competing steam lines during the four months above referred to, but the earning power of frequent electric service is strikingly demonstrated by the fact that this railroad operating in competition with three double-track steam railways of practically identical length and substantially equal terminal facilities, should be doing a business which represents an income of \$5.00 per capita per annum of tributary population, including that of the terminal cities.

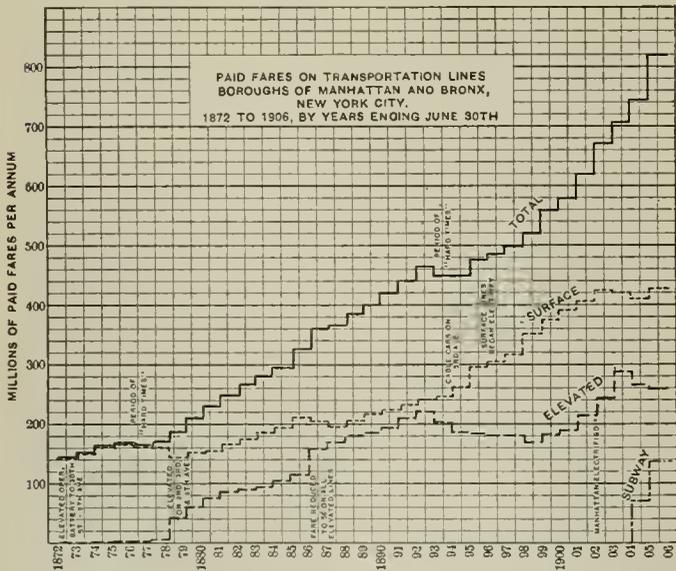

Electrification of Transportation Systems in Manhattan and The Bronx—Effect Upon Traffic.

A study of the transportation statistics of New York City, particularly during the last decade, is not only of great local interest, but is instructive as illustrating the effect of improvement in transit facilities upon gross receipts.

The data graphically summarized in Figures 1, 2 and 3 have been compiled from official records, those subsequent to June 30, 1883, being obtained from the reports of the Railroad Commission of the State of New York. The effects of improved service are clearly evident from an inspection of these figures.

In Figure 1, the line marked "Total" indicates for each year ending June 30, the aggregate paid fares collected by all surface, elevated, and subway lines in the Boroughs of Manhattan and Bronx. It will be noticed that the aggregate paid fares for the year ending June 30, 1894, and also for the following year, were slightly less than for the year ending June 30, 1893, this reduction doubtless being due to the hard times which then prevailed. With this exception, the aggregate of paid fares for all lines shows in each year an increase over the preceding year. Comparing the Manhattan system for the year 1893 with the same system for the year 1899, a decrease of 21 per cent in paid fares is shown. During the same period the paid fares of surface lines, which meanwhile in large degree had adopted electric operation, increased by 43 per cent. That the decrease in business on the elevated lines was not due to any decrease in the service, is shown by Figure 2, from which it will be seen that the car mileage operated increased steadily during this period. The unavoidable inference is that the diversion of traffic to the surface lines was a direct result of the improved service offered by the latter.

During the year ending June 30, 1901, the last fiscal year of steam operation on the elevated lines, the Manhattan system collected 190,045,741 fares. The surface lines collected

Electric Motors Versus Steam Locomotives—Figure 1.

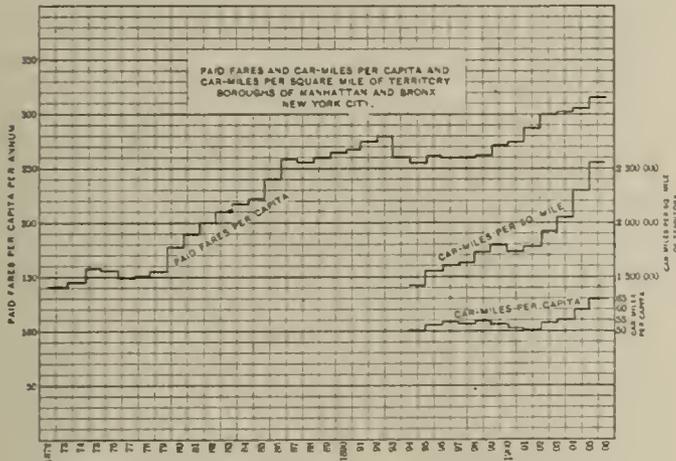

1902 it carried only 28,708 passengers, while the electric system carried 1,537,754 passengers.

"Cleveland-Lorain Line: These cities are 26 miles apart. Competitors are the New York Chicago & St. Louis Railroad (steam) and the Lake Shore (electric). In 1895 the steam road carried 42,526 passengers, but in 1902 it carried only 9,795 passengers, the electric road in the same year carrying 3,896,902 passengers."

The Lackawanna & Wyoming Valley Railway Company,

388,108,794 fares. During the year ending June 30, 1904, the Manhattan system, now operated by electricity, collected 286,634,195 fares, an increase of 50 per cent, while the surface lines collected 419,423,092, an increase of about 8 per cent. In the following year, 1904, the subway began operation, and both elevated and surface lines recorded a decrease in fares collected.

In Figure 4 are plotted curves showing the population of, a, Greater New York and, b, the Boroughs of Manhattan and

Electric Motors Versus Steam Locomotives—Figure 3.

The Bronx. The points which fix these curves from 1860 to 1900 inclusive, are from the United States Census Reports. For the years 1910 and 1920 the estimated population is based upon the average rate of change in the per cent increase per decade from 1860 to 1900. Up to 1905, the population as indicated in these curves is undoubtedly not far from the fact; for 1910 and 1920 the probable populations indicated are interesting, although the curves take no account of the effect of improved transit facilities between Manhattan and Long Island, and between Manhattan and New Jersey.

Notwithstanding the very rapid increase in population of the Boroughs of Manhattan and Bronx from 1890 to 1905, the paid fares collected by the several transportation systems have increased still more rapidly, as shown in the curve of paid fares per capita in Figure 3.

In the same figure are shown the increase in car-miles per capita per annum, and in car-miles per annum per square mile of territory served.

While it is not directly pertinent to this discussion, we would here call attention to a fact of great importance to those responsible for the development of the systems of transportation in the city of New York; viz., the fact that while for the year ending June 30, 1906, the subway carried 137,919,632 passengers, the aggregate carried by the elevated and surface lines was but 23,684,957 less than the aggregate carried by these lines during the year ending June 30, 1904, the last fiscal year before the subway began operation. In other words, comparing the year 1906 with 1904, the aggregate paid fares on elevated, surface, and subway lines, increased by 114,234,675, which is about three-fourths the ultimate capacity of the present subway. It is evident from inspection of these curves, that the existing systems are destined to be still further and greatly overcrowded before additional subways can be completed.

It is, of course, impracticable in studying the results of improved service in the electrification of elevated, surface and subway lines in New York, to attempt to differentiate the causes which have contributed to the increased traffic. While that increase has been due undoubtedly in large part to the improved service offered, it is also obvious that the number of passengers carried would have increased very materially by the growth of population, even had no improvement in the old conditions of service been effected. But it cannot be too strongly emphasized, that while from one point of view improved transit facilities are a result of increased population, from another and equally tenable point of view, increased population is a result of improved transit facilities.

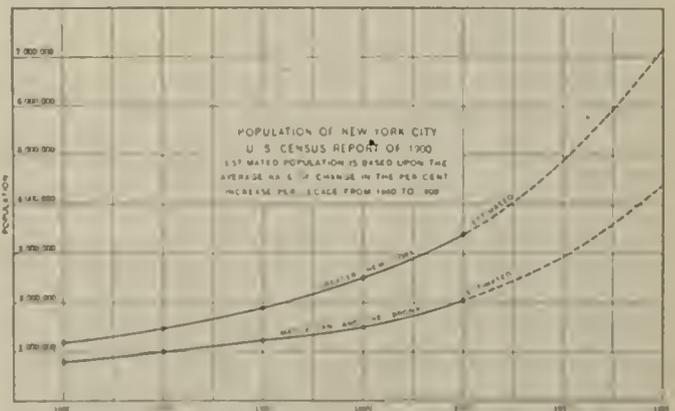

The Standardization of Electric Railway Traction Equipment.

Electricity, entering the field hitherto occupied exclusively by the steam locomotive, encounters conditions which greatly emphasize the necessity for prompt standardization of engineering practice. The management of our railways, beginning by electrifying terminals, tunnels, and mountain

grade divisions, will inevitably be led to extend these zones of electrification until they include divisions of very considerable length, and even trunk-line systems. To call attention to the transcendent importance of standardizing the location of such additions to permanent-way equipment as the overhead trolley conductor and the third rail, is to demonstrate its necessity.

Electrical engineers now generally recognize the great value of established standards of frequency and potential in plants installed for lighting and power purposes. In recent years, the Institute, through its standardization committee, has done splendid work for the manufacturer of electrical apparatus, as well as for the investor, by using its influence to promote the adoption of standards. Not many years ago, however, manufacturing companies, and consulting engineers, were in many cases prone to put forward or specify apparatus without reference to its ability to operate effectively in conjunction with other central-station equipment, even when the latter was in actual operation in the immediate vicinity of the new plant. Fortunately, this tendency was less marked in the United States than it was, for example, in Great Britain. What will happen from a failure to adopt standards of practice at an early stage in the development of an industrial art of this nature, is well illustrated by the problem now presented in London, where the engineering advisers of the London County Council are engaged in studying the problem of how to supply electricity in bulk to 62 central station plants producing electricity in bewildering variety of frequency and potential.

In the railway field, obviously, general principles are the same as in lighting; but wise foresight is more necessary and failure to exercise such foresight at this date less excusable. Moreover, the advocates of electric traction, unlike those who introduced the electric light into commercial service, are called upon to deal with a great body of trained engineers and experienced managers who are engaged in operating and extending systems of transportation which challenge admiration and respect. The rolling stock equipment of our railways, as a whole, is justly an object of national pride. The engineers and managers directing and controlling these properties are probably the equal of any body of men in the world as regards intelligence and experience. Obviously, it is of the utmost importance that they who accept the responsibility involved in the substitution of electricity for steam in the operation of certain parts of our great railways, should avoid fancies or fads and should in every way co-operate in the great work of evolving promptly standards of electric railway practice which shall withstand the test of time. The comparatively small beginnings of today will in all probability extend with a rapidity which we cannot now realize, and the confusion and loss which will inevitably result in the near future, if a variety of electric equipment be grafted at different points upon the existing railroad sys-

Electric Motors Versus Steam Locomotives—Figure 4.

tems now operating by steam, may be imagined. The trouble and expense caused some years ago by the existence of several gauges of railway track in America were as nothing compared with what may result from a failure to establish promptly standards of practice in the field of electric railway traction.

Where today are the "16,000 alternation" system of lighting, the "15,000 alternation" system of lighting, the "constant current alternating current arc light system," the "40-cycle system" and the "monocycle system?" Where ten years from today will be the 1200-volt, or the 1500-volt, direct current systems which have been suggested as substi-

tutes for high-potential alternating-current systems in heavy electric traction?

While emphasizing the great importance of the early establishment of standards in the field of heavy electric traction, it must be recognized clearly that further inventions are liable at any time to modify views based upon present knowledge. The work of standardizing, therefore, should proceed with caution; but surely if present knowledge, not only of existing apparatus, but of the lines along which applicable improvements must take place is not sufficient to justify conservative application of the principle of standards, it is not sufficient to justify the investment of the very large sums which are now being expended for electric equipment.

Engineers constituting the membership of this Institute owe it to themselves, as well as to their clients, to use every effort without prejudice and without fad, to prevent waste by opposing the introduction of apparatus which, from its limitations, cannot solve the general problem of railway electrification; and it is to be hoped that they will use their united influence to fix proper standards as rapidly as this establishment may be consistent with progress.

Fortunately, knowledge of the possibilities and limitations of electric apparatus today is a very different thing from what it was in the early days of electric lighting. At the present time we have available theory so complete that electric science is less exact only than the science of astronomy and in applying this science in constructive work agreement between results carefully predetermined by calculation and those realized in practice is far closer than in any other comparable branch of engineering. There can be no doubt that it is possible today, in passing upon such a question, for example, as that of best frequency for railway operation, to make a choice which shall withstand the test of time.

The necessity for proper standardization is obvious. Specifically, it would seem feasible and eminently wise to agree upon standards of practice in respect to the following:

- a. Location of third rail.
- b. Location of overhead conductor used with single-phase alternating-current system.
- c. Frequency of alternating-current traction systems.

It is equally desirable, but probably less easy, to agree upon a standard system of multiple-unit control for train operation.

The Question of Frequency.

While appreciating thoroughly and desiring to emphasize the importance of establishing and maintaining standards, it is also of the greatest importance that standards should be wisely chosen. The choice should be made, if possible, with full knowledge of the essential factors involved and correct perspective view of their relative importance. It is with the feeling that so far as the frequency 25 cycles per second may be said to have become established, considerations obvious at first glance, but not properly controlling, may have influenced unduly the choice that we desire to present for discussion, the very important question whether 25 cycles per second or a lower frequency; e. g., 15 cycles per second, is best adapted and should be established as a standard in the equipment of railways by electricity.

Final decision of such a question should be left neither to manufacturing companies, the management of which may be unduly influenced by commercial considerations, affecting its own immediate prosperity or convenience, nor should it be left to the individual consulting engineer. It is precisely the kind of question which the Institute should pass upon by the adoption of a recommendation carefully considered by its standardization committee. The manufacturing companies, which are largely and very influentially represented in the body of the Institute, will doubtless be willing to cooperate in the collection and study of the facts requisite to the formation of a well-grounded report.

While the adoption of a standard by the Institute has the force only of a recommendation, the American Railway Association perhaps might deem it wise to indorse the choice of the Institute. Such action on the part of these two bodies would go far definitely to establish the standard.

Comparing the relative advantages of 25 cycles and 15 cycles in railway service the salient advantages of the former are the following:

1. It is today in extensive use in plants developing and distributing energy for lighting and power purposes, and through sub-stations equipped with converters for the operation of many interurban lines. It has been adopted on a very large scale by such companies as the Interborough Rapid Transit Company of New York for the operation of its subway, surface, and elevated lines, by the Pennsylvania and Long Island Railway companies for the electrification of the

New York terminal service and operation over a considerable part of Long Island and by the New York Central for the electrification of its terminal service. It is also the frequency developed by all of the great power plants at Niagara Falls, and from this source of power it is possible for all railway lines within a radius of 150 miles, or an even greater distance, to procure an ample supply of very cheap power.

It has been adopted by the New York New Haven & Hartford Railroad Company, the pioneer among American railroads in the adoption of the alternating-current motor in heavy railway traction, and by the Grand Trunk Railway for the electrification of the Sarnia tunnel. Alternating current at 25-cycles is also utilized without the interposition of converters by the motor equipment on a dozen or more interurban trolley lines.

2. Our great manufacturing companies have drawings, patterns, and dies which enable them to manufacture conveniently and promptly practically all power-house and substation equipment required for 25-cycle apparatus. The weight of this consideration, however, is somewhat lessened by the fact that the march of progress—just now greatly accelerated by the general adoption of steam turbines—will undoubtedly cause a large proportion of existing drawings and patterns to be superseded probably in the very near future and certainly within the next five years.

3. The 25-cycle system is preferable to the lower frequency in the design of turbo-generators, since it affords wider range within which to select speed for units of various outputs. For very large units a frequency of 15-cycles, for example, requires either a 2-pole generator operating at 900 revolutions per minute, a large 4-pole generator operating at 450 revolutions per minute, or a 6-pole generator operating at 300 revolutions per minute. Reduction in the number of revolutions per minute implies increase in diameter of the revolving element of generator and turbine and in machines of output the diameter of the revolving element in turbines of certain types may become too large for shipment in view of the limitations imposed by tunnels.

4. A frequency of 25 cycles permits convenient and effective lighting of yards and shops by incandescent lamps. It is also more favorable than a lower frequency as regards operation of induction motors for shop purposes.

Should our railways in general be equipped for electric operation, it is to be expected that in many cases they would undertake to supply electricity for light and power purposes beyond their own requirements, and the higher frequency possesses important advantages with reference to such commercial service.

For lighting and general power purposes in cases where service for lighting purposes that shall be thoroughly satisfactory in respect to voltage, regulation and continuity is requisite, commercial supply at 25 cycles would be preferable. Through the interposition of motor-generator sets or converters in combination with storage batteries in such cases either frequency is applicable.

5. The higher frequency possesses some advantage in respect to the ratio of tractive effort to weight upon drivers. The best information available to date appears to indicate that the difference between 25 cycles and 15 cycles in respect to this consideration probably approximates 10 per cent. Further data from actual tests are desirable, and must be obtained before it is possible to estimate closely the weight of advantage possessed by the higher frequency.

6. The higher frequency is preferable for induction motors in railway service requiring a considerable range of speed adjustment. The force of this consideration depends upon the probability of using induction motors for traction purposes, and applies not only to the excellent three-phase motors, such as are in very successful use upon the Valtellina line, but also to the single-phase induction motor which, perhaps, is not beyond the range of probability. It is probable that in any general electrification of our railway systems, induction motors will play a part by no means unimportant.

Without attempting detailed discussion, it is evident from the foregoing brief statement of the more important considerations in favor of 25 cycles that extremely weighty reasons must exist if the adoption of a lower frequency, e. g., 15 cycles is justified.

While our object in raising this question of frequency is to present it for discussion with a view to securing additional data and, if possible, a careful consideration of this very important question by the Institute through its standardization committee, or a special committee, and while we desire to avoid anticipating the verdict resulting from such an investigation, it is proper to state here that consideration of the facts now available leads us to conclude that, notwithstanding the number and force of the arguments in favor of 25 cycles, a frequency of 15 cycles is preferable and should

be adopted for heavy electric traction. The fundamental and, as it would appear, controlling reason which leads to this conclusion is the fact that within given dimensions a materially more powerful, efficient, and generally effective single-phase motor can be constructed for 15-cycle operation than is possible if 25 cycles be selected.

Final decision of the question whether the advantages of the 15-cycle motor as compared with the 25-cycle motor in respect to dimensions, weight, efficiency, power-factor, and commutation are such as outweigh the many and important considerations which favor the higher frequency, requires more complete data than we have been able to secure up to the present time. That the difference is material, however, is established not only by general theoretical considerations of the effect of a reduction in frequency upon the design and performance of single-phase commutating motors, but also by the following facts:

1. In the case of multiple-unit equipment of passenger cars where locomotives are dispensed with and motors carried upon the car trucks, it is very important that the dimensions of motors be reduced to a minimum. Cars weighing say, 35 tons without equipment and operating on straight and level track at speeds of from 60 to 70 miles an hour, require but two motors, except as it may become necessary to employ four motors by reason of lack of sufficient clearance at cross-overs. The difference between a two-motor equipment and a four-motor equipment in such a case approximates \$2,500 per car, besides which the four-motor equipment adds materially to weight, practically doubles complication, and, for both of these reasons, increases cost of operation. The difference between the dimensions of a 15-cycle and a 25-cycle motor may easily be the controlling consideration compelling the adoption of the four-motor equipment.

2. In the application of single-phase commutating motors to locomotives in general railway service, the minimizing of motor dimensions is perhaps still more important although in this instance the limitations imposed by the space available are less obvious.

High-speed passenger locomotives at least should be gearless. For any assumed limits of weight per axle and length of wheel-base, that frequency is preferable which permits the construction of a motor which will exert the greater pull at the draw-bar, provided efficiency, commutation, and power-factors are substantially equal.

Those who are engaged directly in the design of single-phase motors are probably in position to contribute to the discussion of this paper data which will throw much light upon the subject; but it would seem probable that within given limits of dimensions, 15-cycle motors would materially surpass 25-cycle equipment in this respect. We are inclined to this opinion notwithstanding the probable advantage of 25-cycle equipment as regards the ratio of effective draw-bar pull to weight upon drivers.

3. There can be no question of the superiority of the 15-cycle motor in respect to the very important features, commutation, efficiency, and power-factor. Efficiency is obviously and directly important. Power-factor affects the efficiency of the entire system from the motor to, and including, the generator. Commutation, in view of the large and expensive commutators and the brush complication of this type of motor, is of great importance.

In order that the question raised may be looked at in proper perspective the following estimates based upon foregoing calculations will be useful:

For the equipment of the entire railway system of the United States as now existing an aggregate power-house output capable of supplying continuously 2,100,000 kilowatts would be required. Of the electric apparatus installed in the powerhouses, a change in frequency affects the generators, transformers, and a large proportion of the measuring and indicating instruments. It also affects the cost of the engine or turbine employed to drive the generator. At 25 cycles, the apparatus affected by frequency should cost approximately \$30 per kilowatt. At 15 cycles it would cost on the average perhaps \$32 per kilowatt. Cost of substation transformers would be increased approximately one-third, and, in round numbers, the total cost of turbines and electrical power-house and substation apparatus would be increased from \$70,000,000 to \$80,000,000.

If it be assumed that one electric locomotive will do the work of two steam locomotives, about 24,000 electric locomotives would be required to take care of the present railway business of the country. Assuming the cost of the average electric locomotive to be \$25,000 the aggregate cost of locomotives required would be \$600,000,000. Allowing for the increased cost of the 15-cycle transformers, it would seem that the difference in cost of the average locomotive should

be not less than \$1,000 in favor of the lower frequency, or for 24,000 locomotives \$24,000,000. This is more than twice the estimated difference in cost of power-house and substation equipment.

It seems entirely safe to say, therefore, that the aggregate first cost of electric equipment and of steam turbine will be decreased by a change from 25 cycles to 15 cycles. The operating cost will obviously be decreased very materially. At least three-fourths of the above estimated cost of electric locomotives, say \$450,000,000, represents cost of electric equipment. It will be seen, therefore, that of the apparatus which our electrical manufacturing companies may be called upon to furnish, more than 85 per cent is rolling stock. Obviously, any argument in favor of 25-cycle equipment which may rest upon existence of drawings and patterns and convenience in manufacturing should have comparatively little weight.

The use of 15 cycles instead of 25 cycles also secures considerable advantage in respect to the overhead trolley conductor and track return. With a given limit of voltage drop, this advantage may be utilized by reducing size and, consequently, the cost of the overhead copper and the copper used to reinforce the track return.

Under the plans which we have assumed as a basis for our calculations, the amount of copper required for feeder circuits, trolleys, and reinforced track-return, estimated at 20 cents per pound would cost approximately \$750,000,000 were the entire railway system of the country as existing in 1905 to be equipped for electric operation.*

We desire to acknowledge with appreciation, assistance kindly rendered in the collection of data for this paper by Mr. J. M. Graham, vice-president of the Erie Railroad Company; Mr. Theodore N. Ely, chief of motive power of the Pennsylvania Railroad Company; Mr. George Gould; Mr. E. P. Bryan, vice-president, and Mr. Frank Hedley, general manager of the Interborough Rapid Transit Company; Mr. G. Love, of the Railway Electric Power Company; Mr. Alvan Markle, president of the Wilkesbarre & Hazleton Railway Company; Mr. George C. Smith, vice-president of the Security Investment Company; Mr. H. J. Pierce, president of the International Railway Company; Messrs. Conwell, Shepard and McLaren, of the Westinghouse Electric & Manufacturing Company; and Messrs. Potter and Mahony, of the General Electric Company.

Discussion.

The discussion was opened by Mr. Frank J. Sprague, consulting engineer, New York City.

The authors have given us a very interesting resume of statistical information based almost entirely upon direct-current operation. They plead for standardization of electric railway apparatus, and if I read the report correctly for a standardization along the lines of operation, 11,000 volts, alternating-current trolley at 15 cycles. The authors ask where 10 years from now will the 600-volt, 1200-volt or 1500-volt—and I see my initials under all of them,—where will they be? Right here; just where the 500 and 600-volt operation of the past 19 years have been, right here. I do not believe you quite appreciate the modest work which is being done today by those who are actively developing the higher tension direct-current work.

I do not find it necessary, to come to any conclusions on the electric railway business, to generalize all the railroads of the United States. There are a lot of them in the hands of receivers, and some of the others ought to be. They could not be taken out of the hands of a receiver if they were electrified, and could not raise the money to be electrified if they wanted to be. I prefer to deal with the living, immediate question. There are now three great trunkline railroads in New York City which in the near future will be electrified, or terminated in New York City, to say nothing of those terminating in Jersey City and elsewhere. One of them is developing electrification along certain lines, and the others on somewhat different lines. There has been considerable discussion as to the wisdom of both. I have been guilty of some of the development on one, and I am not ashamed of it. I have criticized some of the development on the other, and I do not know that I am ashamed of that, but leaving these two out of consideration, where do we need to look for a typical trunk line division than the third road, the Pennsylvania, from here to Philadelphia; an engine run, and than which there is no more typical trunk line division in the world. I am going to venture, not a prophecy, but a statement. If that line were called upon to be

*In all our estimates we have included 0000 copper conductor in the return circuit, this being bonded to the rails at intervals for the purpose of preventing dangerous potential on track in case of a broken bond.

electrified today, it would not, in my judgment, be overhead, single-phase alternating-current equipment, whether 25, 15 or 1 cycle. It would be a half-cycle, and the cycle would be the length of time between two runs. I am going to make the prophecy, that on a large number of the lines which can by any stretch of imagination be considered as subject to a reasonable prospect of electrification, 1,200 or 1,500 volts will on any present development known, give better results in every way than alternating current, 15 or 25-cycle, overhead system.

The Proper Frequency.

Mr. B. G. Lamme, Westinghouse Electric & Manufacturing Company—As the time is limited, I will confine myself to the question of frequency alone. It may be of interest to consider the changes in frequency from the earliest time to the present, and see what Mr. Stillwell has had to do with such changes. Back in the early times of alternating-current work, 133 cycles per second was the common frequency. About 1889 or 1890, Mr. Stillwell, in going over the problem, saw that the larger work which was coming called for a lower frequency, and he was one of the strongest advocates in adopting 60 cycles as against 133. A few years later, in connection with the Niagara Falls first large generating station, the question of a still lower frequency came in, and Mr. Stillwell practically made the decision in favor of 25 cycles. At that time it was considered that the development of street railway work, and the use of rotary converters in such work, was such that it was more economical to use the lower frequency. He now comes forward with 15 cycles for heavy railway work on the basis that the field is going to be large enough to call for a new and more suitable frequency. It seems to me also that, considering the total amount involved in the electrification of the railroads of this country, about \$1,500,000,000, the problem is big enough to call for a frequency which is best suited for the work. The question is whether that should be 25 cycles or something lower.

Over four years ago I presented a paper before this Institute, in which I described the Washington Baltimore & Annapolis single-phase railway, and the frequency given was 16 $\frac{2}{3}$ cycles, a ratio of 2 to 3 to the standard frequency of 25. There were certain reasons for adopting that particular frequency, although 10 per cent higher or lower would not have been of very great importance, so far as the operation of the apparatus was concerned. It was found at the time that there was considerable opposition to the use of lower frequency, principally because most of the projects presented involved existing power plants, or it was necessary to tie the new plant to existing power plants. The projects were also relatively small. Because of commercial conditions we were practically forced to begin at 25 cycles. However, I still advocated the use of lower frequency when it came to heavier work, as will be found in my discussion of single-phase railway apparatus at the American Institute meeting at the St. Louis Exposition in September, 1904. At that time I said that I considered the heavy railway electrification of sufficient importance to warrant the use of low frequency, which is most suitable for such work, independent of any frequencies already in use. I still hold to that opinion.

The strongest reason which can be given for the lower frequency is the greater output than can be gotten from a given motor. For instance, with a first-class motor, built for 25 cycles, the operation may be above question, the machine may be considered perfect in its way, but take that same machine and operate it on 15 cycles and you can raise the induction from 25 to 40 per cent, which means that 25 to 40 per cent higher voltage can be applied with the same motor-speed, and you get 25 to 40 per cent greater output from the same motor, or 25 to 40 per cent greater tractive effort can be developed. That in itself is a controlling feature in the question. We have verified it by actual test. For instance, we have taken a 100-hp. 25-cycle motor, and obtained from it 125-hp. at 15 cycles. This motor has good efficiency, good power factor and good commutation on both frequencies, at the above ratings. It is therefore not a question whether the 25-cycle motor will work, for it will work successfully, but it is a question how much more you can get out of it by going to the lower frequency.

It may be questioned that if 15 cycles is better than 25 cycles, why is not still lower frequency recommended? The answer is that at 15 cycles we can practically saturate the machine, which practically fixes the output. At still lower efficiency we could gain in efficiency and power factor, but not much in output; and we lose in other things, such as the speed of turbo-generators and weight of transformers. So there is some point at which a compromise can be made, and it is my opinion, and has been for a long time, that this

compromise is considerably below 25 cycles and should be about 15 cycles. The increased output you can get from a motor at the lower frequency is of advantage principally in getting a smaller number of motors under a locomotive or car, which directly cheapens the cost; or, on a locomotive, keeping the same number of motors, we secure a bigger output for a given weight of locomotive. But there are some cases where we do not gain much by the use of lower frequency. For instance, where it is necessary to operate alternating current—direct current, requiring four motors in order to obtain series-parallel control, in most cases we do not get the full gain from the use of 15 cycles for we cannot reduce the number of motors. That is one of the conditions met in the New Haven railway equipment, for the direct-current operation on the New York end requires the use of four motors. There are many cases, where the power is purchased, in which it is necessary to use the higher frequency. Of course, the results are obtained at a somewhat lesser capacity or at an increased cost.

There is one point which Mr. Stillwell has not touched on, and that is the fact that the single-phase series-motor can be made to operate on both 15 and 25 cycles; for instance, a 25-cycle motor will operate beautifully at 15 cycles and at practically the same speed, because the speed has nothing to do with the frequency, and a 15-cycle motor, if well designed, will operate on 25 cycles fairly well, at its normal capacity, but at slightly reduced capacity will operate very well, so that, for instance, if a locomotive should be equipped with transformers suitable for operating at 15 cycles it could operate on both 25 or 15 cycles very well. By taking a 25-cycle equipment, nominally designed for 25 cycles, and putting a 15-cycle transformer on it, the equipment is adapted for operation on both 25 and 15 cycles. That is important in connection with the fact that 25 cycles will have to be used in a certain number of cases, but in other cases where the generating conditions can be made suitable, 15 cycles will work to better advantage.

In Mr. Stillwell's paper he speaks of some of the advantages of the higher frequency, one of which is the better ratio of tractive effort to weight on drivers. We have been making tests at East Pittsburgh on some electrical locomotives, at both 15 and 25 cycles, and it is very difficult to determine any difference in the ratio of tractive effort to the weight on the drivers. In some cases the tests are possibly in favor of 15 cycles, and in others in favor of 25; and the difference is probably no more than would be found in making two consecutive tests at any one frequency. If the motors are spring-connected or have some flexibility between the armature and the driver, which is true in most cases, especially where they are geared, the difference in the tendency to slip practically disappears.

In discussing this question of 15 cycles, we are asked where it is in use. I will call attention to the fact that quite a number of European companies have adopted 15 cycles for railway work. The Valtellina plant, put in by the Ganz company, with three-phase motors, uses 15 cycles and I feel safe in saying that a great deal of the success and good operation of that plant is due to the choice of this frequency. I think they could have made the apparatus a success with 25 cycles, but it would have required much heavier equipment, and with poorer efficiency and power factor, especially at low speeds. The manufacturers recognized that 15 cycles gave better conditions with the polyphase motors and adopted it regardless of the fact that that was not a standard frequency in Europe. That system is being extended on the Italian roads.

The Oerlikon company, of Switzerland, has gone into the single-phase work extensively, with 15 cycles as a standard. The Siemens-Schuckert company, of Germany, is also manufacturing series railway motors for 15 cycles. The Allgemeine company of Berlin, is the principal company which is adhering to 25 cycles, and that is largely due to its type of motors. They have a so-called "series-repulsion" motor, in which the characteristics of the motor apparently show to better advantage if the frequency is not too low. It is not directly due to the high frequency that they get better results, but to the fact that the motor should preferably run below the nominal synchronous speed and this condition is obtained to better advantage by keeping the frequency up.

Mr. Bion J. Arnold, being introduced by a reference to his pioneer efforts in single-phase work and to the fire which destroyed his first equipment on the eve of actual operation, said: I felt that unless the experimental machine was rebuilt and an attempt made to operate it, I might be misunderstood by my brother engineers, and the machine might be misunderstood. I therefore rebuilt it and operated it some six months later. That experiment cost me about \$50,000, but thanks to my good fortune, it cost no other man

a dollar. I believe I was instrumental in advancing the state of the art to such an extent that we have today two or three of our large railroads being equipped with the single-phase system, invented by others, to be sure, but I believe forwarded by my efforts some four or five years ago. If my efforts have done that, and I have been instrumental in advancing the art, I am glad that I spent the money, as I could not have spent it in any better cause.

As to the paper of the evening, had I had time to read and study it, I would like to discuss it somewhat more fully than I will be able to. However, if I had all the time necessary to study it, I would not attempt to go into a detail analysis of the various systems which are involved in the paper, because I think each system has its able champions, as we have seen indicated here tonight. I am also in a position where it makes no great difference to me personally which system wins, so long as we get a system of electric railroading in this country that we can put on our steam railroads and operate them for less money than we can operate them with steam. That was the principal idea I had in mind in starting out on the single-phase experiment, because in 1898 I was engaged in building the Chicago & Milwaukee Electric Railway, which I believe is considered the pioneer rotary-converter substation installation in the country, possibly in the world, at any rate to be driven by a steam station. I took much risk in that undertaking, risking my personal reputation and my financial resources, in order to demonstrate the success of that enterprise. That was a success, and as you know most of the suburban roads have been built on those lines since. I make no claim for the invention of any of the devices which entered into the systems. They were invented by some of the gentlemen here present and others, and began to come into commercial use, namely, the rotary converter principally, which made the system possible, but I took the responsibilities, engineering and financially, of making it go, and it went. When engaged in that work I felt that was not the complete solution of the electric railway problem, because the introduction of the rotary-converter substation necessitated men in the substations, and necessitated more investment than I thought the railroad systems of the country could stand. If they were to be attracted to electrical operation. That started me on the single-phase idea, and as many of you will recollect, we had various discussions on it and it was stated it could not be done. I maintained it could be done and had to be done, and it cost me money to find that out. It has been done since by at least two companies in this country, and two or three abroad, and seems to be coming into practice quite rapidly for steam railroad work.

I do not know that I agree entirely with the author of the paper that we should standardize at once, and thereby shut out the utilization of the talent and genius of the men who are members of this body and other bodies in this country, and other countries, or the prospect of developing something that may prove better than anything we now have. I am willing to concede, if we are going to use alternating-current railway systems, that it is probable that we should adopt a standard frequency, and so far as my investigation has gone, in conjunction with work with Mr. Stillwell, the Erie Railroad work, my own conclusion is to lean toward the 15-cycle frequency, although I do not want to definitely stand on that now. It seems to me it is the frequency we will come to on account of the fact that to get the requisite amount of capacity between the wheels of railway machines, the gauge being limited, it is necessary to get as much motor in there as possible, and we can do that with the alternating current by adopting 15 cycles and get more than we can with 25 cycles. It makes the weight of the machine practically the same as with 25, as it increases the size of the transformer, but reduces the size of the motor; the net weight is the same, but it gets additional power on the machine and that is what we must get, and we do not get as much power on the wheels with the alternating current as with the direct current. However, I personally believe that some form of high-potential overhead conductor is going to be the final solution of the railway question.

I believe in the third rail, where it is applicable, but I do not believe there are many places where it is applicable; in other words, I think the legislation of this country will come to a point where they will not permit the use of third rail, at any rate in exposed places, and that being the case I think it is up to the electric railway men of this country to begin to get ready to take care of the problem when that sort of legislation comes. There are certain types of third rail recently adopted which I believe are safer than anything adopted before—that, of course, removes a certain amount of objection—I refer to the rail Mr. Sprague is interested in developing for the New York Central work—but I do not

think the use of the third rail in yards and under the feet of men is what we are going to adopt as the final solution of the problem.

In the analysis of the Grand Trunk problem, which I have in charge so far as the engineering decisions are concerned, I chose the alternating-current system, overhead conductor, for tunnel work, for the reason that in the large yards at each end of the tunnel, where much switching is done, it seemed essential that the conductor be kept from under the feet of the men. That decision to use single-phase motors was made some five months prior to the New Haven road's decision to adopt the alternating current on its road.

Mr. W. B. Potter (General Electric Company)—I most heartily endorse the recommendation of the authors of the paper for a more perfect standardization of the systems and apparatus for railway work. The one thing, however, I think we must appreciate, is that standards are ordinarily secured where it does not cost anything to bring them about. So far as the known systems can be considered with respect to the different problems, they have to be considered so far as the railroads are concerned from the standpoint of the cost for each individual case. You could hardly expect that a road contemplating an equipment which would cost, say, \$2,000,000, for the sake of standardization and in anticipation, perhaps, of sometimes effecting a juncture with some other road at some distance, would spend \$3,000,000. Yet that is just what it would mean. That relates particularly to the question as between different systems.

Now, with regard to the question of frequency as affecting alternating single-phase operations, there is no question but that the motor, limited as it is by the space between the wheels, the car body on the clearance over the track, is the device to which all of the rest of the equipment must be subordinated in order to get the best results. A great deal would be involved in the substitution of 15 cycles for 25. It means considerable increase in cost for the generating apparatus, it means a frequency that would not be suitable for lighting the cars, even, and a frequency which for every other use than the single-phase motor itself, and incidentally the conductor system from the generating station to the motor, would possess no advantage. I do not think, however, that we can look for the ultimate development of the single-phase motor on 25 cycles. We can build, it is true, a motor that has good commutation, but it has a relatively small output for its size, weighing something like 25 per cent more than the direct-current motor having corresponding capacity. With 15 cycles, with the same degree of commutation, the motor would probably weigh from 10 to 15 per cent more, only. The efficiency and power factor would both be very much the same.

Mr. Stillwell made some mention of the maximum available tractive effort as between 25 and 15 cycles. Mr. Lamme also spoke of some tests they made in the same connection. The tests which we have made indicate in comparison with direct current,—that is, taking a given motor on direct current, on a truck and raising the car body so that the inertia of the car body or the friction due to its movement would be eliminated—that depending on the condition of rail, testing the same motor with direct current and then with alternating current at 25 cycles, we find that on direct current, assuming, for convenience, the tractive effort to be 100 per cent, on 25 cycles it varies from 80 to 90 per cent, and on 15 cycles from 70 to 80 per cent. The tests have been repeated a number of times, and while perhaps they are in a measure somewhat rough, they seem to be comparatively correct. There is in this connection, however, a fact of interest—that when the motor with direct current slips, the torque is maintained uniformly, the wheel rotates rapidly, and the torque falls off immediately to something like 20 or 30 per cent of the maximum. In alternating current, whether on 25 or 15 cycles, although the wheel slips at a lower point, it only falls off something like 10 or 15 per cent, due to the fact that the slip is a series of progressive or jerks which allow the wheel to grip the rail so that after the wheel has once slipped, it may take hold of the rail and have a higher maximum pull than before it first slipped, by reason of having cleaned off the rail. This is a condition you do not get with direct current. The average draw-bar pull after slipping with alternating current is perhaps 70 per cent greater than it is with direct current. Furthermore, except for freight work where the motor is geared so as to have a high torque per ampere, there is little probability that an alternating-current single-phase locomotive can be built sufficiently light that any one need have fears as to a lack of adhesion on the rails.

The question of 15 cycles is one which I think will have to be considered with respect to some given problem, but it 25 cycles alternating current, or 1,200 volts direct current, or

25 cycles alternating current, or 1200 volts direct current, or 600 volts direct current, should be required by anybody as suitable to meeting every case. Some reference has been made to the high-voltage direct current. I want to say with regard to that type of equipment and also with regard to the 600-volt direct-current motor as well, that motors are possible that are quite beyond the other motor as we commonly know it. We have always looked upon the commutator of the direct-current motor a good deal as a buzz-saw. By the addition of the commutating pole to the ordinary direct-current motor, that is building the ordinary direct-current motor magnetically of the same character as the single-phase motor, sparking at the commutator may be said to be eliminated. For instance, a motor designed for 600 volts can be run—I would not say it should be operated, because the insulation is not provided for that—but it can be run at 1,000 or 1,200 volts without showing any sign of arcing-over or sparking. A 1,200-volt motor would have reasonably the same margin, so that so far as commutation is concerned, there has been an improvement made in the direct-current motor that is comparable to the advance made when the carbon brush was substituted in place of the copper brush. That certainly will have more or less bearing upon the continuation of the use of direct current.

I was going to say a word with regard to the much-maligned third rail. We have not had a chance to malign some of the overhead construction yet, and I think it would be just as well to wait before passing a verdict.

Mr. W. S. Murray (N. Y. N. H. & H. R. R.)—I think the most interesting feature of the discussion is the question as to standardization. I am inclined to believe that the word standardization, although it is a pretty large word, looks to be a good deal larger than it really is. I hardly think the Interstate Commerce Commission reports are a fair basis to be a determining factor as to the establishment of standard frequency. The Interstate Commerce Commission report will include all the trans-continental lines, and there is no question but those lines which have been unassailed yet by electricity could be electrified upon a basis a very great deal cheaper upon the low frequency than upon the high. I do not think that should influence us. It is a misleading factor. We must not forget that the electrification we are going to consider now is in the eastern section of this country. It is possible that all of us may see a trans-continental road electrified. I think it is doubtful and I do not think that ought to influence us in the consideration of standardization. We must think of the fixed charges that have not been taken into account, namely, in the eastern section of the country where it will be necessary to re-equip all these plants and operate upon what may now be termed a standard frequency of 25 cycles. I think for transmission and power 25 cycles is very nearly to standard; the time element involved is the major consideration of our standardization. Our fixed charges can alter, be replaced by a proper depreciation, and after having taken care of those plants that are now operated on a 25-cycle basis, by that depreciation, which is good business and should be combined by engineering, then we can avail ourselves of the greater data which will be at hand and decide which is the standard frequency. We can also interchange these frequencies in operation just as well as the exchange of a station with a different design. It can be done. I have not the time to go into the detail, but I think any engineer can understand what it is to change the operation of any locomotive, so I am in favor of having more data, and in letting the future consideration of those data decide it for us.

Mr. O. S. Lyford (Westinghouse, Church, Kerr & Co.)—On January 22 the Erie Railroad ran its first electric train into Rochester. Power is transmitted 90 miles at 60,000 volts. The catenary trolley over the 34 miles of track is fed with 10,000-volt current from one substation. The operation is perfectly satisfactory. The system is necessarily operated at 25 cycles as the power comes from one of the Niagara Falls plants, which are all built for 25 cycles. The advantage of the lower frequency is apparent, however. Trucks of unusual size are entirely filled with 100-hp. motors. At 15 cycles motors of 150 hp. capacity could be used on the same trucks.

Mr. C. L. du Muratt (Consulting Engineer, New York)—The three-phase locomotive can give a great overload capacity without trouble, and it can give it without any drop in speed. Take a locomotive developing normally 1,500 hp., and motors working at 12 per cent slip, that locomotive can give five times 1,500 hp. with a slip of 10 per cent. If the normal speed is 68 miles per hour, it will drop to 63 miles. The curve of the three-phase locomotive while starting at practically the same traction at low speeds, will run out and then drop down to the maximum speed, for which the loco-

motive is designed. You can see the great advantage which the three-phase locomotive has over the alternating current, and more particularly over the steam locomotive. We might turn the problem around and instead of saying the three-phase locomotive should be able to carry any overload without any drop in speed, where both the direct current and single-phase and steam locomotive drop off, we might say that the three-phase locomotive will carry the same tractive effort up to any speed, from zero up to full-load speed, while the alternating-current locomotive will drop in tractive effort when the speed comes on, and similarly in a steam locomotive.

In concluding, I will convey to you the following general ideas which may be recapitulated as follows: The greatly increased traffic which the railroads have to handle is forcing us to use as high train weights and high speeds as possible. It is therefore quite natural that that locomotive which combines the greatest speed qualities and at the same time the greatest power in the smallest weight is the one which we want to choose for hauling our future traffic. The electric locomotive is quite surely superior to the steam locomotive in this respect, and therefore should be chosen, no matter whether electric service may cost more than steam service. The three-phase alternating-current locomotive is superior to any other electric motor in this respect, and I believe it should deserve more attention than it has thus far found in America.

Mr. N. W. Storer (Westinghouse Electric & Manufacturing Company)—It seems to me that the whole question of the electrification of steam railroads is one of dollars and cents, and a system which can be operated and installed for the least money is going to be the one which is going to win out. As has been said, there are many different ideas on the same question. Many engineers are working on designs of electric locomotives to meet the many adverse requirements. I have worked over them for some time past, and every time it comes up pretty nearly in the same form—the question of frequency, or the question between alternating-current and direct-current operation. It is a question whether the problem can be solved by the simple direct-current system, which our friend, the father of electricity, loves so well, or whether we must go up in the air with our trolley and with our voltage. Our experience is that it generally comes down to the question of a locomotive of the single-phase type. We have considered the direct-current locomotive, the three-phase locomotive, prayerfully and carefully, but it does not seem to us in the Westinghouse company that either one of these is the type of locomotive which will meet the requirements of the railways in this country. The direct-current locomotive as it has been designed certainly will not do it. The single-phase locomotive seems to offer the greatest possibilities. In speed characteristics, the single-phase locomotive, I am bound to say, pleases me much better than the three-phase, for application to electric railways. We can not only operate up to what might be called the normal speed of a locomotive, but you can go far beyond that. It is simply a question of applying higher voltage to the terminals of your motor from the transformer. The same locomotive can just as well be operated at 10, 15, 20 or 25 per cent above what might be called its normal voltage as the direct-current locomotive can be at its normal voltage. The question of commutation is not so much one of voltage as one of induction in the field, one of current which the motor is carrying, or, in other words, of the tractive effort which it is exerting.

There are a few points in the paper which I want to discuss very briefly. The question of frequency is to my mind the most important. Every time the single-phase locomotive is considered for heavy work, it very quickly brings up the question of frequency, which always, or nearly always, results in 15 cycles. It is just this: You can get larger motors within the limited space which you have and you can get at least 30 per cent greater output from your motors with 15 cycles than with 25 cycles. This means that at the limit you must have 30 per cent more motors if you are going to operate on 25 cycles than if you operate on 15 cycles. In the case of two-motor equipments versus four-motor equipments, you have double. There are probably many cases where two-motor equipments of moderate size will meet the requirements so that they will average fully as high a percentage for its locomotives. You then have the same limiting conditions for both, but in one case you have 30 per cent more motors. That not only increases the cost of motors very much, but increases the cost of all mechanical parts; motor trucks must be heavier than trail trucks and the entire equipment necessarily must be heavier. The question of efficiency alone is bound to influence the matter very largely. The 15-cycle motor approximates very closely the efficiency

reached by the direct-current motor, and there is so little difference that it can hardly be detected. In power factor it comes very close to the direct-current motor. You get up above 90 per cent throughout the entire range, in most cases, and that is so good that it is practically unity.

The question of cost of locomotives is mentioned here, the saving in cost which would be expected by using 15 rather than 25 cycles, and I am bound to say that the difference which is shown here in the paper is entirely inadequate to cover what in our opinion would be the difference. I should say that at least \$5,000 would be the difference, rather than \$1,000. That would make a difference which is overwhelmingly in favor of the 15 cycles. That amount would include the transformer and everything on the locomotive. The difference is due largely to the increase of the number of motors. The question of lighting the cars has come up, and I want to say here, as no one else has, I believe, that you can get very satisfactory lighting with 15 cycles by going to the low-voltage lamp having a heavy filament; a lamp designed for 15 volts will give just as good light and as perfect illumination as the ordinary incandescent lamp on 25 cycles. You can scarcely detect a flicker at all, and there will be no question about the lighting of cars. The many other questions which come up in connection with the railway installations will of course influence this matter very largely, but as I stated in the beginning, it is a matter of dollars and cents, whether the 15 cycles is going to be cheaper to operate than the 25.

Mr. William McClellan (Westinghouse, Church, Kerr & Co.)—Having passed through the experience of putting some of these 11,000-volt motors on cars and equipping with them, I am firmly of the opinion that the solution of the railroad problem is going to be by means of the high-voltage overhead trolley, alternating-current, single-phase motor. In spite of the fact that you have to have a heavier motor for the power developed, in spite of the fact that you divide your substation into pieces and carry it around with you, making a large amount of ton-miles in the course of a year, as a whole the system provides a better solution for the trunk line electrification than any other that has been in sight until the present time, particularly if we can bring the engineers to think that 15 cycles is better than 25. I for one after a very careful examination of every argument feel sure that absolutely nothing stands in the way of the standardization of this frequency. I should like to call your attention to one fact, and that is, although the steam railroads have not standardized as to details, they have standardized so that they can exchange cars, and we shall never electrify railroads as a whole until we get so that one railroad can exchange cars and equipment with others. Railroads today do very little exchanging of locomotives, and we might have one kind of trolley on this road running locomotives of one type, and another type here and get along pretty well, and if we cannot exchange cars it will be absolutely impossible for us to electrify the railroads of this country, particularly on the wholesale scale that Mr. Stillwell has suggested in his paper tonight. So therefore I suggest that it would be possible immediately to standardize certain features of our railroad practice, I hope by trolley, as he has suggested, locating the third rail in the almost unknown places where it will be adopted in the future.

But there is one very important thing—while I do not believe, as I will try to show, that the figures given are of very much value, I do believe there are particular lines on which we can approach any railway problem and hope to solve it with electricity, from the fact that we can separate our units and put them in a train, getting very much greater acceleration, which is of great importance in passenger work, or getting longer trains which would help us out in freight work. If we are to do that, it seems we must equip these cars with train lines, and in spite of the fact that the two great manufacturing companies in this country have two different systems in control, I see no reason why the train line should not be standardized and why it would not be possible to have one kind of train line for both systems. Certain things would have to be yielded, but very few. That would solve a great many problems in itself, particularly if the train line could contain the heater and light circuits, making thereby one jumper between the cars to be put in in addition to the albrake hose. That would solve one large factor in the necessary standardization, and I believe the only standardization that is possible or ought to be allowed at present, because anything else would stifle proper advance in the art.

Mr. W. L. Slichter, (General Electric Co.)—Among many interesting parts of the paper of the evening, I have been particularly interested in the subject of discussion of frequency, having studied that subject for 15 and 25 cycles, for single-phase work, and I think there is no question but that the lower frequency is very desirable for the single phase

motor. There seems to be a unanimous opinion that the output of the motor may be increased some 30 to 35 per cent by a decrease in frequency to 15 cycles. This will enable you in many cases to build a motor of sufficient power, in the limited space available on the trucks of a car, to obtain the results desired, whereas at 25 cycles it would be impossible, but we must, as Mr. Stillwell has pointed out, consider what it is going to cost us. The other parts of the system, except the transmission itself, are affected in the reverse way. I have some figures here. I considered first an interurban road in which the number of equipments operating were small compared with what would be considered on a large steam road, as discussed by Messrs. Stillwell and Putnam. For 25 cycles I found that the cost of the power house is 34.5 per cent of the total, substations 2 per cent, low-tension construction 14.8, and low-tension copper 12—I distinguish this because it is possible to save in one and not in another—high tension 5.4, bonding 7, and equipments 25 per cent. Turning to 15 cycles the power house cost was increased to 38, substation to 2.1, low-tension construction remaining the same at 14.8, and due to the lesser losses in the track, the copper could be decreased to obtain the same losses, to 11 per cent; the high-tension construction remained at the same, 5.4, bonding the same at 7, and the total cost of equipments 23, and making the total 1 per cent greater for the 15 cycles. Changing the scene to a road which approximates steam railroad practice, in which the cost of the equipments is increased approximately 100 per cent, with the cost of the power station in proportional increase the figures come out quite otherwise, and very closely as given in the paper, which shows that as we go toward the heavy railroad work there will be more demand for the lower frequency. In figuring these costs I have found that a great deal depends on the design of the generating station. The generator itself may increase in cost from 15 to 50 per cent. This is due to the fact that the speed of 15 cycles is going to be somewhat of a problem in connection with turbine work, whereas with slow speed engine-driven units it is not so much of a problem. It can increase the transformers by 20 per cent, and bring about a decrease in the distributing system of 10 per cent. There is one point that has not been discussed this evening—that although the output of the motor has been increased 35 per cent, that is the output during acceleration, that the continuous output of the motor is not correspondingly increased, and for passenger service with long runs and lesser acceleration, not so much is to be obtained by the lower frequency.

Prof. J. B. Whitehead, Jr., (Johns Hopkins University)—In considering an electrically-propelled vehicle, I take it we may consider that vehicle is best which possesses two characteristics to the greatest degree, other things being equal—you will observe this premise, other things being equal, is the place where all the discussion occurs. The two characteristics to which I refer are the manner in which the vehicle is self-contained and the greatest power that you can get into the space which is given to the motors. In speaking of the degree in which an electrically-propelled vehicle is self-contained, I wish to draw attention to the fact that we may consider an electric locomotive or car self-contained in so far as it requires the least attention from the outside, that is to say, from stationary apparatus. You will readily see the direction in which that thought tends, that is to say, the greater the distance between substations and the less complicated the apparatus at the substations, the better. We at once see the value of alternating current in the greater distance between substations, and the advantage which the alternating current has over the direct current in the substations themselves. I take it that if the advocates of the direct-current system will bring forth apparatus which would transmit and operate at the same voltages that the alternating-current system does, a great deal of this discussion would not have taken place. I think from the standpoint of self-containment we must look for something from the direct-current side before we yield the position taken by the advocates of the alternating current system.

It has been very interesting to hear the comments on the other aspect, that is to say, the great power which can be gotten into the space available for motors by reducing the frequency. If 15 cycles is the point at which the advantages of an increase of power within this space stops, being offset by the greater weight and greater cost of transformers, and the difficulties in the generating apparatus, that is the point where the question is going to stop. The promise I made—other things being equal—are the places where we will have to work. The question is to do the right thing in the right way, and if we can stretch out the distances between the points where the motor needs help from outside more and more, by using the alternating-current system, that is

the direction we will develop. The footnote suggests a danger from the rising potential of a broken bond, in the case of high-potential operation. I ask if there is any instance on record where there have been unpleasant results attendant upon a broken bond?

Mr. L. B. Stillwell—I will reply to Mr. Whitehead's question first, so far as I am able. We have assumed in our estimate the No. 0000 conductor in the return circuit, in order to avoid dangerous potential on the track in case of broken bond. We have not known of any case in which danger has occurred from that cause, but we desire to make our estimates eminently fair to the steam side of this argument and theoretically consider what is an element of risk unless the track return be reinforced.

I have been gratified by the discussion on the paper. I hope the members of the Institute who have concrete facts bearing on the important question of frequency will contribute these facts by letter. I believe that the great majority of engineers present admit that the question of frequency is settled decisively by the testimony we have had in favor of 15 cycles; the testimony of Mr. Lamme, Mr. Storer, Mr. Slichter, and other men who have invented and worked with these motors, to my mind is conclusive in respect to the frequency, and they have testified that the difference in favor of 15 cycles, as measured in drawbar pull, is very great. When you take that fact into consideration, in

A MODERN INTERURBAN LIMITED CAR.

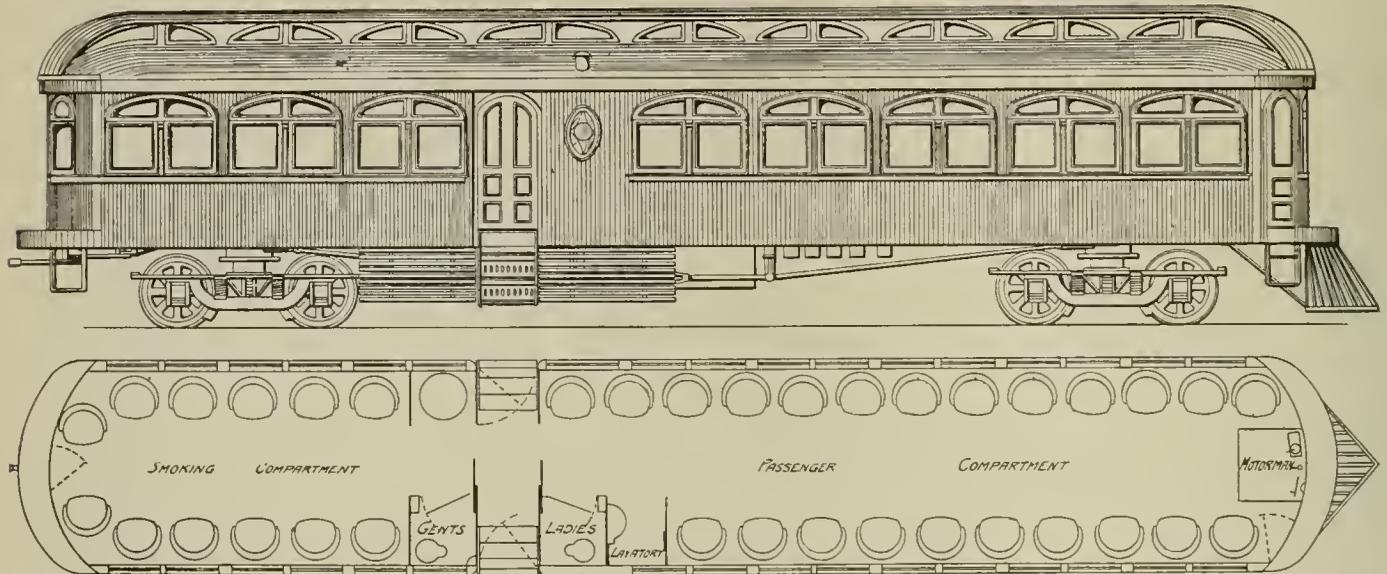

A new design for an interurban car suitable for limited service, as suggested by Mr. H. A. Nicholl, general manager of the Indiana Union Traction Company, is shown in the accompanying illustration. Definite dimensions are not exhibited as the design is intended only as a typical one and the detail dimensions would necessarily have to be worked out in particular for each road that would use such cars. In designing the car Mr. Nicholl had in mind the following advantages to be obtained:

1. It is strictly an observation car, every passenger in it being able to see the track either forward or backward.

2. The arrangement of the passenger compartment is such that women, children and non-smokers, who comprise the majority of passengers in railway cars, can ride in the front of the car instead of at the rear, as is at present in vogue on most railways.

3. It does away with the necessity for women passengers going through the smoking compartment or the smokers being compelled to go through the passenger compartment on entering or leaving the car.

4. There are toilets in both the passenger and smoking compartments and a lavatory in the passenger compartment.

Modern Interurban Limited Car.

view of the general perspective of the problem which I have endeavored to consider, the electrification of the country as a whole, it seems to me there is only one conclusion to draw. In our estimates we calculated the expenditure for rolling stock would be on the 25-cycle apparatus \$450,000,000. Mr. Storer said that the difference in favor of the 15 cycles would be at least \$5,000 per locomotive. Scaling that down to \$4,000, and applying that to 24,000 locomotives, the difference is \$96,000,000, which is ten times the difference in cost of power house equipment. I believe we are able to standardize frequency and the position of the overhead trolley. We certainly ought to do that.

The steam railroads have standardized everything in relation to the interchange of their traffic. We must follow that precedent, or we shall get involved in all sorts of trouble. Mr. Sprague explained why he has not the same kind of station that Mr. Murray has. When they meet at Albany, after having electrified the systems further back into the country, they will have some difficulty in making their systems fit, and that is what we want to avoid. Mr. Sprague has made such a great success in this development of the electrification of trolley and steam railroads, particularly in his invention of the multiple-unit system, I should be sorry to see him make a mistake, and I hope before he nails his flag to the masthead with 1,500 volts on the trolley, he will take into account all the evidence presented tonight and see whether he is right.

[That part of the discussion relating to the comparative cost of operating by steam and electricity will accompany its part of Mr. Stillwell's paper in a later issue.—Eds.]

5. The heater is railed off instead of being put in a cabinet, thus dispensing all of the heat through the car.

6. The car is safer because there is but one exit and one entrance, the doors of which can be closed as in a Pullman car. The front door is intended for the use of the motorman and the small rear door for that of the conductor.

In the planning of this car Mr. Nicholl has incorporated many advanced ideas, well-founded on the policy that every comfort should be afforded the passengers on long runs.

The Twin City Rapid Transit Company, of Minneapolis, Minn., controls and operates the city and suburban street railway lines of Minneapolis and St. Paul, as well as a line of steamboats on Lake Minnetonka. The passenger department of the company has been seeking for some time for a suitable trademark for the system and after examining a great many different designs has finally adopted the one shown in our engraving. This trademark will hereafter be used on all printed matter, blanks, timetables, newspaper advertising and other forms of publicity. It was selected from a large number because of its simplicity and because it would look equally well in all sizes and whether printed in one or more colors. The design represents a Spanish mission window, which is typical of the style of architecture to be used in the company's amusement resort at Big Island Park, on which work is now under way.

MEETING OF THE EXECUTIVE COMMITTEE—AMERICAN STREET AND INTERURBAN RAILWAY ASSOCIATION.

The executive committee of the American Street and Interurban Railway Association met at the office of the association, 60 Wall street, New York, on Monday, January 28. Those in attendance were: John I. Beggs, president; James F. Shaw, second vice-president; Arthur W. Brady, third vice-president; C. L. S. Tingley, president of the Accountants' Association; H. H. Adams, president of the Engineering Association; S. L. Rhoades, president of the Claim Agents' Association, and Secretary B. V. Swenson. First Vice-President C. G. Goodrich and Vice-President W. Caryl Ely expected to be in attendance, but were prevented by business engagements from so doing. Past-President H. H. Vreeland was present by special invitation, as was also the following committee, representing the Manufacturers' Association: President J. H. McGraw, Major H. C. Evans, Howard F. Martin, E. M. Williams and Hugh M. Wilson.

One of the chief objects of the meeting was to consider the question of the time and the place to hold the next annual conventions of the several street and interurban railway associations. Boston, Atlantic City and Norfolk, Va., each extended invitations. Mr. R. H. Sexton, chief of the Bureau of Congresses and Special Events of the Jamestown Exposition, addressed the meeting and explained the advantages which Norfolk would have to offer next fall, during the exposition. His efforts were seconded by Mr. E. H. Hyman, representing the Greater Norfolk League, the City of Norfolk and the Norfolk & Portsmouth Traction Company. A letter was read from Mr. A. T. Bell, president of the Hotel Men's Association of Atlantic City, which set forth in detail the facilities and advantages which Atlantic City had to offer as a convention town. Mr. Bell's letter was supplemented by brief remarks from Mr. C. D. White of the Marlborough-Blenheim Hotel. The situation with regard to Boston, which was explained by Mr. Shaw, is at the present time somewhat indefinite, because it is impossible to determine at once whether or not Mechanic's Hall will be available for exhibition purposes.

It was generally recognized through the discussion of the availability of the several places proposed, that the accommodations for the exhibits would of necessity in a large measure be the determining factor in the selection of a place for the convention. The sentiment of those present was in favor of some Atlantic seaboard city.

In order that the question might be determined carefully, after thorough investigation a committee composed of Mr. J. F. Shaw, Mr. C. L. S. Tingley and Mr. B. V. Swenson, with President John I. Beggs as member ex-officio, was appointed to visit the several places under consideration, in company with a similar committee of three from the Manufacturers' subcommittee. This committee was given full power to act. The names of those who will represent the Manufacturers' Association have not yet been announced.

The committee appointed a few months ago to consider the matter of new offices for the association, reported that rooms in the Engineering Societies building, 29 West Thirty-ninth street, had been selected. These quarters consist of five rooms on the seventh floor, which are admirably suited in every way to the enlarged requirements of the organization. Secretary Swenson expects to move to the new location sometime during February.

President Beggs announced the personnel of several of the standing committees for the American Association for 1907, as follows:

Committee on Membership: H. H. Vreeland, chairman, president New York City Railway Company, New York City; C. S. Sergeant, vice-president, Boston Elevated Railway Company, Boston, Mass.; E. C. Foster, president, New Orleans Railway & Light Company, New Orleans, La.; H. J. Mc-

Gowan, president, Indianapolis Traction & Terminal Company, Indianapolis, Ind.; W. Caryl Ely, president, Ohio Valley Finance Company, Buffalo, N. Y.; James H. McGraw, president, Street Railway Journal, New York City; Hugh M. Wilson, president, Electric Railway Review, Chicago; W. G. Ross, managing director, Montreal Street Railway Company, Montreal; W. A. House, vice-president, United Railways & Electric Company, Baltimore; T. K. Glenn, vice-president, Georgia Railway & Electric Company, Atlanta, Ga.

Committee on Compensation for Carrying U. S. Mail: G. T. Rogers, chairman, Binghamton Railway Company, Binghamton, N. Y.; Capt. Robert McCulloch, vice-president, United Railways Company, of St. Louis, St. Louis, Mo.; Gen. G. H. Harries, vice-president, Washington Railway & Electric Company, Washington, D. C.; P. F. Sullivan, president, Boston & Northern Street Railway Company, Boston, Mass.; A. H. Stanley, general manager, Railway Department, Public Service Corporation of New Jersey, Newark, N. J.; A. H. Ford, vice-president, Birmingham Railway Light & Power Company, Birmingham, Ala.; E. K. Stewart, general manager, Columbus Railway & Light Company, Columbus, O.

Committee on Heavy Electric Traction: Calvert Townley, chairman, vice-president, Consolidated Railway Company, New Haven, Conn.; E. B. Katte, chief engineer electric traction, New York Central Railroad, New York City; L. B. Stillwell, consulting engineer, New York City.

The membership of the other committees, namely: "Promotion of Traffic," "Standard Code of Rules," "Subjects," "Car Wiring," "Standardization," "Insurance," "Municipal Ownership," "Public Relations" and "Welfare of Employees," while selected by President Beggs, is not ready for publication by reason of the fact that acceptances have not been received from all of those requested to serve on these committees.

Secretary Swenson, in an informal report covering the affairs of the association stated that since October 1, 1906, the active membership of the American Street and Interurban Railway Association had increased from 200 to 237 companies and the associate membership from 113 to 156. President Vreeland of the membership committee outlined plans which he had under consideration for an active campaign, looking to the material increase in the membership during the present year. While most of the important street and interurban railways of the country are represented on the membership rolls at the present time, there are a number of smaller but very important roads that have not joined, whose accession to the ranks is very much desired by the officers of the association. The number of associate memberships which might be added is large, in view of the fact that many engineers and manufacturers and people engaged more or less directly in the business of urban and interurban transportation are eligible to associate membership. Secretary Swenson expressed his belief that the number of associate members might easily be made 1,000, and he considered it certain that by the time of the next convention it would be 400.

The secretary estimated that the income of the parent association for the current year would amount to \$26,000, a revenue that would cover the expenditures contemplated under the plan of expansion now animating the association and its allied societies.

President Tingley of the Accountants' Association reported that at a meeting of the executive committee of that organization held in Philadelphia on January 21, the report and discussion on "Depreciation," which occupied an entire day of the Columbus meeting, had been revised and that the Accountants' executive committee recommended its publication in the annual printed report. This suggestion was adopted by the executive committee of the American Association and consequently this very important matter on the vital subject of depreciation will shortly appear in the printed proceedings.

Secretary Swenson explained that owing to the great volume of matter flowing from the deliberations at Columbus, and the time necessary for its proper revision, the print-

ed reports of the four associations had been somewhat delayed. The matter is now in the hands of the printer, however, and it is the secretary's expectation that the reports will be ready for distribution sometime in February. The four reports will aggregate a total of 1,400 pages, octavo, and will be issued in two cloth-bound volumes. One volume will contain the proceedings of the American and the Engineering associations and the other those of the Accountants' and the Claim Agents' associations. Company members will each receive one or more sets of these reports, the number being determined by the amount of the annual dues paid to the association.

The important report on "Municipal Ownership and Public Relations," like that on "Depreciation," above mentioned, will first appear in the official printed report.

It is the expectation of President Beggs that another meeting of the executive committee will be held in three or four months, to further consider and elaborate plans for the conventions of the present year.

ANOTHER SUBWAY PROJECTED FOR BOSTON.

A petition and bill for a subway in Boston between the present Park street station and the Back Bay district in the vicinity of the junction of Beacon street and Commonwealth avenue was presented in the Massachusetts legislature on January 19. The project authorizes the Boston Transit Commission to build a tunnel and subway for the accommodation of the two tracks especially for use by surface cars from Park street under Boston Common, and by such a route as the commission deems best to the new Charles river embankment at or near the Union Boat Club, and thence westerly under the embankment from Charlesgate east and the outlet of the Back Bay Fens basin to the junction above named. The cost of the work would be defrayed by the city of Boston, and a 25-year lease to the Boston Elevated Railway Company is assumed at an annual rental equal to 4.5 per cent of the cost of the subway, which would be called the Embankment subway in distinction to existing and already authorized underground routes.

The object of the bill is to provide improved transit facilities at the west of the city, and it is estimated that on account of the location beneath the Charles river embankment the new line could be built at not over 50 per cent of the cost per mile of any subway heretofore built in Boston. The principal items of expense in the construction of other subways have been the great cost of underpinning buildings, removing gas, water and sewerage pipes and wire conduits, the acquirement of locations for stations, and the constant maintenance of a superstructure by which traffic may be continued in the streets overhead during the time of construction. In building the proposed subway there would be little if any underpinning of buildings, only a few hundred yards of pipes or conduits to reckon with, no purchasing of land for stations and comparatively little maintenance of a superstructure in the streets to accommodate vehicles and surface car traffic. The tunnel portion under the blue clay and bowler clay of Beacon Hill could be driven at comparatively small cost, and no cofferdam would be necessary, as the Charles River Basin Commission is now building one. This commission has made its contracts with reference to the fact that the legislature of 1907 may pass an embankment subway act. The subway would necessarily be waterproofed, but this would be the case with any subway built under Commonwealth avenue or Boylston street. Waterproofing may now be accomplished by suitable cements at moderate expense, especially where the pressure is slight, as would be the case with the embankment subway.

If the proposed subway is authorized and built, it will accommodate a large number of cars collected from Brookline, Brighton, the Newtons, Waltham, Watertown and other suburbs lying immediately at the west of the city.

RESPONSIBILITY FOR TROLLEY INFLATION.

The public agitation which has sprung up in several states, notably New York, New Hampshire and Connecticut, over defects of the state railroad commission, is commendable and cheering in itself. But the cynical guide must be pardoned when one reflects how long this reformatory energy has had to wait, how often warnings have been uttered and exposures made by the so-called "technical" writers but without effect on either the public or the newspapers, and how the sins of omission and commission have gone on until now not a few of them are too late to rectify. These reflections, in the nature of afterthoughts, apply peculiarly to the state of Connecticut where just now there is a sudden and volcanic outburst against stock watering of the street railways. The immediate text is the disclosure of the huge volume of water transmuted into dividend-paying stock by the recent absorption of the Connecticut Railway & Lighting Company. The exposure is far from new. But it happens to be accented by a big deal carrying figures of sensational magnitude. Hence the spectacle of Connecticut newspapers which have been silent on the topic for 15 years, now denouncing trolley inflation and the state railroad commission which countenanced it, in scare headlines and double-leaded editorial type. This process of closing the doors after the escape of the animals has its elements of diversion; but, more seriously, it has some historical hints on trolley inflation in Connecticut which are not the less instructive because typical of other commonwealths.

The first trolley wave struck Connecticut in the year 1888, though as a mild surge; a dead-locked legislature two years later created a law-making hiatus of four years during which no statutory business of any kind was done. It blocked and in a sense dammed up trolley projects until 1892, when they burst on the legislature in a flood. The state was thus measurably the victim of somewhat exceptional conditions. The trolley craze grew to wildfire. Cities and suburbs, farms and the backwoods hailed the new motive force as a mighty local and economic helper. The steam companies at first resisted electric parallels successfully, later in vain. Fiscal aspects and ratios of capitalization were ignored and the state railroad commission continued to be the voluntary cipher that it had been before. Outside capital quick to see the profits of course rushed in, constructing street railways by bonds—often marketed below par—and "bonusing" the stock. It was a veritable trolley saturnalia that lasted almost a decade, during which new charters—if not paralleling steam lines—could be had for the asking, and the first speculators in old horse railroad territory got rich quick.

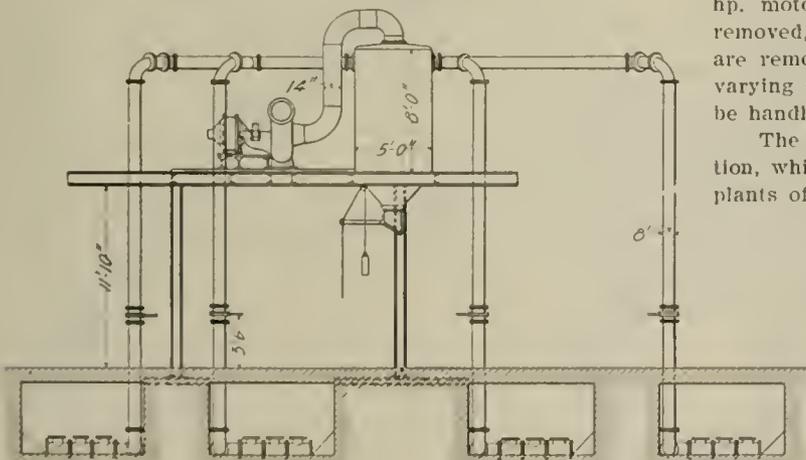

Now too late has come the disillusion. The economic mill, even in so exceptional a thing as the rise of electric street railways, grinds slow but it grinds sure and fine. Connecticut has awakened to a solid economic condition as contrasted with rash and thoughtless enthusiasm. The situation has been forced further by the threatened development of long-distance electric rivalry. This has compelled the steam interests to buy up the dropsical trolley systems one by one until they are now unified under one control, similar conditions existing in Rhode Island and lower Massachusetts. Water original, secondary and in some cases tertiary, is solidified into shares that carry their fixed charge on the purchaser, and, next, on the public. Honest capitalization that might in many cases have connoted a three-cent fare has become diluted capital exacting a five-cent fare. And who is to blame? Obviously the Connecticut citizen who blinded himself both to existing facts and to easy forecast; next a legislature equally negligent, but in which the current of intelligence could hardly be expected to rise above its source; and last, and, on the whole worst, a railroad commission supple, languid and inefficient always, only just now more vividly exposed as such. In other words, all three of the

civic elements charged with the prevention of a public evil were inert when they should have been active.

Where is the redress? Plainly nowhere as regards the past. Connecticut wakes up too late. She has forced her steam interests to self-protection, she has legalized under the signet of her own state officers securities bought by innocent investors, by trustees and savings banks, and she stands committed to a condition which she herself has created and for which she must endure the logical penalty. She has, however, one or two minor offsets. For example, she will gain some tens of thousands in dollars by taxation based on watered stocks enhanced in market value by the new merger and she probably has a few operated trolley lines that would be non-existent had speculative street railway building been at lower terms. For the rest she must "take it out" of a railroad commission made up of two politicians and an antique engineer now in his eighth decade. In the attacks now centering on that body in the Connecticut press one can find retributive justice and a measurable promise of future betterment. As to the general lesson its teachings reach far beyond the bounds of a small New England state which is far from unique in its experience of initial error and belated repentance.—The Railroad Gazette.

PNEUMATIC ASH-CONVEYOR SYSTEM.

In various boiler plants the problem of handling ashes is solved in many ways more or less economical. At the Evanston (Ill.) plant of the North Shore Electric Company

Piping for Pneumatic Ash-Handling System.

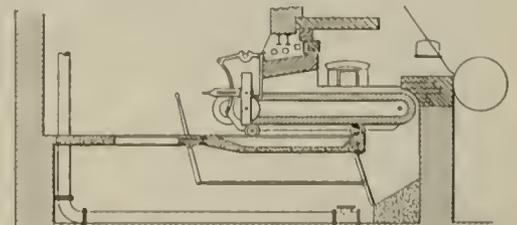

there is a pneumatic ash-conveyor system that has shown itself to be capable of disposing of ashes in a satisfactory and very economical way. The essential parts of this system for pneumatically handling ashes are a No. 7 Sturtevant exhaust fan direct-driven by a 40-hp. motor. A 14-inch pipe connects the fan with the top of a "separator." Leading into this separator are 8-inch wrought iron pipes which extend to the ash pits under the grates where openings are provided for allowing the ashes to pass into the pipes. On account of the expense which would have been necessary to place one ash-collector header through the row of ash pits, as in other installations, it was in this instance thought best to use more piping in the form of risers as shown in the drawing. The separator is mounted between two of the boilers and at the rear, at such an elevation that a wagon may be driven under it and loaded with ashes from a track. The small headroom limited the capacity of this separator to 8,000 cubic feet, but for installations in power plants of more modern design it is proposed to place a concrete ash biner just below the separator so that a large storage capacity may be had.

When it is desired to empty the ash pits the exhaust fan is started, thus creating a vacuum of about one pound per

square inch in the separator and the pipes connected with it. This vacuum rapidly draws the ashes that have accumulated around the openings in the ash pits into the pipes and through them to the separator, where, by means of a spray head and baffles they are wet down and discharged to the bottom of the separator hopper. Blast gates are provided in the lead from each ash pit so that if desired each pit may be cleaned individually. Due to the great difference in velocities of the air, which in the pipes connecting with the ash pit and serving to carry away the ashes is 18,000 feet per minute and in the separator but 500 feet per minute, there is no trouble from ashes passing the separator and damaging the exhaust fan. It is also observed that the ashes travel through the center of the space in the pipes, rather than along the sides. This is due to the greater velocity of the air in the center where the friction is less and thus the pipe work is free from the wear that would ordinarily be expected.

Before this system of handling ashes was installed at the North Shore plant it required four men 10 hours a day to keep the ash pits clean. It was first necessary to go into the hole, shown in the drawing, in front of the boilers and shovel the ashes from their piling place back 12 feet to a point under the hole; then they had to be handled again and thrown onto the boiler-room floor where a third handling was necessary to load them for carrying out of doors. With the new ash-handling equipment one man does the work of the four in one-fifth of the time or two hours; thus, the economy of the installation, which only requires about 25 hp. motor capacity during such times as ashes are being removed, is made apparent. As ordinarily operated the ashes are removed at the rate of 300 pounds per minute and by varying the speed of the motor both ashes and clinkers may be handled in quantities up to 500 pounds per minute.

The cost for handling ashes with this particular installation, which, it is understood, will be much improved upon in plants of later construction, is said to be 5 cents per ton of

A Simple Water Heater.

ashes handled or about 1 cent per ton of Illinois coal burned.

Some of the desirable features other than the low cost for removing ashes are, that with this ash-handling system a fire may be pulled hot and the ash pits cleaned immediately. The exhausting vacuum of one pound per square inch is sufficient to carry to the separator any clinker or fire brick that may pass through the intakes under the boilers. When clinkers pass through the apparatus they are broken into small pieces, making them much more suitable for ballast than as usually found. By means of this same system and a small amount of additional piping it is possible to utilize the same exhaust system for cleaning combustion chambers and the stack.

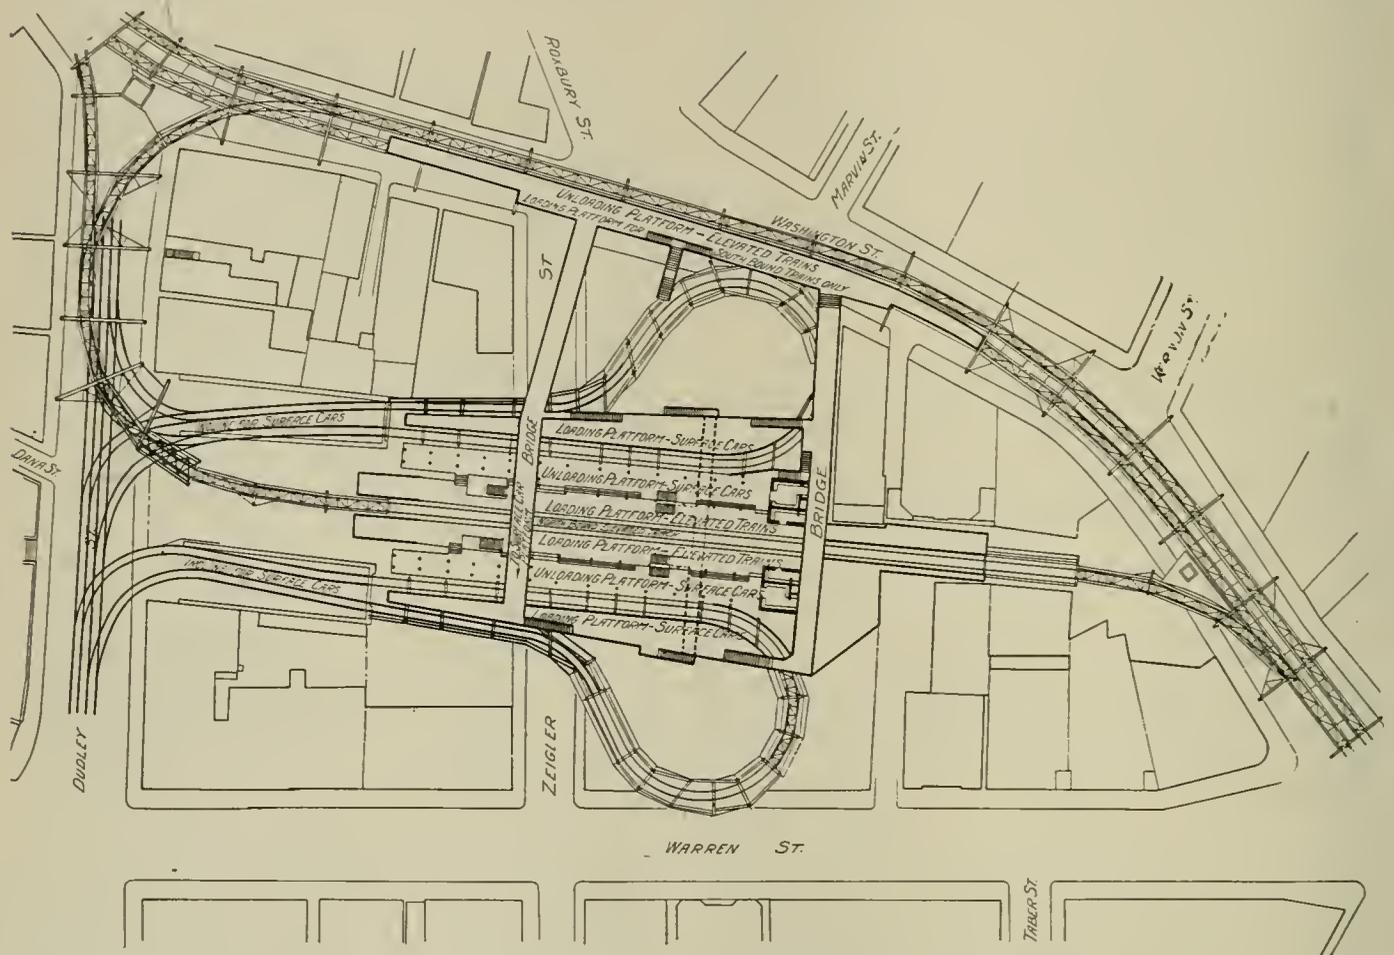

Hot water for the washbowls and shower baths in the shops and offices of the Nashville Railway & Light Company at Nashville, Tenn., is obtained by the simple means of passing the water through about 12 feet of coiled pipe placed in a large Round Oak heater. An explosion is impossible, for, should the water become too hot and form steam, it would simply force the water back into the city mains.

CHANGES AT THE DUDLEY STREET TERMINAL, BOSTON.

The Boston Elevated Railway Company's proposed changes at the Dudley street terminal, Roxbury, have been conditionally approved by the Massachusetts Railroad Commission, final approval being reserved until the mayor of Boston passes upon the plans with respect to the architectural effect and obstruction to light and air. Through the courtesy of Mr. George A. Kimball, chief engineer of elevated construction, we present a general plan of the proposed changes, which are to be made at Dudley street with respect to the extension in progress of the elevated lines to Forest Hills.

At the present time all southbound trains from Dover street station which carry passengers are run through the

the use of the station as a terminal for certain trains if traffic conditions make it desirable. The principal change at Dudley street is in connection with the platform arrangements, which will separate the loading and the unloading traffic in a manner which will doubtless do much to relieve crowding. The new layout involves first of all a new platform 350 feet long over the Washington street side of the terminal, which will serve as a stopping place for south bound trains. This platform will be connected with the main platform in the terminal for north bound trains with one now in use—and with the various surface car platforms lying between and to the east of the others, by two overhead bridges. Two new surface car platforms are planned, one for the inner side of each surface car loop. These loops are connected with the Dudley street level by two inclines, one at the east and the other at the west of the northbound elevated track. South

Plan Showing Proposed Changes at the Dudley Street Station, Boston Elevated Railway Company.

Dudley street terminal by a loop track which turns them back for the northbound trip. Passengers are loaded and unloaded upon the platforms at each side of the train as it stands in the station, and free bodily transfer is given between the train, the cars on the ground level and the lines of surface cars which serve the opposite sides of these platforms at substantially the same level. The longest trains at present consist of five cars, and the only separation of loading and unloading elevated traffic is that accomplished by the use of center doors for exit and end doors for entrance. Eight-car trains will be run at certain times of the day when the new Washington street tunnel route is completed, and at present the elevated stations in Boston are being prepared for this length of train.

The extension of the elevated lines to Forest Hills will in a sense turn the present Dudley street terminal into a way station, although the arrangement of tracks will permit

of the terminal, and not shown by the accompanying illustration, a third track is planned over Washington street, to give an opportunity for switching relay trains into the system with as little interruption to the service as possible.

According to the present plan the west elevated platform over Washington street will be connected with the ground level of the terminal enclosure by a flight of stairs which will enable out-bound passengers to reach the Forest Hills trains quickly from the street, and also will facilitate the exit of passengers from the city to the lower enclosure. The two overhead bridges will bring both southbound trains and surface cars into easy communication. It is planned to use the south bridge chiefly for transferring passengers from outward bound elevated trains stopping at the Washington street platform to the east and west surface car loop loading platforms. Direct stairways are to connect these platforms and the bridge, on each side of the elevated line through the terminal.

Passengers from the city proper, who at present continue their journey by loop cars to Dorchester, Grove Hall, Jamaica Plain, Brookline and other points will be able to make prompt connections by means of the overhead platforms. Passengers arriving at the terminal by surface cars which ascend the inclines will transfer to north bound in-town trains as at present. Trains from Forest Hills will be run through the terminal north bound. The two sets of platforms on each side of the central elevated track are connected by a mezzanine sub-passageway with suitable stairs, between the street level and the elevated level. Passengers from surface points wishing to go to Forest Hills will ascend directly to the north bridge from the surface car unloading platforms, and in general convenient access from any platform to any other can be had by the stairways, bridges or sub passages. The ground level of the terminal will remain as well connected by stairways with the upper level as it is already, with the addition of a stairway to each of the new platforms. Although there are seven platforms and two bridges in the new arrangement it is planned to make each transfer as simple as is possible. Two additional tracks will be installed at the foot of the west incline for surface cars coming from certain eastern points, which at present use the east loop. Exits to the street will be direct and convenient.

THE CHARLESTON & SUMMERVILLE ELECTRIC RAILWAY.

D. E. Baxter & Company, Inc., railroad contractors and engineers, 27 William street, New York, who have the entire contract for the Charleston & Summerville Electric Railway power plant, machinery, overhead work and rail-bonding, have completed specifications for the power and line equipment on which they are pushing construction, having two large gangs at work, one at Charleston and one at Summerville. The operating system is single-phase catenary. The power-house will be situated about nine miles from Charleston at a point where two steam railroads intersect. There will be two Snow gas engines of 800 horsepower with a maximum capacity of 920 horsepower, and two single-phase 25-cycle generators of 600 kilowatts capacity.

From Summerville to Charleston city limits the voltage will be 6,600. At the intersection of the city limits and the company's private right of way will be located a sub-transformer to supply a 550-volt current to the eight single-truck cars intended principally for city use. The south end of the road will enjoy the heaviest traffic in both freight and passenger service, as what are said to be the largest phosphate works in the world and other industries are located along the line. The power-house will be a concrete fireproof building in which will be installed the following named equipment:

- 2 800-horsepower Snow gas engines.
- 2 600-kilowatt single-phase 25-cycle generators.
- 2 70-kilowatt motor-driven exciter sets with transformers.
- 1 switchboard with bus pole at exciter panel.
- 1 lamp bracket and shade.
- 1 field motor
- 2 ammeters.
- 2 rheostat hand wheels.
- 2 double-pole single-throw switches.
- 1 double-pole double-throw switch for throwing battery on either exciter.
- 1 single-pole single-throw equalizer switch.
- 2 circuit-breakers with reverse-current relays for use with field exciter battery.
- Generator panels complete.
- Feeder panels, complete.
- Motor starting panel, complete.
- Exciter regulating battery. The exciter for the rheostat is to have proper range for use with Thrill regulator

The overhead work will consist of a special design single-pole bracket catenary system with 120 foot spans, No. 000 hard-drawn copper trolley wire, corrugated porcelain insulators, suitable stud-bracket, stud strain bracket, section brake and strain insulators.

The president of the company is anxious to complete this

road as soon as possible to take care of the summer travel. A spur will be run from the main line to the new Charleston navy yard. The contractors are increasing their forces that this end may be accomplished, and they are also assured by the Snow Manufacturing Company that the delivery of machinery will be prompt as agreed. This line will have a tendency to increase the population of Summerville, the summer resort for Charleston, as communication between these two points will be of such frequency that the business men of Charleston can reside in Summerville, attending to business and returning to their homes at night.

Power Improvements of the Lake Shore Electric Railway.

During the past season the Lake Shore Electric Railway Company has more than doubled the capacity of its Avon Beach Park power station. The additions include the extension of the south end of the building to accommodate the new machinery necessitated by the increased load caused by the double-tracking of the road from Rocky River to Lorain. A 2,500-kw. Westinghouse-Parsons turbo-generator has been added and is served by a Wheeler condensing outfit and a 67.5 kw. exciter set, also of Westinghouse manufacture. Four 500-hp. Sterling boilers equipped with Sterling furnaces and mechanical stokers have been installed in the boiler-house addition, which also has been fitted with coal and ash-handling and ash-storage facilities.

The track installed is sand-ballasted and the 80-pound T-rails have electrically welded bonds. To make the station a strictly high-tension installation two 400-kw. alternating-current generators have been ordered to replace the present belted direct-current machines, and to provide for the further growth of the business provision has been made for the addition of another 2,000-kw. turbo-generator, exciter, condenser and boilers at the company's power-house at Fremont during the coming summer. The installation of the above equipment and the design of the piping systems, etc., was carried out by the company's engineers.

We are indebted to A. V. Brown, chief engineer of the Avon Beach power plant, for the above information.

Chicago Elevated Railroad Traffic in 1906.

The statement of the traffic of the Chicago elevated railroads in 1906 shows that the four companies carried a total of 131,956,282 passengers, an increase of 8,297,997, or 6.28 per cent, over the year 1905. The growth of travel is counted as being about the normal average for a growing city, but officials of the companies contend that the gains could have been made even greater if the facilities for handling passengers were better. The following data show the number of passengers carried during the year by each of the roads:

	1906.	1905.	Increase.
Metropolitan.....	49,771,816	45,368,837	4,402,979
South Side.....	34,423,601	32,953,607	1,469,994
Northwestern.....	30,397,392	28,238,625	2,068,767
Chicago & Oak Park.....	17,453,473	17,097,216	356,257
Total.....	131,956,282	123,658,285	8,297,997

The significant points in the above are that the Metropolitan showed more gain than all of the other companies combined. The South Side company carried over 4,000,000 more passengers than the Northwestern, but the latter gained more traffic over the previous year than the former. This condition perhaps reflects the superior service of the Chicago City Railway surface lines, which detracted business from the elevated road, compared with inferior transportation furnished by the Chicago Union Traction Company, which lost heavily to the elevated lines on both the West and North sides of the city. Chicago & Oak Park's small increase for the year indicates that the company is doing well to hold its own.—The Economist.

News of the Week

Cleveland Traction Situation.

President H. E. Andrews, of the Cleveland Electric Railway, and President A. B. Du Pont, of the Municipal Traction Company, are still holding conferences in the effort to determine upon a valuation for the property and franchises of the Cleveland Electric Company, which will be made a basis for the proposed lease to the Municipal Traction Company. Attorneys representing both companies and the city were called in last week to assist in the discussion. Mr. Andrews announced that an agreement had been reached on several questions relating to the expiration of franchises. Several contractors and real estate experts have been called in to give advice on the value of the physical property. Secretary Davies of the old company and Mr. Du Pont are still at work on their figures for the amount the Cleveland Electric company is to pay the city, for the use of Central avenue and Quincy streets since the expiration of the franchises. The city council on January 28 extended until next Monday, February 4, the time in which they are to report. The Municipal Traction Company on January 26 announced a novel plan by which it expects to enlist the sympathies of the small investor in the low-fare movement. New stock of the Forest City Railway Company to the amount of \$100,000 is to be issued, in fractional parts of a share. Subscriptions will be taken as low as \$10 a share and no subscription will be taken in excess of \$30. The new issue is to be sold at par instead of at \$90 a share, the figure at which most of the present issue of \$750,000 was sold. This stock will be issued in the name of Fred C. Alber as trustee, who retains the voting power, and will probably be deposited with the banks which receive the subscriptions, as security for the fractional share certificates. The proceeds are to be used for the purchase of new cars and for the construction of extensions. President Du Pont announced on January 28 that he would at once order 50 new cars, to be constructed according to his own designs.

Contract for New York Subways.

The full draft of the contract and specifications for the New York subways was made public on January 24 by the rapid transit commission. In the light of the experiences with the first subway contract many changes have been made.

The contract provides for either construction alone or construction and operation, and is so worded that the contractors will be in every way subject to the control of the city authorities. Before this new contract is finally adopted the commission must hold a public hearing on it and the contract must be approved by the corporation counsel. The contract and specifications as they now stand take up 281 printed pages. The public hearing is to be held on February 7, and it is expected that bids for the Lexington avenue route will be advertised for about a week later. The commission's summary of the contract says in part:

"The specifications provide that the tunnels are to have a height of not less than 13 feet in the clear and a maximum width of 15 feet for each track, except at stations, curves, etc., where the width may be increased. The roof of the tunnels is generally to be as near the surface of streets as street conditions and grades will permit, but will be depressed whenever necessary to avoid grade crossings, as well as where approaching the Harlem river. The roof and sides of the tunnels will be iron or steel and masonry. Entrances to stations will in general be placed within private property, rights in which will be acquired for the purpose.

"Construction is to be generally carried on by means of tunneling or excavation under cover, except as may be otherwise specially provided in the contract, or in places where the board shall give express permission to construct by open excavation. The board has included in the detailed plans for construction provisions for pipe galleries, through and along the principal longitudinal streets.

"The motive power is to be electricity or compressed air, and it is provided that if the operating contractor fails to maintain the rolling stock at a standard demanded by the commission, the board may take possession of the road.

"The use of the subways for advertising purposes, or for any trade, traffic or occupation, other than required for the operation of the railroad, is forbidden."

Then comes this stipulation which gives to the municipal authorities complete supervision over the operation of the new subways:

"If the board shall at any time be of the opinion that any additions to the rolling stock or other equipment, or any additions or changes in stations are necessary, or that additional terminal facilities are required, or that any change in the mode of operating the railroad or conducting its business, is necessary in order to carry out the purposes of this lease, or to promote the security, convenience and accommodation of the public, the board may give notice thereof to the contractor, and at the same time, or at any future time, direct the making of such additions, improvements or changes as the board deems proper.

"If the contractor shall neglect or refuse to comply with the directions contained in such notice, then (without limiting or affecting any other remedy to which the city is or may be entitled), it is hereby agreed that in any legal proceeding instituted by the board or other public authority, either for a forfeiture of this lease, or for damages, or of specific performance, or otherwise to compel compliance with the obligations of the lease, the

burden of proof at all stages of such proceedings shall be upon the contractor to show that such improvements or changes are unjust or unreasonable."

Providence Open Cars to be Vestibuled.—General Manager A. E. Potter has announced that no more open front cars will be run over the tracks of the Rhode Island Company and that the company has decided to place vestibules on every car in operation.

Trolley Freight Plan Delayed.—The Massachusetts railroad commission has withheld its permission to the Boston & Worcester Street Railway to carry light freight and express over its lines because of the phraseology of some of the local grants. The company will at once apply for the required amendments.

Kansas City Viaduct Opened.—The Sixth street toll viaduct, connecting Kansas City, Mo., and Kansas City, Kan., was formally opened on January 30. Several of the lines of the Metropolitan Street Railway will be routed over the viaduct as soon as it is ready for street-car traffic. The viaduct is a steel structure, a mile and three-quarters in length, and was built in seventeen months.

Holyoke Street Railway Increases Wages.—The Holyoke Street Railway Company has announced that it would grant increases in pay to its motormen and conductors, about 200 in number, who petitioned the company recently. The new schedule is as follows: First-year men, \$2.20 a day; second-year men, \$2.25 a day; third-year men, \$2.30 a day; fourth-year men, \$2.35 a day; fifth-year men, \$2.40 a day; sixth-year men, \$2.45 a day; ninth-year men, \$2.50 a day.

More Electric Trains on New York Central.—The New York Central & Hudson River Railroad on January 28 began the operation of electric trains on the Harlem division. Thirty new trains were put into service between the Lexington avenue temporary station and Wakefield. As fast as the new cars are received they will be put into operation. Electric trains have been in operation on the Hudson river division as far as Yonkers for over a month.

Electrification of the Lackawanna Terminal.—The published report that the Delaware Lackawanna & Western is to take up aggressively the work of electrifying its suburban lines into the Hoboken terminal is premature. It has been known for some time that the company had electrification in ultimate view, but this will not be undertaken until the stupendous work of grade elimination, which now after several years is about half completed, is finished.

Proposed Electrification on the Delaware & Hudson.—The Delaware & Hudson has authorized the General Electric Company to make a preliminary investigation to determine the practicability of electrifying 37 miles of the company's line between Wilkesbarre and Carbondale and of operating 30 mines and breakers owned by the company in that region, from the same plant. President Wilcox informs us that the company is not in any way committed to electrification at present.

New Car Line in New York.—The New York City Railway Company on January 28 inaugurated a new car line, to be known as the Fourth Avenue and Williamsburg bridge line. These cars run from the Brooklyn Plaza of the Williamsburg bridge to the Grand Central station without change, and will be of benefit to those living in Brooklyn who are employed on Fourth avenue above Fourteenth street. The line transfers at most of the cross-town lines in Manhattan on the east side and the north and south lines east of Broadway.

To Investigate Freight Carrying by Philadelphia Rapid Transit.—The Philadelphia common council on January 24 adopted a resolution calling upon the street railways committee to investigate the right of the Philadelphia Rapid Transit Company to carry coal, building material, ashes and other freight over its lines in the city streets, which is said to be detrimental to the passenger service. It was urged in opposition that if the company were forced to give up this traffic the congestion of teams in the streets would be seriously increased.

Improvements at Ottawa Beach.—The Toledo Railway & Light Company has awarded a contract for the erection of seven new buildings at the company's new summer resort at Ottawa Beach, which is now being greatly improved for use the coming season. The new buildings include a circular dance hall, a bath house, a dining room, two smaller dining booths, and two lavatories. The buildings are to be built in the colonial style. A contract is to be let later for a two-mile board walk 30 feet in width. Men are now at work on the lagoons.

Bridge Loop Subway.—The New York board of estimate and apportionment voted, on January 24, in favor of a four-track subway loop to connect the Manhattan terminals of the Brooklyn and Williamsburg bridges, to be built by the city. The question of leasing the structure to an operating company will be considered later. This vote of the board of estimate puts an end to the long controversy between the advocates of a subway and those of an elevated structure. The action was taken upon the recommendation of the rapid transit commission. The plan agreed upon is that offered by John B. McDonald, the builder of the present subway, so far as his suggestion referred to Manhattan. It calls for a subway from Park Row and Center street north through Center street to Delancey, thence east to the Clinton street approaches to the Williamsburg bridge, a distance of 7,300 feet. The estimated cost is \$5,245,000, including \$500,000 to be ex-

pended on four stations. Two years and a half will be required for the construction, according to the estimates of the engineers. An alternative proposition for a two-track structure, over the same route, to cost \$2,590,000, was rejected by the board.

Altoona & Logan Valley Issues Monthly Tickets.—Beginning February 1, the Altoona (Pa.) & Logan Valley Electric Railway Company will issue 54-ride non-transferable monthly tickets for the use of its patrons on its lines from Hollidaysburg to Tyrone, Pa., at a 4-cent rate. The tickets are marked for the particular line over which they are to be used and are good for that division only. This will particularly benefit the shop and railroad men who use this company's lines to and from their work. The tickets are sold at the general offices of the company in Altoona.

International Exposition of Safety Devices.—An international exposition of safety devices and industrial hygiene was opened at the American Museum of Natural History in New York city on January 29 and is to continue for two weeks. The exposition has been organized by the American Institute of Social Service, of which Dr. Josiah Strong is president and Mr. Wm. H. Tolman, 257 Fourth avenue, New York city, is director. The aim is to call general public attention to the crying need for better protection to the lives and limbs of the workers in American industries.

Motor Cars on Railways.—Representative Bonwell of the Iowa legislature has introduced a bill requiring that where it is reasonably necessary for the convenience of the public the board of railway commissioners may order any railway corporation to operate motor cars in accordance with a reasonable schedule, considering the requirements of the traffic, upon any part of its line over which not more than one train per day is run in either direction. The measure also requires that where such motor cars shall be run they shall let off and take on passengers between the regular stations.

Technical Literature.—The first number of "Technical Literature," a monthly review of current technical publications, has just been issued. The paper includes a review and index of the more important articles and comment in the various high-class technical publications, reviews and announcements of new technical books, notes from technical societies and colleges, and original articles. It contains 64 pages, well gotten up typographically, and contains several interesting and useful articles on all branches of engineering. "Technical Literature" is published and edited by Harwood Frost, 220 Broadway, New York.

Georgia Railway & Electric Company's New Transportation Building.—The new transportation building of the Georgia Railway & Electric Company, at Atlanta, Ga., which has just been completed, is said to be attracting that attention of the street railway systems of other cities because of some features not generally met with in buildings of this kind. While the structure was planned principally as a clubhouse for the employees of the company and is fitted with a gymnasium containing all modern conveniences, the offices of the division superintendents, starters and other officials will also be located in the building.

Interborough Increases Wages.—The Interborough Rapid Transit Company, of New York city, has announced a voluntary increase in the wages of employees in the station and transportation departments, and the departments of the superintendent of car equipment, master mechanic, chief engineer and superintendent of motive power, effective on February 1. The increase does not apply to conductors until after the third year of service. The increases range from 10 cents to 35 cents per day of 10 or 12 hours, according to the nature of the employment. The increases will add about \$400,000 yearly to the expenses of the company.

Ordinance Requires Seats for All Passengers.—Mayor Mark M. Fagan, of Jersey City, N. J., has signed an ordinance passed by the board of street and water commissioners, providing that all corporations operating trolley cars in the city shall be required to run a sufficient number of cars from their terminals at the Pennsylvania and Erie Railroad depots between the hours of 5:30 p. m. and 7:30 p. m. to furnish with seats all persons from whom fares are demanded. The ordinance also requires that during the evening rush hours persons desiring transportation from these terminals "shall not be kept waiting longer than five minutes." The penalty for each violation of the new regulations is fixed at \$50.

Suit to Compel Steam Road to Establish Joint Rates with Interurban Line.—The complaint of the Cedar Rapids & Iowa City Railway & Light Company against the Chicago & Northwestern Railway, in which the electric line seeks to compel the Northwestern to establish joint through rates, was heard on January 29 before E. E. Clark, of the Interstate Commerce Commission, at Cedar Rapids, Ia. The Cedar Rapids Iowa City operates an interurban line between Cedar Rapids and Iowa City and contended that inasmuch as it receives freight destined to points out of the state and receives freight for points on its line originally shipped from points outside of the Iowa it is engaged in interstate traffic and is entitled to protection under the federal laws. The counsel for the Northwestern took the position that the interurban company cannot claim to be engaged in interstate traffic inasmuch as it is a purely local line, that it is in fact not of sufficient standing as a railroad to entitle it to the same concessions as are granted to other roads, as it has no freight cars of its own but must depend upon the steam roads to furnish same when shipments are made. A brief resume of the complaint of the electric road, as well as of the answer of the Northwestern which were filed with the commission several

weeks ago, was reported in the Review for January 12 page 57. A decision of the commission will be awaited with interest as the question is one of deep importance to electric railway industry and one which will have a widespread influence. No decision will be made by Commissioner Clark, who will take all the testimony before the entire commission, and a decision will probably not be reached for some weeks.

Fire Destroys Chicago Car Barns.—A fire early Thursday morning, January 31, gutted three of the five buildings occupied by the Chicago Union Traction Company on North Clark street, Chicago, including the car barn. Twenty-eight small single-truck motor cars and ten or eleven trailers were destroyed, mostly of an old pattern. A number of cars at the time of the fire were going through the repair shop, which was not injured. Several cars were transferred from the north and west side lines, but the service will be impaired for several days. One hundred new cars are expected from the St. Louis Car Company by February 10. The loss was estimated at \$30,000 on buildings and \$79,000 on rolling stock, a total of about \$110,000, of which about \$78,000 is covered by insurance. The fire followed the explosion of a tank of oil.

Chicago Traction Situation.—Jacob Baur, a small stockholder in the West Chicago Street Railway, has complicated the situation by asking the United States circuit court to enjoin the street railway companies from accepting the proposed ordinances or from taking any further steps looking toward settlement. Judge Peter S. Grosseup and Marshall E. Sampson, clerk of his court, are accused of entering into private negotiations with the city of Chicago in the interests of the company. It is charged that these negotiations have been conducted at the expense of the properties which are in the custody of the court. The bill is directed against all the underlying companies and the receivers. The referendum petition was filed on January 31 with the board of election commissioners and it is expected that the proposed ordinances will be brought before the city council on February 4. Mayor Dunne has secured a legal opinion from Benjamin D. Magruder, formerly justice of the supreme court, and Clarence N. Goodwin which criticises many points in the ordinances. Among other objections they hold that to fix a price for the traction properties amounts substantially to a waiver of the right of condemnation.

Bills to Abolish New York Rapid Transit Commission. Senator Foelker and Assemblyman C. B. Murphy, of Brooklyn, have introduced into the New York legislature a bill in which they seek to carry out the recommendations of Governor Hughes in his inaugural speech in regard to New York city's traction problems. The bill abolishes the present Board of Rapid Transit Railroad Commissioners and provides for a commission to be appointed by the governor to take its place. The new commission is to consist of the mayor and comptroller, as ex-officio members, and seven others, two from Manhattan, two from Brooklyn and one each from the Bronx, Queens and Richmond boroughs. They are to serve for five years and the salary shall be \$6,000 a year. The bill provides that a majority of the board may determine and establish a new railroad route instead of at least six members, as the present rapid transit law provides. Senator McCarren has also introduced a bill to abolish the present commission and to delegate its functions to the present board of estimate.

Side-Entrance Cars for McAdoo Tunnels.—The cars to be used on the Hudson & Manhattan Railway, the so-called McAdoo tunnel system, which it is expected will be in operation between Hoboken, N. J., and New York city by September 1, 1907, will have entrances at each end of the car and midway on the sides. The doors to both end and center entrances will be operated by compressed air under control of the guards at the ends of the car. As separate platforms will be provided for loading and unloading, passengers will enter from one side of the car while those within are leaving from the opposite side. Each car will seat at least 50 passengers, and 250 of these cars are being built. Instead of straps for standing passengers, metal posts will be placed from floor to roof at intervals along the sides of the cars in front of the seats. The floors of the cars will be laid with cement in which will be imbedded strips of carborundum to prevent passengers from slipping. Such a floor can readily be washed clean. It is estimated that the running time from the Hoboken station to Thirty-third street and Sixth avenue, New York city, will be 19 minutes, and from Newark to Thirty-third street, 29 minutes.

Plans for a Municipal Subway for St. Louis.—At the instance of Mayor Wells, of St. Louis, City Counselor Ester is now at work upon the draft of a bill providing for an amendment to the state constitution enabling the city of St. Louis to issue bonds for the construction of a subway. The plans are only tentative as yet and it may be some years before it is decided that the city requires a subway, but it is desired to enact the necessary legislation to make such a step possible. According to the mayor's plans, which he has advanced for discussion, it is proposed to build a subway with the proceeds of an issue of municipal bonds and to lease it to an operating company, at a rental which shall be sufficient to pay the interest on the bonds and leave something for a sinking fund to retire the bond. The mayor has investigated the municipally-owned subways in New York and Boston and believes that a similar system would be suited to the local conditions. Traffic is increasing at such a rate that it is evident that a radical improvement will be necessary at an early date and unless the necessary constitutional amendment is secured this year it would be several years before another opportunity occurs.

Construction News

FRANCHISES.

Columbia City, Ore.—The Seattle Renton & Southern Railway Company has applied for a franchise to extend its line from Rainier boulevard up Ferdinand street to Noble, from Noble to Holmes and from Holmes back to the boulevard line.

Fairfield, Ia.—A franchise has been granted for an electric line from Fairfield to Memphis, Mo. It is reported that this is part of a line which is to be built from Cedar Rapids to St. Louis. Work is to be started at once from Fairfield to Keosauqua, and the line is to be in operation by the first of next year.

Frankfort, Ind.—The Frankfort Delph & Northern Traction Company, which proposes to build an interurban line from Frankfort to Delph by way of Rossville, Edna Mills and Pymont, Ind., has asked for a franchise to enter this city. Right of way has been secured and it is announced that cars will be running within two years. The officers are: A. S. Strauss, Chicago, president; W. H. Cohee, vice-president and general manager; Ed M. Cohee, secretary and treasurer. The directors are: A. S. Strauss, W. H. Cohee, Walter B. Cohee, Ed M. Cohee and E. A. Spray.

Mineral Wells, Tex.—A franchise has been granted to Cicero Smith, Ed E. Dismuke and Marcus M. Bright, Mineral Wells, for an electric line in this city, to be known as the Lakewood Park Electric Street Railway Company. A franchise for an electric road was recently granted to another company, which has completed the foundation for its powerhouse and has part of the track material on the ground.

New Castle, Pa.—The New Castle & New Wilmington Railway Company has applied for a franchise for entrance to the city for an electric line which will connect New Castle and New Wilmington. It is stated that most of the right of way has been secured.

New Iberia, La.—The Bayou Teche Railway & Light Company has been granted the additional franchise asked for about a month ago. This provides for the use of certain streets not specified in the original franchise.

Ogden, Utah.—The Ogden Rapid Transit Company has been granted the 50-year extension asked for a few weeks ago.

Olathe, Kan.—The Missouri & Kansas Interurban Railway Company has been granted a franchise to enter the city and lay its tracks in Park street. The Strang gasoline-electric motor cars will be used and as soon as the additional equipment which has been ordered has been received, 30-minute express service between Olathe and Kansas City will be inaugurated. Package freight will also be handled in addition to the passenger traffic.

Portland, Ore.—The franchise applied for by the Mt. Hood Electric Railway Company has been recommended for passage at a special meeting of the council with the following amendments, which have been accepted by Dr. McCorkle, one of the promoters: At the time of acceptance \$500 shall be paid to the city; during the succeeding nine years \$500 annually shall be paid in advance to the city; during the next 10 years \$1,000 and the following five years \$1,500 a year shall be paid; in three years a continuous line shall be built from the eastern limits of the city 40 miles in the direction of Mt. Hood, 10 miles to be built the first year and the remaining 30 miles in three years; a bond of \$50,000 is to be given as a guarantee for carrying out the provisions of the franchise.

Rochester, N. Y.—Franchises for tracks in several of the streets were sold at public auction on January 25 to the Rochester Railway Company. Permission has been granted by the city council for double-tracking several of the single-track lines and for the laying of new track in certain streets.

INCORPORATIONS.

Bowery Bay Railroad.—Incorporated in New York to operate a street railway three miles long from Woodside to Astoria, N. Y. Capital stock, \$100,000. Directors: Thomas Crimmins, New York City; A. S. Williams and William Richardson, Long Island City.

Central Tunnel Company.—W. D. Bryar, E. B. Hartman, Jr., and William E. Walsh have given notice that they will apply on February 19 for a charter for subway lines in Pittsburg practically paralleling the routes asked by the Pittsburg Subways Company.

Cheektowaga Railway.—Incorporated in New York to build and operate a street railway from Cheektowaga to Buffalo, 5 miles. Capital stock, \$75,000. Incorporators, W. H. Finch, C. E. Williams and H. H. Bennett, of Buffalo.

Fremont Belt Connecting Railway.—Incorporated in Ohio to build an electric line from a point on the line of the Toledo Port Clinton & Lakeside Railway through Salem, Rice, Sandusky and Bellville townships, Ottawa county. This will give access to the new state camp grounds and rifle range near Port Clinton.

South Wilmington & Southern Railroad.—Incorporated in Illinois to build an interurban line from South Wilmington, Grundy county, to Wilson, Livingston county. Capital stock, \$25,000; principal office, Chicago. Incorporators: A. L. Sweet, T. A. Lemmon, Walter Farmer, C. A. Sweet and R. H. Gruschow.

Toledo & Indiana Traction Company.—Incorporated in Indiana as a subsidiary company to the Toledo & Indiana Railway, for the purpose of extending its road from the Ohio-Indiana state line to Kendallville, and eventually to Ft. Wayne, Ind. General manager, E. E. Darrow, Toledo, O.

TRACK AND ROADWAY.

Atlantic Northern & Southern Railway.—It is reported that the various towns through which this road is to pass have subscribed \$100,000 for its construction from Atlantic to Elkhorn, Ia. J. H. Simmons, of Atlanta, is president.

Brooklyn Rapid Transit Company.—It is stated that this company is seeking the approval of the New York rapid transit commission for improvements to its elevated system in Brooklyn at an aggregate cost of about \$6,000,000. The plans provide for a third track in Broadway, from the Williamsburg Bridge Plaza to Fulton street; two extra tracks in Fifth avenue, from Flatbush avenue to Thirty-sixth street; two extra tracks in Fulton street, from Franklin avenue, and two extra tracks in Myrtle avenue, from City Hall to Navy street.

Brownsville Masontown & Smithfield Street Railways.—W. J. Sheldon, president, McKeesport, Pa., writes that this company is being organized and is now seeking a charter for an electric railway from Brownsville to Smithfield, Pa., 20 miles, via Gates, Lambert, Masontown, New Geneva and Point Marion. Surveys are in progress from New Geneva to Brownsville, 16 miles, with 6 miles completed. Grading is to begin in February at Masontown. The company will do the first part of the construction work. The power house is to be located at West Masontown. C. A. Smith, superintendent of construction, Masontown, Pa.

Burlington, Ia.—A movement is on foot to build an electric interurban railway between Bonaparte and Burlington, Ia., a distance of about 43 miles. A G. Roberts, of Bonaparte, is interested.

Chicago & Western Indiana Traction Company.—This company, which was organized and incorporated last year by Edward H. Barrows, of Indianapolis, Ind., has been reorganized by the American Engineering Company, of Indianapolis, which will undertake to complete the road. New officers have been elected, but Mr. Barrows is retained as general manager. The road is chartered to connect Chicago and Louisville through Valparaiso, Lafayette, Crawfordsville, Greencastle and Bloomington; but the first division, that between Lafayette and Greencastle, is all that will be built now. This division will be 57 miles long. This road is known as the "Educational Route," as it passes through four college towns. The company will get its power from the Crawfordsville plant of the Indianapolis Crawfordsville & Western Traction Company. It is stated that financial arrangements for building this section of the line are well advanced.

Cincinnati Northern Traction Company.—An official report from C. A. Alderman, chief engineer, Hamilton, O., states that contracts are to be let within 30 days for grading, bridges, tracklaying and ballasting on its new line between Hamilton and Middletown, O., 9 miles. The company already has a line connecting those towns but desires a new one on a private right of way.

Coldwater & Battle Creek Interurban Railway.—It is stated that financial arrangements have been made for building this road between Coldwater and Battle Creek, Mich., and that construction will start in the spring. The right of way has been secured.

Consolidated Railway.—C. W. Blakeslee & Son, of New Haven, Conn., who have the contract for building the road from Stafford Springs to Crystal Lake, Conn., have also been awarded a contract for building the remainder of the line from Crystal Lake to Rockville.

Corsicana & Palestine Interurban Railway.—Chief Engineer McMichael now has a corps of surveyors in the field locating this line between Corsicana and Palestine, Tex., and it is stated that contracts for the grading will be let in about 60 days.

Dunkirk, N. Y.—There is a report that plans are being made for a trolley line from Jamestown to Dunkirk, N. Y., paralleling the Dunkirk Allegheny Valley & Pittsburg Railroad from Falconer to Dunkirk, and passing through Gerry, Sinclairville, Moons, Cassadaga, Lily Dale, Stockton and Fredonia, a distance of about 35 miles. Surveying is now well under way. It is reported that the Chautauqua Traction Company is interested in the line.

Enid Street Railway.—Two carloads of rails have been delivered for the street railway line in Enid, Okla., which is being built by C. H. Bosler, and construction work is progressing rapidly.

Ft. Wayne & Springfield Railway.—Regular service over this road between Springfield and Decatur, Ind., was started on January 24. The running time is 1 hour and 15 minutes. W. H. Fledderjohann, president and general manager, Decatur, Ind.

Illinois Traction Company.—L. E. Fischer, vice-president and general manager, Danville, Ill., writes that it has been decided to build the line from Springfield to Jacksonville, Ill., but that the exact route has not yet been determined.

International Railway (Buffalo, N. Y.)—This company has applied to the city council of Lockport, N. Y., for a permit to build a double track line on East avenue from Market street to the city limits, to connect its lines with those of the Buffalo Lockport & Rochester Electric Railway, which is building from Rochester to Lockport.

Kenansville, N. C.—It is reported that a movement is under

way to build an electric railway from Kenansville to Hallsville and Chinquapin, N. C., about 15 miles, and possibly a line from Kenansville to either Warsaw or Wallace, N. C. S. S. Grady, of Clinton, N. C., is reported to have made estimates.

Lancaster (O.) Traction & Power Company.—We are officially advised that this company, a consolidation of the Lancaster Traction Company and the Fairfield Traction Company, has made no definite arrangements for extending the line to Buckeye Lake and Logan, O., and that probably nothing will be done this year. Henry B. Peters, of Lancaster, is president.

Marengo Midland Railroad.—This company has been organized at Marengo, Ia., to build an electric railway from Marengo to Millersburg, Ia., with a branch from Millersburg to Fairfield, connecting with the proposed line of the Iowa-Missouri Traction & Power Company to Keosauqua, and another to Oskaloosa; also a line from Marengo to Vinton and Cedar Rapids, making a system of about 150 miles. Marengo capitalists are interested.

Niagara St. Catharines & Toronto Railway.—This company has filed plans for an extension from Ft. Erie to Lundy's Lane, Ont., via Bridgeburg, Willoughby and Stamford. E. F. Seixas, general manager, St. Catharines, Ont.

Northern Texas Traction Company.—H. T. Edgar, of Ft. Worth, manager of this company which proposes to build an Interurban line from Ft. Worth to Cleburne, Tex., 23 miles, states that surveys will be started out at once to locate the line and that if no difficulties are met with in securing the right of way construction will begin at once.

Okanogan Electric Railway.—This company, recently organized to build a line from Nighthawk to Brewster, Wash., on the Columbia river, is advertising for construction materials. A franchise has been granted by the county commissioners and it is stated that surveys will be started as soon as the weather is favorable. The road will handle both freight and passengers. Power is to be generated on Sinchekin creek, about midway between Conconully and Loomis. A. M. Dewey, of Spokane, Wash., is one of the promoters.

Omaha & Nebraska Central Railway.—Chief Engineer W. H. Fuller will start in a few days to make a second survey of the line between Omaha and Hastings, Neb. The company will soon apply for an amended franchise permitting more than one line through Hastings.

Prosser (Wash.) Traction Company.—This company will let contracts about May or June for the construction of a line westward from Prosser, 10 miles and another eastward 35 miles. Surveys will be started at once. Frederick Finn, president; F. A. Jerne, chief engineer; Prosser, Wash.

Raleigh & Durham Passenger & Power Company.—This company, of which B. S. Jerman, of Raleigh, N. C., is president, and T. S. Fuller, of Raleigh, is secretary, proposes to build an electric railway from Raleigh to Durham, N. C., 22 miles. At Durham it will be able to connect with Norfolk & Western, Lynchburg branch; Seaboard Air Line branch, two branches of the Southern, the Durham & Southern and the Durham and South Carolina railroads. At Raleigh it will be able to connect with the main line of the Seaboard, the Raleigh & Pamlico Sound, the Raleigh & Cape Fear and a branch of the Southern. Surveys, maps and profiles have been made by John W. Twigg, Jr., engineer, of Augusta, Ga. No date has been set for the opening of bids.

St. Louis Electric Bridge Company.—Bills have been introduced into congress to authorize the construction of a bridge across the Mississippi river at East St. Louis to give the Illinois Traction System, of which the St. Louis Electric Bridge Company is a subsidiary organization, an entrance into St. Louis.

Scranton Railway.—It is reported that this company will construct a viaduct across Muggler street, Scranton, Pa., at a cost of \$75,000. A. S. Kibbe, chief engineer, Philadelphia, Pa.

South Side Elevated Railway (Chicago).—A third track on the main line from Twelfth to Forty-third streets, work on which was begun about two years ago, has been completed. The work was delayed by a strike of structural iron workers. The new track will be used for express trains. The Englewood extension is now in operation as far as Sixty-third and Halsted streets.

Spokane & Big Bend Railway.—W. H. Plummer, president, announces that this company has made a trackage agreement with the Spokane & Inland Empire Railroad, whereby its cars will enter Spokane over the tracks of the latter, which will build a line from Spokane south to Nine Mile bridge. Mr. Plummer also states that grading will begin at once on a line to Davenport, 37 miles, and that the project has been financed by a St. Louis syndicate, which has taken \$2,500,000 of the company's 10-year 5-per cent bonds, certified by the Spokane Trust Company.

Springfield Wilmington & Cincinnati Traction Company.—James B. Cahoon, vice-president of the Eldenbel Construction Company, of New York, announces that the work of constructing the traction line from Springfield to Cincinnati by way of Wilmington, Clarksburg and Norwood, O., will be commenced as soon as the weather permits. Practically all of the right of way has been secured. Mr. Cahoon states that the company has sold \$1,000,000 worth of bonds to English capitalists, and that the material has been purchased. The road will be 72 miles in length, and cars will make the trip in two hours. A branch will be built from the main line at Cedarville to Xenia.

Toledo & Indiana Railway.—We are officially advised that this company proposes to build an extension from Bryan, O., to Ken-

dallville, Ind., 50 miles, through Edgerton and Melbern, O., and Butler, Waterloo and Corunna, Ind. The Toledo & Indiana Traction Company has been incorporated to build the Indiana end of the line. Surveys have been completed and grading is now in progress. The route is an air line paralleling the Lake Shore & Michigan Southern Railway. A substation is under construction at Edgerton. The overhead work will be of the catenary type. The company now has a line in operation between Toledo and Bryan. S. C. Schenk, president; E. E. Darrow, general manager and chief engineer, Toledo, O.

United Cities Traction Company.—President Ira L. Reeves, Ft. Smith, Ark., is quoted as saying that this company will have its road completed between Ft. Smith, Ark., and Ft. Smith, Okla., by July 1. Grading is now in progress and tracklaying is to begin at an early date. Surveys have been made for a line to Muskogee, I. T.

United Railways.—C. E. Loss, president, of Portland, Ore., is quoted as saying that this company has ordered \$130,000 worth of steel rails for the construction of several city lines in Portland and an Interurban line to Hillsboro and Forest Grove, and that work is to begin as soon as the material, some of which is now in transit, arrives.

Versailles, Ky.—It is reported that W. A. Gaines & Co., of Versailles, proprietors of the "Old Crow" distillery, will build an electric railway four miles long from the distillery to Jett Station on the Louisville & Nashville Railroad.

Vicksburg, Miss.—Frank and George Houston, who have been granted a franchise for an electric railway through the Vicksburg National Park by act of congress, are preparing to take up the various details with the secretary of war. When these details have been arranged it is stated that the contract for constructing the line will be awarded and work begin. It is the intention to begin work early in the spring.

Westfield, Mass.—Surveys are being made for an electric railway from Westfield to Canaan, Mass.

Winnipeg, Man.—Sealed bids for the construction of 24 miles of single-track electric railway, from Lac du Bonnet to Point du Bois, Man., will be received until February 25 at the office of the secretary of the board of control, Winnipeg. Plans and specifications may be seen, after February 1, at the power engineer's office. Each bid must be accompanied by a check for \$5,000 as a guarantee.

York County Traction Company.—W. F. Bay Stewart, of York, Pa., has announced that this company will build an electric line from York to Harrisburg, Pa., via Zion's View, Strlestown and Lewisberg. Surveys have been started and it is stated that the farmers along the line are ready to donate the right of way.

POWER HOUSES AND SUBSTATIONS.

Birmingham Railway Light & Power Company.—It is reported that Ford, Bacon & Davis, of New York, the company's engineers, are considering plans with a view to erecting a large power plant in Birmingham, Ala.

Brooklyn Rapid Transit Company.—It is reported that this company will double the size and capacity of the power house at Kent and Division avenues, Brooklyn, N. Y., and that contracts have been awarded. It is stated that the cost of the work will approximate \$5,500,000.

Evansville Electric Railway.—A new 875-horsepower generator has been installed in the powerhouse at Evansville, Ind. This is the first instalment of \$30,000 worth of improvements to the powerhouse. Extensive improvements are being made to the track on various city lines, and when this work is completed the running time of the cars will be reduced. R. R. Smith, of Evansville, is general manager.

Ft. Dodge Des Moines & Southern Electric Railway.—The substation at Kelly is now completed and the machinery is being installed.

Mobile (Ala.) Light & Railroad Company.—This company will increase the generating capacity of its power house at Mobile by the installation of a 1,200-kilowatt General Electric generator and a 550-horsepower Allis-Chalmers engine. At the time of the recent sale of the company's lighting interests ample boiler capacity to care for this new installation was retained.

Pittsfield Electric Street Railway.—This company has recently put in operation its new power plant on Seymour street, Pittsfield, Mass. Two Hamilton-Corliss engines of 1,000 horse-power each, and General Electric generators have been installed, and the generating apparatus in the old power house on Cottage Row is to be moved to the new plant. P. C. Dolan, manager, Pittsfield, Mass.

Philadelphia Rapid Transit Company.—This company has recently installed in its new power house at Delaware avenue and Laurel street, Philadelphia, a new 6,000-kilowatt turbine generator, which will increase the capacity of the company's power plant about 12½ per cent. Two more generators of the same capacity are to be ordered during the present year.

Public Service Corporation of New Jersey.—It is reported that this company is preparing to double the capacity of its power plant at Trenton, N. J., and that the greater part of the equipment has been ordered. Albert H. Stanley, of Newark, N. J., general superintendent.

Personal Mention

Mr. C. M. Thomas, who was formerly auditor of the Muncie & Portland Traction Company, of Portland, Ind., during the construction period, has opened an office at 1431 Union Trust building, Cincinnati, O., as public accountant.

Mr. Frederick Bushnell has resigned as chief engineer of the Rhode Island Company, of Providence, R. I., which position he has held since 1902, to become connected with the Stone & Webster Engineering Corporation, of Boston, Mass., effective on February 1.

Mr. Lewis Cass Ledyard has resigned as one of the members of the New York Board of Rapid Transit Railroad Commissioners, assigning as a reason that the duties of the office demanded more of his time than he could afford. Mr. Ledyard was appointed by Mayor McClellan last spring to succeed Mr. John Claffin.

Mr. George MacLeod, of Versailles, Ky., has resigned as assistant engineer of the Central Kentucky Traction Company to become chief engineer and assistant general manager of the Lexington Interurban Railways, with headquarters at Lexington, Ky., succeeding Mr. William R. Allen, resigned to accept another position at Norfolk, Va.

Mr. C. W. Chase has resigned his position as secretary and treasurer of the Mobile Light & Railroad Company, of Mobile, Ala., effective on January 15, and will engage in other business at Fort Leavenworth, Kan. Mr. Chase will be succeeded as secretary by Mr. Zerah E. Watson, formerly with the United Railways Company, of St. Louis. The office of treasurer will be filled by Mr. C. N. T. White-Spooner, formerly paymaster for the company.

Mr. Edward J. Davis has resigned his position as general passenger and freight agent of the Columbus Delaware & Marion railway company, Columbus, O., effective on February 1. With the retirement of Mr. Davis this office will be abolished and that of soliciting passenger and freight agent created in its place. The latter position will be filled by Mr. L. W. Harrington, of Columbus, who for the past 10 years has been identified with the Hocking Valley Railway Company. Mr. Harrington has, for some time previous to his present appointment, assisted in adjusting claims for the Columbus Delaware & Marion.

Mr. Edward S. Pattee, who was recently appointed comptroller of the Twin City Rapid Transit Company, of Minneapolis, Minn., in addition to his duties as secretary, has been connected with that company for 15 years. He entered service with the Twin City company as accountant in the stores department and later was made chief clerk in the auditing department under J. F. Calderwood, now vice-president of the Brooklyn Rapid Transit Company. When Mr. Calderwood left the Twin City, Mr. Pattee was appointed auditor to fill his place and in January, 1905, was elected secretary of the company with title of secretary and auditor. In January, 1907, Mr. Pattee was appointed comptroller, with the new title of secretary and comptroller, Mr. D. J. Strouse, Mr. Pattee's first assistant, being promoted to the position of auditor.

Mr. John B. McDonald, who on January 23 was elected vice-president of the Interborough Rapid Transit Company, of New York, with general supervision of the construction of new sub-

ways, was the contractor for the original subway system in New York. He was born in Cork, Ireland, in 1844 and came to the United States at the age of 15, receiving his early education in the public schools. His first engineering work was as inspector of masonry on the tunnel under Park avenue. He became the contractor on the Highbridge branch of the Central of New Jersey and subsequently on the Buffalo extension of the Delaware Lackawanna & Western and the Boston & Hoosac Tunnel. Mr. McDonald did some contracting work in the west and took an active part in the construction work on the West Shore road. A company of which he was the moving spirit built the 1½-mile tunnel of the Baltimore & Ohio

John B. McDonald.

through Baltimore. Mr. McDonald also built the Jerome Park reservoir in New York. His latest important work was the construction of the New York subway, which was completed in October, 1904.

Mr. Leslie Carter, who has been president of the South Side Elevated Railroad, of Chicago, since its reorganization in 1897, on January 31 tendered his resignation, giving as a reason that his duties with other companies required more of his time. He

was then elected chairman of the board of directors. Mr. Marcellus Hopkins, who has been general manager of the road for several years, was elected president and general manager to succeed Mr. Carter. Mr. E. C. Nichols, heretofore attorney for the company, was elected vice-president, succeeding Mr. T. J. Lefens. Mr. Hopkins has had a long experience as a steam railroad man, having entered the service of the Chicago & Northwestern Railway in August, 1863. He worked up through various positions in the operating department and in April, 1893, resigned as division superintendent. He was subsequently receiver of the Chicago & South Side Rapid Transit Railroad, now the South Side Elevated Railway, and was later made general manager, which position he has held to date.

Mr. Edward Payson Bryan, who has been elected president of the Interborough Rapid Transit Company, of New York, was born at Windsor, O., on July 2, 1850. Mr. Bryan received his early education at Granville,

G., in the public schools, at the Granville Academy and Dennison University, preparatory department. He was anxious, however, to get into railroad work and stopped his preparatory course at the age of sixteen to learn telegraphy. He entered railroad service at Lebanon, Ky., on the Louisville & Nashville in 1866 and occupied various positions from telegraph operator to agent at Frankfort, Ky., and in August, 1891, was appointed superintendent of terminals of the Louisville & Nashville at Louisville, Ky., holding that position until March, 1892, when he became superintendent of terminals of the same road at St. Louis, Mo. In November, 1895, he severed his connection with the Louisville & Nashville to accept a position as vice-president and general manager of the Terminal Railroad Association of St. Louis. This position he retained until May 1, 1900, when he was asked to accept the position of vice-president of the Interborough Rapid Transit Company and of the Rapid Transit Subway Construction Company, of New York. Upon accepting this position Mr. Bryan worked out the present plan of organization for the operating force and directed the work of the engineering force which had charge of the equipment of the Interborough lines for operation. Mr. Bryan was elected president of the Interborough Rapid Transit Company on January 23, 1907.

Edward P. Bryan.

Obituary.

T. L. Vanderslice, formerly counsel for the Philadelphia Rapid Transit Company, veteran of the civil war and well known as a corporation lawyer, died suddenly in Philadelphia on January 27, from heart disease, aged 65 years. He was born in Chester county, Pa., near Valley Forge, on July 22, 1841, and was educated in the common schools of Chester and Montgomery counties. For several years he was attorney for the Baltimore & Ohio Railroad.

Springfield Troy & Piqua Increases Wages.—The employes of the Springfield Troy & Piqua Railway, of Springfield, O., have been granted an increase in wages from 20 to 22½ cents an hour.

Cincinnati Street Railway.—The Ohio supreme court has decided that whenever the railway desires to do so it has the right to abandon the portion of its line in Winton place which passes over Winton and Gray roads north of Epworth avenue to the north entrance of Spring Grove Cemetery. The company held that it has the right to abandon this line under a clause of its ordinance. The village and the cemetery association brought suit on the ground that this clause was invalid and asked to have the court force the company to renew the former 15 minute daily schedule.

Suit for Damages Against Chicago Elevated Loop.—Alleging that the operation of elevated trains in Fifth avenue has damaged his buildings to the extent of \$125,000, Henry Strong, a real estate owner, has instituted suit in the superior court for that amount against the Union Elevated Railroad Company and the four elevated railroad companies. Mr. Strong's petition avers that his two buildings situated at 165 and 183-185 and 187 Fifth avenue, are valued at \$300,000 and that since the erection of the elevated structure in April, 1896, the buildings, which are used for offices and mercantile purposes, have been greatly damaged by the vibration caused by the rapid running of the heavy trains past his property. It is contended that because the noise occasioned by the passing trains of cars it is difficult to obtain the most desirable tenants. Because of the erection of large iron girders supporting the structure he fears that if a fire attacked his buildings firemen would be hampered in their work, resulting in great loss to him. The steel columns prevent free ingress and egress of the building, it is declared. The buildings are six-story structures and were erected some years before the elevated loop.

Financial News

American Light & Traction Company.—The directors have declared the regular quarterly dividends of 1½ per cent on the preferred stock and 1¼ per cent on the common stock, payable February 1.

Appleyard Traction Companies.—A. C. Thompson, judge of the United States circuit court at Cincinnati, has issued orders for the final payment of a balance of \$386,966 to holders of claims aggregating \$2,000,000.

Aurora Elgin & Chicago Railroad.—Gross earnings for December, 1906, amounted to \$109,547.30, as compared with \$91,307.75 in December, 1905, an increase of \$9,239.55, or 10.1 per cent. For the six months ending December 31 gross earnings were \$700,089.65, an increase of \$67,896.56, or 10.7 per cent over the corresponding period of 1905. The figures, with comparisons, are as follows:

	December, 1906.	December, 1905.	Six mos., 1906.	Six mos., 1905.
Gross receipts	\$109,547.30	\$91,307.75	\$700,089.65	\$632,193.09
Operating expenses	56,913.04	51,126.40	363,600.99	324,792.05
Net earnings	\$43,634.26	\$40,181.35	\$336,288.66	\$307,401.04
Total interest charges and taxes	26,186.10	24,450.04	156,695.13	146,643.21
Surplus	\$17,448.16	\$15,731.31	\$179,593.53	\$160,757.83

Boston Elevated Railway.—Permission to consolidate with the West End Street railway has been asked from the Massachusetts legislature. The Boston Elevated will issue preferred stock in exchange for West End company stock. The West End company has been operated for eight years under a lease by the Boston company.

Chicago & Western Indiana Traction Company.—The company has been reorganized by the American Engineering Company, of Indianapolis, which it is announced will build the road from Lafayette to Greencastle. Chas. N. Wilson has been elected president and Edward H. Barrows, secretary-treasurer, both of Indianapolis.

Chicago South Bend & Northern Indiana Railway.—This company has been incorporated in Indiana with a capital stock of \$7,500,000, of which \$5,000,000 is common stock and \$2,500,000 preferred stock, to absorb the Northern Indiana Railway, including the street railway systems of South Bend, Goshen, Elkhart, Laporte, Michigan City and Mishawaka, and the lines between Goshen and South Bend and from Laporte to Michigan City. It is announced that the company will build from South Bend to Michigan City and Chicago. It is reported that the interests which formed the company are negotiating for the Chicago Lake Shore & South Bend Company, which is under construction in Laporte county and is to be built from South Bend to Chicago, if the plans of the owners are carried out. The officers of the Chicago South Bend & Northern Indiana are: President, Charles A. Dieterich, New York; vice-president, Charles M. Murdock, Lafayette, Ind.; treasurer, Alfred E. Dieterich, New York; secretary and general manager, Samuel T. Murdock, Lafayette, Ind. The incorporators include Randall Morgan, Philadelphia, and Hugh J. McGowan, Indianapolis, of the Morgan-McGowan syndicate; J. Levering Jones of the Ft. Wayne & Wabash Valley Traction Company, and the Lexington (Ky.) Traction Company; Thomas E. Kratz, of the Evansville (Ind.) traction properties; Joseph Mayer, of the Buffalo & Lake Erie Traction Company, and a number of Indiana associates. The new company has given a trust deed to the Central Trust Company of New York City to secure an issue of \$5,000,000 first mortgage 5 per cent thirty-year bonds. Of the proceeds \$2,150,000 will retire outstanding bonds of the Indiana Railway Company, the La Porte & Michigan City Traction Company and the Northern Indiana Railway Company.

Covington & Southwestern Railroad.—William G. Ruhl, president, has filed official notice with the secretary of state of Indiana of an increase in the capital stock from \$75,000 to \$750,000. The road, it is stated, will be extended to Crawfordsville, Ind.

Forest City Railway.—Additional stock to the amount of \$100,000 to provide for extensions and improvements, has been offered for sale. The authorized issue of capital stock is \$2,000,000 and the balance now offered will bring the total outstanding to \$850,000. The proceeds will be used to finance extensions on the west side principally on Bridge street, Ridge avenue, Gordon avenue and Oak avenue, aggregating four miles of double track.

Grand Rapids (Mich.) Railway.—At the annual meeting Jacob K. Knapp was elected a director to succeed A. G. Hodenpyl of New York. The other directors were re-elected as follows: C. M. Clark, Philadelphia; Lester J. Hodge, John A. Cavade, Jacob K. Knapp, William H. Anderson, Thomas P. Carroll, J. Boyd Pearson, William Judson, Benjamin S. Hanchett all of Grand Rapids.

Hagerstown Railway.—At the annual meeting of stockholders action on the proposition to increase the capital stock from \$200,000 to \$1,000,000 was deferred.

Illinois Traction Company.—December gross earnings amounted to \$32,164.90, an increase over December, 1905, of \$5,984.61 or 24.2 per cent. Net earnings were \$133,385.46, an increase of \$12,267.50 or 11 per cent. For the year 1906 the gross earnings amounted to \$302,174.71, an increase of 24.8 per cent while net

earnings were \$1,361,952.33, an increase of 19.9 per cent. The figures with comparisons are as follows:

	December, 1906.	December, 1905.	Year 1906.	Year 1905.
Gross earnings	\$302,164.90	\$243,180.29	\$3,013,107.74	\$2,414,105.60
Net earnings	133,385.46	120,117.67	1,361,952.33	1,134,968.29

Interborough Rapid Transit Company.—The special franchise tax on the Manhattan Railway for years 1900 and 1905, inclusive, amounting to \$3,170,141.71 has been paid to the city comptroller of New York. There is still pending some litigation regarding the tax on franchises and the Manhattan company filed a formal protest to protect its rights. The payment, however, disposes finally of the claim of the city against the property and special franchises of the company.

Interstate Railways Company.—John A. Rigg, the president, announces that the Philadelphia Bristol & Trenton Street Railway Company has been purchased. The Interstate Railways Company owns practically the entire stock of the United Power & Transportation Company. It is announced that a line will be built over the Delaware river at Morrisville to connect the Philadelphia Bristol & Trenton with the Trenton (N. J.) Street Railway Company, which is controlled by the same interests.

Kansas City Railway & Light Company.—Gross earnings for December amounted to \$499,631 as compared with \$447,798 in December, 1905, an increase of \$51,833 or 11.5 per cent. Operating expenses were \$244,102 against \$211,183, an increase of \$32,919 or 15.5 per cent. After the payment of taxes and interest, the surplus amounted to \$107,637, an increase of \$9,460 or 9.6 per cent. Gross earnings for the seven months ended December 31 amounted to \$3,372,621, an increase of \$328,583 or 10.7 per cent. Operating expenses were \$1,658,722, as compared with \$1,474,580, increase of \$184,142 or 12.4 per cent. The final surplus after the payment of taxes and interest was \$696,282, a gain of \$85,722 or 14 per cent over the corresponding period of the previous year.

Lebanon-Thorntown Traction Company.—The stockholders have elected the following officers and directors: President, J. W. Dempsey, Maistee, Mich.; vice-president, Robert P. Woods, Indianapolis; secretary-treasurer, Frank M. Reed, Indianapolis; directors, J. W. Dempsey, Robert P. Woods, F. M. Reed, Mrs. A. S. Atkinson and Mrs. B. D. Woods.

Lexington & Interurban Railway.—The annual meeting was held on January 22 at Camden, N. J., and the following directors were elected: Louis Des Cognets, Joseph M. Skain, J. R. Morton, R. C. Stoll, D. F. Frazee, W. J. Loughridge, Desha Breckinridge, J. C. Noel, George H. B. Martin, J. Levering Jones, Frederick T. Chandler, Percy M. Chandler, Richard Y. Cook, Bayard Henry, H. J. Delaney, John Blair McFee and Samuel T. Burdick.

Lima Electric Railway & Light Company.—Sult has been started by the city solicitor to set aside a franchise giving permission to the company to operate on Bellefontaine avenue.

Lowell & Fitchburg Street Railway.—Permission has been granted by the Massachusetts railroad commissioners to issue \$75,000 additional capital stock to be used in taking up floating debt and for additions and improvements.

Memphis Street Railway.—George M. Clark, John Brand and R. P. Halleck, who own 175 shares, have asked for a receiver and an injunction to restrain the proposed merger with the American Cities Railway & Light Company, a holding company chartered under New Jersey laws.

Menominee & Marinette Light & Traction Company.—At the annual meeting on January 14, the following officers were elected: President, Augustus Spies; vice-president, S. M. Stephenson; secretary and manager, Edward Daniel, all of Menominee, Mich.; treasurer, Harry J. Brown, Marinette, Wis. The directors are: Augustus Spies, S. M. Stephenson, R. F. Goodman, G. A. Bleach, W. S. Carpenter, R. C. Merryman, Harry J. Brown and Frank A. Spies.

Metropolitan West Side Elevated Railway.—A quarterly dividend of ¾ of 1 per cent has been declared on the preferred stock payable on March 20. No dividends have been paid since February 28, 1903. In the interval earnings have been devoted to improvement of the property.

Milwaukee Electric Railway & Light Company.—The annual meeting has been adjourned from January 21 to February 1. The annual report for 1906 filed with the city comptroller of Milwaukee shows gross earnings for the year from the railway department of \$2,973,443.17. The report of the Milwaukee Light Heat & Traction Company shows gross earnings of \$605,583.97.

New London & East Lyme Street Railway.—Application will be made to the Connecticut legislature for authority to extend from New Britain to the Connecticut River, to increase the authorized capital stock to \$600,000 and to extend feed wires beneath the Connecticut river to a connection with the Shore Line Electric Railway.

Newtown Electric Street Railway.—The property has been sold under foreclosure to A. J. Speece, of Philadelphia.

Norfolk & Portsmouth Traction Company.—It is reported that this company will purchase the Bay Shore Terminal Company which has been in the hands of receivers for over three years.

Philadelphia Rapid Transit Company.—The Street Car Service Committee of the Trades League has raised objection to the plan submitted by the Retail Merchants' Association for settlement of the traction problem and will submit a plan of its own. The

Rapid Transit Company favored an adoption of the merchants' plan, but it was thought best to take no definite action until the Trades League was heard from. The municipal authorities may formulate still another plan.

Ottawa (Ont.) Electric Railway.—Gross earnings for the year 1906 compare with previous reports as follows:

	1906	1905	1904	1903
Gross receipts	\$525,746.50	\$449,633.97	\$384,939.54	\$348,888.78
Total expenses (including mileage payments and bond interest)	345,062.23	305,757.57	275,840.98	254,346.96
Net profit	180,684.26	143,876.40	109,098.66	94,541.82
Passengers carried	11,408,422	9,891,311	8,717,205	7,911,718
Percentage of operating expenses to receipts	57 8-10	59 4-10	62	61 8-10

T. Ahearn, the president, says in his report: "The tracks on Sussex street and Gladstone avenue will be re-laid with heavy rails this year.

"A number of closed and open cars were added to the company's equipment, and additional cars have been ordered to meet the demands of increasing traffic.

"The popularity of the company's park at Britannia-on-the-Bay was further demonstrated during the whole year. It is intended to pave the promenade of the main pier with asphalt or bitulithic, and to extend its outer end a distance of 150 feet."

Portsmouth Street Railroad & Light Company.—At the recent annual meeting the following officers were re-elected: President, Levi D. York; vice-president and general manager, Raymond D. York; secretary and treasurer, H. H. Higgins, all of Portsmouth, O.

Rochester Syracuse & Eastern Railroad.—Permission has been given by the State Railroad Commission to issue \$3,000,000 first mortgage 5 per cent bonds to pay for an extension to Syracuse and for other purposes. These bonds are part of an authorized issue of \$7,500,000, of which \$2,000,000 have been issued previously.

Stark Electric Railroad.—The officers and directors were re-elected at the annual meeting of stockholders, as follows: President, C. R. Morley, vice-president, David Morison; secretary, E. S. Cook; treasurer, E. Wiebenson; directors, the officers and Frank Strauss, William Grief and R. A. Brown.

Toledo & Western Railroad.—The company has taken over the Adrian (Mich.) Street Railway and will it is announced, improve the property.

Toledo Port Clinton & Lakeside Electric Railway.—The following directors have been elected: A. A. Klauser, Theodore Schmidt, H. R. Klauser, G. W. Luckey, E. A. Powers, L. E. Flory, William Miller.

United Railways Company of St. Louis.—For the year 1906 gross earnings amounted to \$9,113,622, a gain of \$683,307 over the previous year, or 8.1 per cent. Operating expenses increased \$209,124, leaving an increase in net earnings for the year of \$474,183. The figures for December and for the year 1906, are as follows:

	December, 1906.	Year 1906.
Gross earnings	\$780,823	\$9,113,622
Operating expenses	397,198	4,623,990
Net earnings	\$383,625	\$4,489,632
Taxes	27,351	487,741
Surplus	\$356,274	\$4,001,891
Other income	1,692	32,726
Total income	\$357,966	\$4,034,618
Fixed charges	198,026	2,377,477
Balance	\$159,940	\$1,657,141
Depreciation	39,041	455,681
Balance for dividends	\$120,898	\$1,201,460
Preferred dividends	54,097	649,160
Surplus	\$66,801	\$552,300

The stockholders re-elected at the annual meeting the following directors: John I. Beggs, James Campbell, Murray Carleton, Robert McCulloch, C. H. Huttig, H. S. Priest, W. V. N. Powelson, Festus J. Wade, St. Louis; George R. Sheldon, C. W. Wetmore and C. D. Smithers, New York.

Washington, D. C., Railway & Electric Company.—At the annual meeting in Washington on January 19 the following officers were re-elected: Allen L. McDermott, president; George H. Harries, vice-president; H. F. Ham, treasurer and assistant secretary, and Frederick J. Whitehead, secretary and assistant treasurer. The directors, who were all re-elected, are: Allan L. McDermott, George W. Young, George H. Harries, George Truesdell, R. T. W. Duke, Jr., John T. Dawson, and James B. Lackey.

Western Ohio Railway.—Gross earnings for the six months ended on November 30 were \$219,461.88, and operating expenses were \$115,117.87, leaving net earnings of \$104,344.01. The percentage of operating expenses to gross earnings was 52.4.

Wilkesbarre & Wyoming Valley Traction Company.—At the recent annual meeting, President John A. Rigg, of Philadelphia, and the other officers and directors were re-elected.

Winnipeg Electric Street Railway.—The following directors were re-elected at the annual meeting: Sir William Van Horne, William McKenzie, William Whyte, D. D. Mann, A. M. Nanton, D. B. Hanna, G. Morton Morse, R. J. Mackenzie and Hugh Sutherland.

Manufactures and Supplies

ROLLING STOCK.

Butler Passenger Railway, Butler, Pa., has placed an order for one single-truck car.

Coal Belt Electric Railway, Marion, Ill., has ordered three large cars from the St. Louis Car Company.

Jacksonville Electric Company, Jacksonville, Fla., has ordered eight double-truck cars from the J. G. Brill Company.

Toledo & Western Railway, Toledo, O., has ordered 2 double-truck interurban cars from the Niles Car & Manufacturing Company.

Omaha & Council Bluffs Street Railway, Omaha, Neb., will place an order shortly for 35 heavy double-truck cars for delivery about September 1.

Pennsylvania is reported to have ordered 21 passenger coaches for use on its West Jersey & Seashore line. The cars will be driven by 200-horsepower motors.

Brooklyn Rapid Transit Company, Brooklyn, N. Y., has prepared specifications for 100 elevated cars in addition to the 100 surface cars mentioned in our issue of January 12.

Forest City Railway, Cleveland, O., has announced through A. E. Du Pont, president, that it will at once order 50 new cars for city service, a special feature of which will be a large rear platform.

Northern Electric Company, Chico, Cal., has ordered from the Niles Car & Manufacturing Company, 10 interurban cars 56 feet in length; from the St. Louis Car Company, 4 interurban cars 56 feet long and from the Cincinnati Car Company 3 combination interurban cars 56 feet in length.

Spokane & Inland Empire System, Spokane, Wash., will soon place orders for 12 Brill type passenger coaches and 50 flat cars. An order has been placed with the Seattle Car & Manufacturing Company for 250 box cars 40 feet in length and of 80,000 pounds capacity for delivery prior to July 31, 1907.

SHOPS AND BUILDINGS.

Richmond & Chesapeake Bay Railway.—This company has let a contract to W. A. Chesterman for the construction of a terminal station, 67 by 146 feet, at Broad and Laurel streets, Richmond, Va., to be completed by May 22. The station is to be of light brick, with stone base and metal cornices. Noland & Baskerville are the architects. C. P. E. Burgwyn, chief engineer, Richmond, Va.

Tacoma Railway & Power Company.—This company is erecting five passenger stations along its American Lake line, between South Tacoma and the lake. The stations will be 16 by 20 feet, of the bungalow type.

TRADE NOTES.

John Davis Company, of Chicago, has just shipped three 26-inch and two 22-inch "Hochfeldt Eclipse" relief valves to one of the Utah Copper Company's plants of the American Smelters Securities Company, at Salt Lake City, Utah.

Vulcan Iron Works Company, Toledo, O., has received an order from the Washington Baltimore & Annapolis Electric Railroad for a large steam shovel and from the Wisconsin Central for a 60-ton steam shovel for work at Prentiss Junction, Wis.

John B. Watson, Philadelphia, has taken larger offices and moved from 515 to 531 Drexel building. Mr. Watson is well known in the contractors' equipment line, making a specialty of second hand steam shovels, locomotives, cars and relaying rails.

Westinghouse Electric & Manufacturing Company, Pittsburg, has had plans prepared for a warehouse to be built at the north-east corner of Morgan and Thirty-sixth streets, Chicago. It will be a 4-story structure, 80 by 100 feet, of fireproof steel construction, concrete foundation with concrete and brick exterior, steam heat and to cost \$75,000.

Otto Raymond Barnett, 1515 Monadnock Block, Chicago, will succeed the firm of Raymond & Barnett which was dissolved on January 11 on account of the death of James Henry Raymond. Mr. Barnett will make a specialty of the law of patents, trade marks, corporations and copyrights, being assisted by Parker H. Truman, formerly with the firm of Parker & Carter.

H. Walton Heegstra, for some time past advertising manager of the Western Electric Company, has severed his connection with that company. Mr. Heegstra's experience with all branches of advertising covers a period of eight years, most of which time was spent in the east. His broad experience will doubtless enable him to form a connection of mutual advantage.

O. M. Edwards Company, of Syracuse, N. Y., maker of the Edwards Window fixtures, shade rollers, sash balances and extension platforms, has outgrown its own quarters and has moved into a new building erected for its sole use. The new structure is built on what is known as the Salt Lands, which has been a government reservation and is practically in the heart of the city. It is close to all of the railway lines entering the town. The plant

has 150,000 square feet of floor space and is one of the most complete in the country, devoted to the making of railway supplies, the products requiring as widely varying departments as those of sewing room and a brass foundry. All the buildings and fittings are of the latest design, being thoroughly fireproof and fitted with the most modern machinery.

Lord Electric Company, 904 Fuller Building, New York City, installed about 18 months ago several hundred soldered bonds on the track of the International Railway Company, of Buffalo. A number of these bonds were recently subjected to test by H. L. Mack, superintendent of line of the International Railway Company, and were found to be in perfect condition.

American Car & Foundry Company has had plans prepared by Baxter & O'Dell, 1024 Hammond building, Detroit, Mich., for a millwright shop to be erected at the corner of Ferry avenue and Russell street, Detroit. This will be a 3-story and basement building, 40 by 80 feet, of brick construction, with Bedford limestone trimmings, composition roof and electric lighting. Bids will be received by Baxter & O'Dell.

Fairbanks, Morse & Co., Chicago, manufacturers of gas, gasoline and electric engines, hand cars, etc., have purchased property at Ninth and Harney streets, Omaha, Neb., upon which they propose to erect a warehouse. It will be a 6-story building, 66 by 132 feet, of concrete construction and is estimated to cost \$80,000. W. F. Norman, 1102 Farnam street, Omaha, who is the manager of the Omaha office of this company, will have charge of the work.

F. P. Harrison Electric & Manufacturing Company, of New York, has just sent a large shipment of Deltabeston armature and field coils to the Yorkshire Tramways Company, Liversedge, England, and another shipment to the Australian Natal Government, Sidney, Australia. The company has also received a large order for Deltabeston armature and field coils, amounting to more than \$6,000, from the Pacific Electric Railway Company, Los Angeles, Cal.

Advance Equipment Company, Incorporated, West End Trust building, Philadelphia, makes a specialty of furnishing contractors plant, both new and second hand and is in position to furnish materials promptly. The company handles the Monarch Road Roller Company's products. This road roller passes the specifications and requirements of the state engineers and the highway department officials of many states. It also represents in the east the Municipal Engineering & Contracting Company, manufacturers of the Chicago Improved cube concrete mixer.

ADVERTISING LITERATURE.

Crandall Packing Company, Palmyra, N. Y.—A complete catalogue and price list of the improved steam, ammonia and hydraulic packings manufactured by this company is presented in an 80-page publication.

Abrasive Material Company, Philadelphia, Pa.—A substantial catalogue has been issued by this company for use during 1907. It presents information about the grinding wheels made by the company together with many useful tables for the machinist and drawings of various types of special wheels made by this company for industrial concerns.

Ball Engine Company, Erie, Pa.—A small pamphlet issued by this company calls attention to the fact that this is the twenty-fifth year of its existence and describes a number of the engines manufactured by it. One of these engines is a Corliss with patented valve motion with low clearances, by means of which economy is obtained and a high rotative speed is permitted.

Crescent Machine Company, 42 Main St., Leetonia, O.—The latest catalogue of this company presents a full list with an adequate description of its various wood-working machines. One of the types, a 32-inch band saw, has recently been redesigned and a number of new features added. The machine is made particularly for general planing mill use and the company states that it has proven satisfactory in general service.

Hayes Track Appliance Company, Geneva, N. Y.—This company manufactures lifting derails, a distinctive pattern of a device which is essential for the protection of the grade crossings of one railroad by another and as a safeguard in other instances. The company has recently made a number of improvements in the models of its device and an eight-page illustrated pamphlet tells what the improvements are and why they improve.

Wallace-Coates Engineering Company, Inc., 355 Dearborn street, Chicago.—A well-printed and neatly-arranged pamphlet of this company outlines its organization and scope of work. The executive committee includes Harold F. Wallace, formerly chief engineer of the Illinois Central Railroad and third vice-president J. G. White & Co., New York; Frank R. Coates, formerly chief engineer Chicago Great Western Railway and vice-president Thomas Phee Company, general contractors; John Findley Wallace, president Electric Properties Company, New York, formerly general manager Illinois Central Railroad and chief engineer Panama Canal; Pliny B. Smith, attorney-at-law, and Theodore W. Snow, president Otto Gas Engine Company. This company makes examinations, reports and supervises investments for banks and trust companies; makes examinations and reports on proposed and existing lines and terminals for steam and electrical railway companies; makes examinations and reports for construction companies and on public service utilities for municipalities. Another phase of the company's work is analytical examination of expenses for steam railroads, electric railways and construction companies.

ADDITIONAL EQUIPMENT FOR THE WEST JERSEY & SEASHORE.

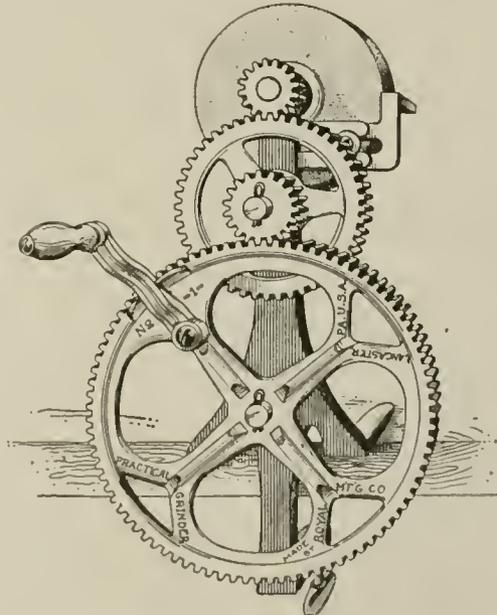

Because of the increased traffic on the Camden-Atlantic City electric line, it has become necessary to add to the present rolling stock some 21 cars. Both the new cars and the generating apparatus necessary to care for the extra load, are similar to the present equipment. Each of the cars will be driven by a GE-69 (200-hp.) double motor equipment and will be fitted with the Sprague-General Electric Type-M control.

At the Westville power house a fourth 2,000-kw., 6,600-volt, 25-cycle, three-phase, Curtis steam turbo-generator will be installed. Additional boiler capacity with the necessary condenser and feed pumps, switchboards, etc., will also form a part of the new equipment, as well as a 75-kw., 125-volt, horizontal Curtis steam turbo-generator for excitation purposes. Three extra 700-kw., air-blast transformers will step up the generator voltage to 33,000 volts for transmission.

Six 1,000-kw. rotary converters will be distributed in the substations. The accompanying air-blast transformers for these machines have a capacity of 370 kw. each, three being installed with each rotary. The Pennsylvania Railroad has ordered all the additional apparatus, as outlined, from the General Electric Company, which also furnished and installed the initial equipment.

A PRACTICAL GRINDER.

The compact and durable grinding machine illustrated herewith is designed for a great variety of uses and in various sizes according to the nature of the work to be done. Its portability makes it of value as a time saver where tools and drills requiring constant sharpening are in use. The grinding wheel is of aluminum, manufactured by the Norton Grinding Company. The frame is of cast-iron, designed for strength, and the spindles are of

Practical Tool Grinder.

cold rolled steel. Each wheel can be removed and easily replaced in case of breakage. A speed of 300 revolutions per minute can be obtained, insuring rapid cutting, and it is said that its work is ten times as rapid as that of a grindstone.

The manufacturer, the Royal Manufacturing Company, Lancaster, Pa., states that the machine has been found especially useful in electric railway shop and maintenance of way work, and one superintendent states that the grinders paid for themselves in two weeks. The same type of machine is arranged for foot-power by the attachment of a treadle and mounting a fly-wheel on the grinding-disc shaft.

THE USE OF DOSSERT JOINTS.

Dossert & Co., of New York City, were exhibitors at the recent electrical trades exposition in Chicago. This company manufactures solderless connectors for making all manner of electrical joints between cables and soldered wires. Mr. E. A. Dossert acted as representative and exhibited, besides the well-known forms, new connectors for making T and L-joints such as would be necessary when turning sharp corners with large cables. It is stated that the Chicago City Railway Company has adopted the Dossert connector for all its new work and that it is now using two-way, three-way and cable taps of various sizes, as well as this company's mechanical joints up to 1,000,000 circular mils in capacity. It is also stated that the Metropolitan West Side Elevated Railway has found it advisable to use three-way and four-way connectors in wiring its new cars.

Some of the other products of this company for which orders have recently been placed are as follows: A neat type of pot-

head connector by the use of which high-tension cables emerging from a pot-head may so be joined to the inside wiring that they are easily disconnected; combination fuse-box plugs, of which more than 125,000 are in use by the Brooklyn Edison Company; special double cable-taps used with jumpers for the Bridgeport Electric Traction Company; special bonding connectors used by the New York Central & Hudson River Railroad, and a type of insulated motor-lead connector, which has found general favor, is used in large numbers by the Philadelphia Rapid Transit Company. This list of products will serve to show how the Dossert type of joint may be used for all classes of work, from connecting ground wires with iron pipe to splicing 1,000,000-circular mil cables.

The Western Electric Company at its Hawthorne plant recently made a comparative test to learn the relative merits of a 1,000,000-circular mil two-way Dossert solderless connection and the common form of soldered copper sleeve. As regards time, the mechanical connection was made in 20 minutes while the joint with a copper sleeve required four hours for making. A test for conductivity showed the mechanical connection to have a loss of .05 per cent compared with a loss of .30 per cent for the soldered joint. The mechanical joint also saved more than two feet of cable, the cost of which was said to equal that of the joint itself. As a result of these tests the Western Electric Company has adopted this type of connection for use on its various products.

SOME EXHIBITS AT THE CHICAGO ELECTRICAL SHOW.

In previous issues of the Electric Railway Review mention has been made of the very interesting collection of exhibits recently shown at the Coliseum in Chicago. Among the exhibits that were of special interest to electric railway interests and which as yet have not been mentioned in these columns were the following:

The American Steel & Wire Company had a very attractive display, including many of its large number of products which are in general use in the electric railway field, such as pin-driven and other types of rail bonds, copper and steel wire, cables and many of the smaller products such as springs, etc.

The Albert & J. M. Anderson Manufacturing Company included in its display sample-boards exhibiting this company's standard overhead fittings. In its booth was shown the Anderson third-rail bracket for supporting the underrunning type of third rail. With this type of bracket the head of the rail is rigidly held by a malleable-iron support, insulation being provided by using the well-known "Aetna" material.

A number of typical designs of clay conduits suitable for single and multiple-duct work were exhibited by the American Sewer Pipe Company. These products are designed and finished in such a way as to adapt them for heavy cable-work.

The following well-known supplies for general wiring and electrical use were exhibited by the Central Electric Company: Okonite wire, Columbia incandescent lamps, Deltabeston magnet wire, D & W fuses, cut-outs, subway and transformer boxes, Edison batteries and fan-motor outfits, Knowles high-tension insulators, Okonite and Mason tapes and various styles of arc and incandescent lamps with reflectors.

The Chicago Pneumatic Tool Company, Chicago, displayed an interesting line of portable electric tools in operation at its exhibit at the Chicago electrical show, consisting of Duntley portable electric drills, grinders and hoists. The drills, which have been on the market for several years, are made in sizes having drilling capacities from three-eighths of an inch to three inches and are made for alternating as well as direct current. A Duntley electric hoist of 1,000 pounds capacity was also shown in operation. This hoist was of the worm-gear type with double-hoisting drums, self-locking and the motor was provided with a dynamic brake. This hoist is made in sizes ranging from 250 to 2,000 pounds capacity.

The products of the Crane Company as exhibited included two large valves designed for remote control. One of these valves was of the gate type, motor-operated, and built of this company's "ferrosteel." The other valve was a 24-inch hydraulically operated gate-valve, provided with an electrical device controlling the admission of water into the operating cylinder. The exhibit also included many of the standard types of smaller valves for use in steam boiler plants.

The Joseph Dixon Crucible Company showed its various types of graphite paints and lubricants, special crucibles for melting brass and a line of Dixon graphite motor-brushes.

The Electrical Appliance Company of Chicago made an attractive exhibit of the many specialties for which it is agent. Among these products are Packard lamps and transformers, Sangamo meters, Stombaugh guy anchors, Paranite wire and complete types of telephone equipment.

The Electric Service Supplies Company exhibited the Automotoneer, which is a controller regulator so constructed that a motorman is prevented from turning on the full current in one sweep of the controller handle. The Automotoneer makes it necessary for him to pause at each point of the controller, so that he cannot start the car suddenly. To the railway operator it means a saving in current. This company's other well-known supplies were also exhibited in an attractive way.

The Electric Storage Battery Company exhibited its well-known types of chloride accumulators of various capacities, from 2½ to 4,800-ampere hours. This larger type of cell has been adopted by the New York Central Railroad Company in the storage-battery stations operating in connection with its rotary-converter substations supplying current for its electrified lines.

The Gould Storage Battery Company had in its exhibit a 49-

plate cell with a capacity of 5,760-ampere hours, the plates of this cell being held in the lead-lined tank furnished with a lead-glass cover. Other types of cells were exhibited as suitable for the following classes of service: Regulating battery, ignition battery, train-lighting sets and signal batteries. The exhibit also included an excellent display of photographs showing working installations of this company's products.

The General Electric Company made an especially fine display of its well-known types of incandescent lamps, including the late high-efficiency products. Many household electrical attachments, suitable for sale by light and power companies, were shown in actual use. These included kitchen, bathroom and bedroom devices.

Mr. J. Allen Haines had space at the Coliseum and represented the following companies whose products he handles: American Electric Heater Company, Bishop Guttapercha Company, Clifton Manufacturing Company, Dayton Electrical Manufacturing Company, the Electric Cable Company, Schwarze Electric Company, Stanley & Patterson and the Wire & Telephone Company of America.

A 100-line express-type magneto switchboard with connecting telephones and a central-energy private branch-exchange switchboard with common-battery telephones were exhibited by the Kellogg Switchboard & Supply Company. This exhibit also included an eight-party harmonic selective system showing the latest improvements for party lines.

The National Carbon Company exhibited various types of its products, including arc-light carbon, motor and dynamo brushes and dry-battery parts.

The Lima jack box, as exhibited by W. N. Matthews & Brother, affords an efficient means of connection to the regular telephone line. Its use is as follows: The boxes are installed on poles every quarter or half mile throughout the line of the railway and each box is connected to the regular telephone wires. Each train crew is equipped with a portable telephone and a Lima jack box plug. When a train gets to a siding where it is instructed to ask for orders the conductor takes his portable telephone and pushes his plug into the jack box and gets instantaneous connection with the dispatcher. The Lima jack box and plug have been in constant use on a number of interurban electric roads in Ohio and Indiana for the past two years.

The National Battery Company had on exhibit various types of accumulator cells for general service such as telephone, fire-alarm and automobile work.

The Ohio Brass Company exhibited overhead electric railway supplies, such as trolley hangers, bars, etc., and also had on exhibition a line of rail bonds. This company also showed a section of the New York Central's third rail supported by the type of the third-rail insulator which was furnished by the company for their recent installation and which this company is now furnishing for additional work.

The H. A. Peterson Manufacturing Company, Harvey, Ill., exhibited electrical conduits known as "Harveyduct" and designed to protect lighting and power wires for all classes of interior work.

The Simplex Electric Heating Company had a working exhibit of electric heating and cooking appliances which it manufactures, together with its well-known line of car heaters.

The United Indurated Fibre Company had a very complete line of its products suitable for protecting the various types of third rails and for use in conduit, cable-ways and transformers.

The Universal Electric Storage Battery Company exhibited a house-lighting plant suitable for a private residence, the Crocker-Wheeler generator of this plant being belted to a Fairbanks-Morse gasoline engine.

The Wagner Electric Manufacturing Company had on exhibit a single-phase elevator motor. This type of machine will open up possibilities in the line of power supply for systems not equipped to sell direct current. The Wagner exhibit also included transformers, transformer parts, a single-phase variable-speed motor and single-phase vertical type motors suitable for driving vertical pumps.

In the Westinghouse exhibit there were to be seen twenty odd machines of widely varying types, driven by motors. Some one of many uses demonstrated by the motor-driven household utensils in operation in the exhibit included washing, ironing and sewing machines and a sanitary cleaning and scrubbing outfit. Among the machines of interest to manufacturers were a lathic, saw sharpener, ventilating fan, printing press, drill and blacksmith blower.

American Trolley Wheel Company, Charleston, W. Va., has been incorporated with a capital stock of \$10,000 to manufacture and sell trolley wheels. The incorporators are: B. G. Young, C. W. Pickering, Adam B. Littlepage, D. H. Pritchett and John Hall.

Smith Improved Lock Nut Company, Rockford, Ill., has increased its capital stock from \$30,000 to \$60,000 to take care of the construction and installation of the track bolt department. This company has heretofore confined itself to the manufacture of the Smith improved nut only, but the demand for this nut seems to make it advisable to manufacture bolts for it. A new brick building is being erected in which track bolts and machine bolts equipped with the ordinary hexagon and square nuts will be manufactured. The company intends to devote particular attention to the steam and electric roads in the central west. This is the third addition to the manufacturing plant since the company was organized about 18 months ago. The Railway Specialty & Supply Company, Great Northern building, Chicago, is the sole agent in this country, Canada and Mexico.

The Chicago traction situation is nearer settlement than it has been for ten years. By a vote of 56 to 13 the city council passed the Chicago City Railway Company and the Chicago Railways Company ordinances early on the morning of February 5. As earlier announced the Chicago Railways Company is the corporate name of the new company which will be formed to take over the Union Traction lines. Mayor Dunne probably will exercise his right of veto at the council meeting on February 11, but the supporters of the ordinances showed in the vote this week a sufficient majority to pass the measures over the veto. The ordinances contain a provision that unless they are approved by the voters on April 2 they shall not become operative. Mayor Dunne contends that the ordinances have been so drawn that they will be effective in their present shape without the approval of the voters.

Though most of the larger companies have long realized the advantages derived from having one or more wrecking cars at some centrally located point or points, ready for immediate service, many of the shorter lines have neglected this highly important part of the equipment. The reason for this is doubtless because accidents on the smaller roads are comparatively few in number and therefore the cost and maintenance of a special wrecking car is not warranted. A point which is overlooked, however, is the fact that an old car with the body removed and fitted up with pieces of rail, jacks, chain-blocks, replacers and the regular tools necessary for the clearing of wrecks and the repair of tracks, will give all the service required and can also be used for the transportation of material and on construction work when not needed for wrecking purposes. Such a car would serve all the requirements of a small road and save considerable delay and reduce the cost of clearing wreckage. For city use where a block is likely to be caused by any obstruction to the track wrecking cars are of less value, since the car can

not always be run to the place of the accident, and in this case a wagon properly fitted out is of more service.

There is little advantage in paying for the most economical types of engines and specifying the most expensive boiler designs, installing the most approved systems of economizers, automatic stokers, and high-pressure gravity drip apparatus with condensation returns to the boilers, if the consumption of coal is allowed to become excessive by the escape of steam or hot water from the plant through leaky boiler tubes and feed piping, loosely-jointed pipes and stop valves, or loosely-worn valves and pistons in the cylinders of engines and pumping machinery. Where the steam is highly superheated, it is even more difficult to keep valves tight, and much is yet to be learned about the best metals for the high and low-temperature service required in valves for use on superheated lines. It sometimes happens that the leakage of a steam trap will go on undetected for weeks if regular inspections of the piping systems are not in vogue, with a resulting fuel waste which entirely offsets the supposed economy of an expensively designed plant. It is more or less a thankless task to hunt down leaks and repair them. In most cases it would be highly profitable if a thorough examination were made every fortnight or possibly once a month for leakage. Visible waste of steam is easy to detect, of course, but the loss through defective traps and remote auxiliary piping can best be tested out by noting the fall of water in the boiler water columns when the turbines and engines, pumps and heaters are cut off from operation and full steam pressure maintained in the boilers. Radiation and connection losses must be made up by a steady coal consumption, reduced though it may be, so that actual steam leakage cannot be determined by its influence on the coal pile without going to great trouble; but the simple expedient of noting the fall of the water column—which should remain stationary if there is

no leakage—is so easily applied that there is little excuse for its neglect in practice.

A STANDARD FREQUENCY FOR ALTERNATING-CURRENT TRACTION.

Probably the most interesting and important part of the paper by Messrs. L. B. Stillwell and H. S. Putnam on "The Substitution of the Electric Motor for the Steam Locomotive" (Electric Railway Review, February 2, page 150, and this issue 192), related to the question of standardizing the frequency of the current cycle. It is easy to see that it is as yet premature and useless to make laborious calculations of the comparative cost of operating the railroads of the entire United States by steam locomotives and electric motors and that it is sufficient to obtain data for particular conditions where electrification appears to be desirable and for which such estimates are requested. The adoption of a standard current for heavy electric traction is a more hopeful and profitable subject for discussion by electrical engineers, and this we regard as the most valuable result of the recent paper on these subjects.

It appeared to be taken for granted by the authors of the paper and by the principal speakers in the discussion that single-phase alternating-current motors generally will be used on electric locomotives for operating heavy through trains. Such electrification will be a gradual extension of the more immediate work for terminals, tunnels and mountain grades until it includes complete divisions of main line. The system which ultimately will be used for main-line traction should therefore be used for the preliminary work at terminals and a decision to standardize the single-phase current for all heavy traction would effect a greater economy for the owners of steam railroads than can now be realized. The disposition of the electrical engineers at the recent meeting to recommend such a system came much nearer to a general agreement than ever before, and the principal part of the discussion related to the question as to whether a frequency of 25 or of 15 cycles per second should be generally adopted.

While practice with the alternating current in this country has accepted 25 cycles to a large extent, the lower frequency is used successfully for locomotives by two of the largest electrical manufacturing companies in Europe, the Ganz Company in Australia and the Oerlekon Company in Switzerland. In this country the large manufacturers have done sufficient experimental work with motors operated by 15-cycle-current to enable them to speak definitely in its favor. The argument that the higher frequency of 25 cycles is now fairly well established, and that drawings, patterns and conveniences for manufacture are now prepared for building apparatus suitable for that frequency should have little weight in view of the larger work on heavy electric traction using electric locomotives for freight and passenger service which is now in sight and for which it is acknowledged 15-cycle current is better adapted.

The principal reasons for a change to the lower frequency relate to dimensions, weight, efficiency, power factor and commutation in a motor, and the advantages of 15 cycles in this respect have been shown not only by theoretical considerations, but by demonstration in actual practice. The weight and dimensions of motors operating at 15 cycles, as compared with 25-cycle apparatus, can be reduced so that it would often be possible to use two motors where four would be required with the higher frequency. This would effect a saving not only in the weight and cost of motors, but it would also simplify the wiring and auxiliary apparatus.

For high-speed passenger locomotives, which should be gearless, motors designed for 15-cycle current will develop with equal efficiency the greater pull at the drawbar for a given weight per axle. This advantage amounts to 25 or 30 per cent. The reason for not going below 15 cycles is that

at this frequency the fields are practically saturated and any lower one would limit the output; besides, the disadvantages of lower speed of turbo-generators and weight of transformers then become important.

An electric locomotive with single-phase series motors designed for 15 cycles can be operated at slightly reduced capacity with current at 25 cycles, and by adding a 15-cycle transformer an equipment designed for 25 cycles can be adapted for operation on either 25 or 15 cycles. This would make available for use where necessary or desirable, were the lower frequency to be made standard, generators producing current at 25 cycles and car and locomotive equipments designed for the higher frequency. A reduction in the number of motors with 15-cycle current cannot be made where it is necessary to operate the same motor with alternating current and direct current, as this practice requires four motors in one group in order to obtain the benefits of series-parallel control. Such conditions should not be numerous and the result of standardizing the single-phase motor for heavy traction would tend to prevent an increase in that kind of equipment.

The principal objections urged against the 15-cycle current relate to increase cost of generating apparatus and transformers and to the unsuitability of this frequency for lighting cars, but it was shown that the reduction in cost of car and locomotive equipment would more than offset the increased cost of generators and transformers, and that satisfactory lighting with 15 cycles can be obtained by the use of low-voltage lamps having heavy filaments.

In the light of past experience with the slow-moving standardization problems and with another great change requiring conditions favorable to interchange of traffic, it is fortunate that there is little question as to the kind of current which should generally be used for electric traction and that it appears to be possible to arrive at an early agreement on a standard for it.

THE INCREASING SIZE OF BOILERS.

Perhaps the most salient feature of power plant development in the past decade is the constantly increasing capacity of engine and generator units. These gains in size now seem to have reached at least a temporary standstill, for it is a grave question how far it is wise to tie up the capacity of a plant in a very limited number of units. There does not appear much evidence from actual daily operating records that the mammoth turbo-alternator of 10,000 kilowatts capacity for an hour or so is more economical than the machines of 5,000-kilowatt normal output, and there is certainly little question as to which installation is the more flexible from the operating standpoint.

Whatever the future may hold in store for prime movers in the way of ultimate sizes—and it is not at all unlikely that the more general electrification of steam roads will demand even huger machines than those of the present day—it is certain that for a long time to come there will be a demand for larger boiler units than the manufacturers are as yet supplying. For some reason, possibly the difficulty of stoking large grates or the inconvenience of branching out too far from accepted standards of shell size, the modern steam boiler has been slow to respond to the demand for greater concentration of power, but within the last three years the widespread use of the steam turbine has brought about a very perceptible increase in boiler heating surface. A gain of 50 or 60 per cent has been made in several cases over the original 4,000 or 5,000 square feet of heating surface which, until very recently, marked a boiler as one of unusually high capacity. We certainly are not far from the day when a boiler of 10,000 square feet of surface will be regarded as a standard specification, and if engines and turbines of 7,500 to 10,000 horsepower continue to be installed

in large new plants it is a question if the boilermaker will stop at 10,000 square feet.

Hand firing is, of course, increasingly difficult as the size of grates goes up, but few designers of such large plants as these would fail to urge the use of mechanical stokers. The advantages of large boiler units are so great that they are certain to be demanded more and more. Grates can be divided into sections, two or more to the same boiler, so that the loss of heat and fuel through banking fires will be much reduced. With the load curve common in railway plants the use of sectionalized fires is almost sure to be a step toward lower cost of power, for as the sharp peaks of the rush hours come on it is a simple task to fire up another furnace and enjoy thereby a more rapid acceleration in the generation of steam than is possible in working up the vitality of a half-dead fire which has been banked for hours. Radiation losses should be less in proportion to the increase in heating surface; the floor space also should be noticeably decreased—one of the most important points of all—and the general economy of the boiler room bettered. The boilermaker and the manufacturer of mechanical stokers will have to put their energies together to cut down the present gap between prime mover and boiler bulk for the same capacity of plant, but unless we are mistaken there is going to be some good work done along this line in the next few years.

ASSEMBLING NEW CARS.

The widespread adoption of heavier standards of rolling stock on electric railways in the last few years has strained the facilities of many repair shops to their utmost. Recently built shops for important city and interurban systems reflect this evolution of cars and motive power in the equipment of every department. More powerful tools, better hoisting facilities, the extension of the direct motor-drive for machine tools, the use of high-speed steel in the rougher operations, a better working organization and improved store-room facilities, are significant results of the advent of larger and more valuable equipment in the operating department. Master mechanics are working hard to cut down production costs in terms of output in railway shops no less than in industrial plants, and the work of repairs has been thoroughly taken in hand. In the assembly of heavy rolling stock, however, much remains to be done in the direction of reducing the time and expense of the work; for the opportunity to apply far-sighted methods in the erection of new and improved cars is thus far a relatively new proposition to the electric railway shop manager.

If it were feasible from the dual standpoint of factory cost and convenience of transportation few roads would attempt the burdensome task of equipping new cars in their own shops and thereby running the risk of blocking the necessary repairs upon their regular service equipment. But the modern high-powered car contains parts made by several manufacturers; the body, trucks, motors and control, airbrake apparatus, heaters and other apparatus are in no case yet made in a single factory, but must be assembled at the most convenient point for all concerned, which is the purchaser's shop. Even if it were possible to go into the open market and buy new cars complete and ready for service on the "hand-me-down" principle, the question of shipment over the railroads would present grave difficulties. Some of the later electric car bodies have had to be shipped by rail under special permits and with extraordinary care on account of their dimensions exceeding by an inch or two the steam railroad company's standard requirements and it is hard to see how complete cars could be shipped by rail except as parts of regular freight trains—a course which few electric railway managers are as yet ready to approve. It seems to be a settled thing that a certain amount of assembling must be done at the purchaser's own shops, and if the work is han-

dled right there is no question that the erection can be performed at not much more than half the expense which would be entailed by having it done at the original manufacturing plants. A further advantage accrues from the opportunity of the shop force to familiarize itself with any new features in design and construction, so that repairs can be more quickly made after the equipment is put on the road in commercial service.

Economy in assembly can only be attained by the practice of carefully planning for the new work, setting apart certain men for the tasks of erection alone, and organizing the labor and material alone or else separately from the usual shop routine. The number and value of the cars purchased and the relative complication of their equipment should dictate the extent of the organization necessary to handle the assembly promptly and at the lowest reasonable cost. The purchase of 40 or 50 cars, costing complete upwards of \$500,000, if handsomely finished according to modern ideas and fitted with fireproof bodies, motors, trucks, brakes and control suitable for multiple-unit operation at speeds of from 40 to 70 miles per hour, justifies setting apart or fitting up a separate or subshop with a foreman and stock room of its own, to say nothing of the special individual and machine tools and labor-saving kinks which the peculiar circumstances of such large purchases demand.

The importance of the separate stock-room is not easy to exaggerate in large jobs like the foregoing. If the thousand and one odd pieces of equipment which go to make up each complete car are stored in the regular shop stock-room, the chances are ten to one that they will be unavailable when wanted, or at least misplaced, on account of the temptation to use them as repair parts for old equipment. The most scrupulous care ought to be observed in checking up each piece as it arrives, including the date, by reference to an equipment sheet on which the exact number of parts needed by each car is stated in red ink, or in some other striking manner. Single pieces like the contactors in the multiple-unit control system, which are shipped in individual boxes, need not always be unpacked until wanted, but experience has shown the importance of sharp checking. A separate tool-room with facilities for grinding drills, reamers and other cutting devices is certainly worth considering when a large assembly job is projected.

In the labor organization it has been found most essential to separate the different kinds of work upon the car so as to avoid interference in cramped spaces, and to carry the same job through all cars in rotation, making each workman as far as possible a specialist, as in wiring master controllers in cabs, fitting up the car-lighting circuits, connecting motor-men's brake valves, installing reversers, contactors, etc. In this way the progress of the work will be delayed by fewer cases of waiting for other men to finish specific tasks, and the usual loss of 15 or 20 minutes per man in changing jobs will be greatly decreased. In the drilling of holes for wiring conduits and airbrake system pipes, the small 110-volt electric drill of about $\frac{1}{4}$ horsepower recently has made a good name for itself, it having been found on a large car assembly job that small pneumatic drills are not as readily repaired. On some of the later cars no less than 750 holes, varying from small sizes up to about $1\frac{1}{4}$ inches diameter, are necessary, allowing for the pipe conduit, airbrake and angle-iron equipment; and the economy of the portable drill in such a case is too obvious to dwell upon. In this connection the use of special wooden templates has been found invaluable, for they can quickly and cheaply be constructed for any part of the car and applied in either fixed or folding form to vestibule pockets, floors, or any other barrier which has to be traversed by wiring and fixtures.

The use of labor-saving devices is, of course, just as important in an erection job as in regular maintenance. Special clamps and blocking are convenient; portable lamps with

reflectors to keep the rays out of the worker's eyes are a necessity; pneumatic jacks, hydraulic and small electric hoists are worth many times their cost to the company, and in the assembly of cars equipped with pipe conduit wiring, a pneumatic pipe-bender of two or three tons capacity for sharp and difficult curves and a hand-bender of the lever type for easy, long swings are indispensable.

OPERATIONS OF THE SOUTH SIDE ELEVATED ROAD.

That the operation of the South Side Elevated Railroad of Chicago was hampered materially by the construction work in progress is shown plainly by the annual report for the year 1906. It is shown with equal clearness that high prices of labor and materials affected the results. These factors, together with increased competition, caused by improvements in the surface lines, were responsible for the outcome of the year's business, which, as compared with the previous year, was in brief: an increase of 4.4 per cent in gross earnings from all sources, an increase of 14.6 per cent in operating expenses and a loss of 11.9 per cent in net earnings.

Between 1899 and 1905 the cost of conducting transportation on this road fluctuated only 2 per cent. It was kept between 25.4 and 27.4 per cent of gross passenger earnings. These two figures were reached in 1902 and 1901 respectively. Last year there was a striking change; from a percentage of 26.5 in 1905, the cost of this item ran up to 31 per cent in 1906. This is the highest figure shown since the road was fully equipped for operation by electricity. It was exceeded in 1897, when steam locomotives were used entirely, and in 1898, when the change to electricity was made. The cost of conducting transportation in 1906 was 4.5 per cent higher on passenger receipts than the same expense in 1905. In explaining to the stockholders the causes of the decline in net earnings the retiring president, Mr. Leslie Carter, said that the principal single item of added expense was an increase in the cost of coal of \$26,753. This sum is equivalent to 1.5 per cent of gross passenger receipts. The remaining difference of 3 per cent between the two years represents higher cost of other materials, higher wages and the in-

condition of the company and its application of income to betterment and to conducting transportation accounts:

Year	Per Cent of Increase in Gross, all Sources, Over Previous Year	Maintenance of Way and Structures Per Mile of Structure	Conducting Transportation - Per Cent of Gross Passenger Earnings	Maintenance of Equipment - Per Cent of Gross Passenger Earnings
1906	4.4	\$9,110	31	8.3
1905	8.7	8,431	26.5	8.5
1904	6.2	7,587	27.2	8.4
1903	13.1	7,514	25.9	8.1
1902	8.9	6,710	25.4	7.4
1901	5.8	8,703	27.4	7.9
1900	9.9	5,238	26.6	8.5
1899	19.6	5,929	26.2	7
1898	42	3,692	39.5	5.7
†1897		2,656	56.9	6.6

*Decrease.
†11 months only.

Some explanation of the changes shown by these figures is needed. The gain of 13.1 per cent in gross earnings in 1903 as compared with 1902 is excessive. It was due to a strike which interrupted travel on the surface lines. The decrease in 1904 reflects the return to normal business. The expenditures for maintenance of way and structures are figured per mile of elevated structure. This expense for 1906 probably covers some small portion of the new extensions, but no allowance was made for the increased mileage in the computation. The original mileage comprised 8.56 miles of elevated structure. Until April 20, 1898, the road was operated entirely by steam, but after July 27 of that year electricity was substituted. The company has had the advantage of connection with the Union loop since October, 1897.

During the current year the operations of the property will be somewhat complicated, but unless there is unexpected delay revenue will be received from all the new extensions at the close of the year. The company will have to meet, for the greater part of the twelve months, the additional expense of operating parts of incomplete lines. With the new lines the company will approximately double its mileage, and its subsequent operations will be on a much larger scale than heretofore.

EARNINGS OF STONE & WEBSTER COMPANIES IN 1906.

The year book of Stone & Webster has just been issued, showing the earnings and expenses for the year 1906 of the

Earnings and Expenses of the Stone & Webster Companies for the Year 1906.

	Gross Earnings.	Operating Expenses.	Net Earnings.	Interest Charges.	Balance.	Dividends.

*Includes one-half of Sydney & Glace Bay Railway Company, Ltd., earnings.

creased difficulty of operating the line during a period of construction.

The present company is now about 10 years old. It was formed on behalf of the first-mortgage and extension bondholders to take the property from a receiver. The management has been aggressive in developing business. The growth of traffic is revealed by the fact that the number of passengers daily increased from 36,727 in 1896 to 94,313 in 1906, a gain of 156 per cent.

The following table shows some of the changes in the

companies managed by this organization. Descriptions of the principal features affecting the companies, their capitalization, dates of dividend disbursements, and maps of the districts served are given.

The table presented herewith shows that the Seattle Electric Company earned, gross, \$3,101,385.77, or about three times as much as the next largest company, the Dallas Electric Corporation, which reports \$1,023,135.91. The smallest gross earnings—\$89,041.34—are shown by the Blue Hill Street Railway Company of Canton, Mass.

BOOK TABLE.

The Treatment of Storage Batteries. By R. W. Vicarey. London, January, 1907. Published by The Electric Accumulator, 15 Queen Street, Cheapside, London, E. C. 58+xl pages; 34 illustrations in the text, 4 tables; 8 by 11 inches. Paper, 2s. 6d. net.

The author of this treatise has no doubt filled a long felt want for a book suitable for those in charge of storage batteries. It is written for operators who know little or nothing about the construction, use or management of batteries, and who desire information on these subjects, written in simple and concise language. While all theoretical discussions are carefully avoided, the practical information and advice contained in this book is excellent. The subject of care and management is treated in a most thorough and intelligent manner, and is worthy of the careful perusal of all those having charge of any size of batteries.

The book takes up the treatment of the subject by discussing the proper location for the battery, selection of the battery and the importance of proper erection. It then gives methods for testing the polarity of the charging dynamo, making the initial charge and of making a discharge test. The succeeding chapters consider ordinary charging, electrolytes, methods of connecting the cells, manipulation of the regulating switch, inspection of cells, gradual sulphating, indicators of irregularities of the plates or electrolyte and circumstances which should never be permitted to exist. Simple remedies which may be applied are then given, including reversals, replacing old cells with new ones, methods of changing the electrolyte if it contains impurities, methods of charging, temperature of the electrolyte, how to determine whether positive or negative plate is at fault, overcharging, growing and buckling, scaling and shedding of active material, rests of cells, varying rates of discharge, local action and keeping the specific gravity of the electrolyte properly adjusted.

At the end of the book is given a glossary of all the technical and trade names and expressions used in connection with storage batteries. This will be much appreciated by those not thoroughly familiar with the subject.

Switchboards.—By William Baxter, Jr. Published by Derry-Collard Company, New York, 1906. Cloth, 188 pp., 5½ by 7¾ inches. Price, \$1.50 net, postage paid.

In any generating plant the switchboard is the operating center, upon the condition of which depends the continuity of service as afforded by the machinery controlled and regulated with the apparatus mounted on this board. It would seem, therefore, that switchboard design should offer problems worthy of much careful study. We are pleased to note that the author of this new work on the subject has treated the switchboard not only as a piece of mechanical apparatus, but as a delicate electrical device which should be capable of displaying the comparative values of the currents which it controls and serve as a distribution center controlling the output of the electrical machinery. In this book the author first outlines the earlier and more crude forms of switchboards. Some of the subjects treated progressively with the development of switchboard construction are as follows: Instruments needed, connections of shunt and compound windings, connections of distributing circuits, three-wire circuits, parallel operation, arrangement of instruments and switches. Following this first section of the book the author discusses the arrangement of boards in actual service, using diagrams of these boards to illustrate details of design which should be considered. The next section of the book is devoted to the construction of switchboards. It outlines the mechanical part of switchboard work, such as the choice and arrangement of conductors, method of supporting and the arrangement of panels, etc. In this section are also considered the electrical and mechanical details of arc-lighting switchboards, alternating-current switchboards for single and polyphase currents, synchronizers, ground detectors, high-tension switchboards and oil-break

switches. In one chapter the author discusses switches of all kinds, varying from simple key switches to power-operated, oil-break, high-voltage switches. Circuit-breakers are discussed and enlarged diagrams shown of the essential parts of the more common types of breakers as used in railway and lighting work. The last chapter in the book outlines the essential principles of the more satisfactory types of lightning arresters and illustrates some apparatus now in actual use.

As this book is devoid of any purely theoretical discussions, and as the subjects are introduced in the order of their development, using many clear illustrations, it should prove to be useful for those who have to do with either the design or the operation of switchboards for controlling the output of electrical machinery.

Electrical Engineering—An Elementary Text Book. By E. Rosenberg. Translated from the German by W. W. Haldane Gee, B. S., and Carl Kinzbrunner. Revised and brought down to date by Edward B. Raymond, B. S., General Superintendent Schenectady Works of the General Electric Company. Published by John Wiley & Sons, 45 East Nineteenth Street, New York, 1907. Cloth, 347 pages, 6 by 9 inches, with 333 illustrations. Price, \$2.00 net.

The object of the author in writing this book is identical with that of the series of lectures upon which it is based—to present the elements and principles of electrical engineering in such clear and simple language that they can easily be understood by those who are interested, or working in any of the electrical industries. Having this object in view, all mathematics has been omitted; a thorough knowledge of arithmetic being all that is required to follow the arguments in any part of the work. Throughout the entire book, analogies are drawn with well-known facts to enable the reader to understand the different electrical phenomena. The simple relations are stated as formulae, after they have been explained and illustrated by practical examples. This, no doubt, facilitates memorizing those which should be remembered. Some points of particular note are the illustrations and the unusual amount of space which has been devoted to measuring instruments, controllers, switchboard apparatus, accumulators, lighting and especially the chapters on alternating currents.

The section on alternating currents begins with a discussion of the development of the required knowledge of the properties of angles. This is followed by some experiments with alternating currents. The results of these experiments are then used to explain the transformer and the details of its construction. This is followed by a short discussion of vector diagrams and alternating-current calculations, and the application of these calculations and the experiments to the operation of alternating-current meters. Types of alternating-current generators, windings and details of construction are next treated, as well as the effect of inductance and capacity upon the regulation of the generator and the effect which these have on the line losses. The succeeding chapter deals with the operations of generators in parallel and describes the methods and instruments used for synchronizing the machines. Synchronous motors and rotary converters are treated in separate chapters, quite extensively considering that all higher mathematics is omitted.

The final portion of the book begins with the development of the rotating field, and from it, the polyphase motor and generator. Faults with alternating-current motors and the remedies to be applied are then discussed, and followed with a short description of high tension transmission lines and apparatus.

The book is well written, printed on good paper and the illustrations are excellent.

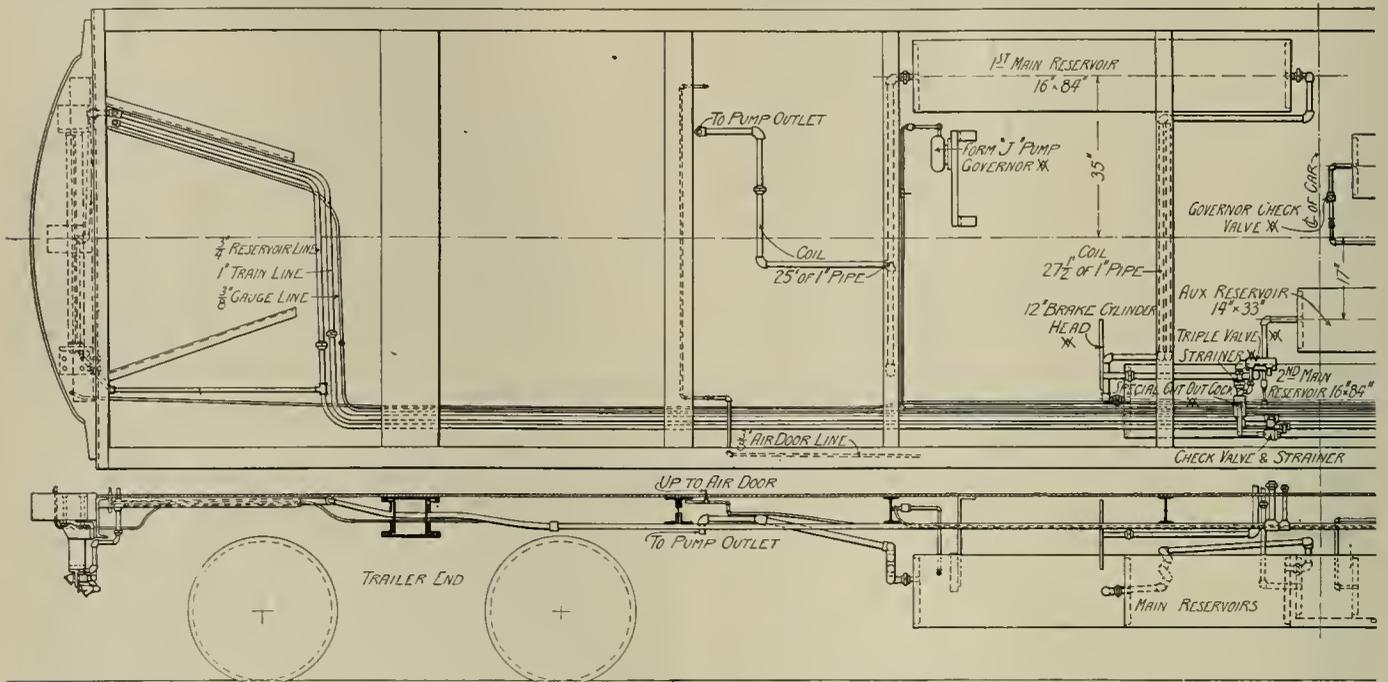

The average daily traffic on the Chicago & Oak Park Elevated Railroad for the month of January, 1907, was 46,919 passengers. This is an increase of 1.59 per cent over the same month for the year 1906.

NEW MOTOR CARS FOR THE METROPOLITAN WEST SIDE ELEVATED RAILWAY.

After numerous orders, placed from time to time with various car builders, the Metropolitan West Side Elevated Railway Company has evolved a type of motor car particu-

motors and control apparatus by the Westinghouse Electric & Manufacturing Company.

The length of the cars on the Metropolitan is restricted by the curves of the Union loop, special trackwork in some places having only 90-foot radii. The new cars, therefore, are not made longer than previous equipments.

Plan of New Motor Cars for the Metropolitan West Side Elevated Railway.

larly adapted to its service and traffic conditions. In this car the desirable features of previous equipments have been retained, while unnecessary or objectionable details have been omitted. In the installation of the electrical and air-brake equipment the effort has been to simplify construction and to make the arrangement convenient for repairs. In the construction of the body the lines of the car are simple and clean-cut, being almost severe in plainness and lack of

The length of the car body on the center line over end-plates is 47 feet 7 3/4 inches; the distance between center of trucks is 33 feet 7 inches. The extreme width of the car over side sills is 8 feet 6 inches. The height of the car from top of rail to top of upper deck roof is 12 feet 10 inches and the height of the car floor above top of rail (light) is 3 feet 10 inches. The cars seat 48 passengers.

In the construction of the underframe there are no center

Metropolitan Motor Cars—Side View.

ornamentation, the only striping being a line on the letter-board and a 3/4-inch band just above the side sill of the steel subframe.

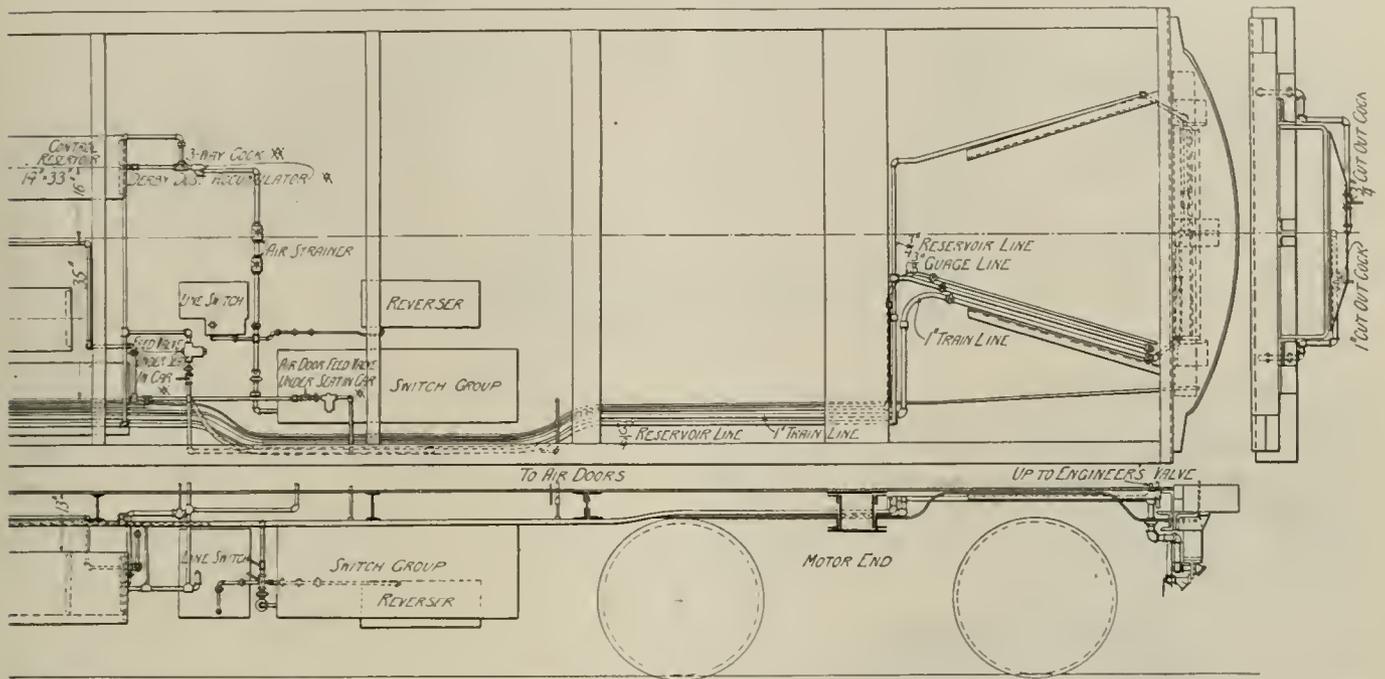

The car bodies were built by the Pullman company, the trucks by the Baldwin Locomotive Works and the electric

sills, and this assists materially in simplifying the arrangement of the auxiliary equipment under the car. The side sills are 9-inch I-beams, weighing 21 pounds per foot and running the full length of the car. These are reinforced by 1 1/4-inch truss rods with 1 3/8-inch turn buckles. The end sills are

9-inch channels, weighing 25 pounds per foot. These extend to the outer edge of the side sills. The body holster is a box-beam built up of plates and angles; it is 12½ inches wide and 9 inches deep. The beams which support the floor extend across between the side sills. They are 6-inch I-beams weighing 12¼ pounds per foot, with the exception of those

non-conductor of heat or cold and keeps the floor comfortable, and also assists in making it fireproof.

The clearance required for motors made it necessary to offset the drawbar, and in order to make a stiff and strong construction a new design has been made, which is shown in detail. It is 5 feet 11½ inches long, 14¾ inches wide over

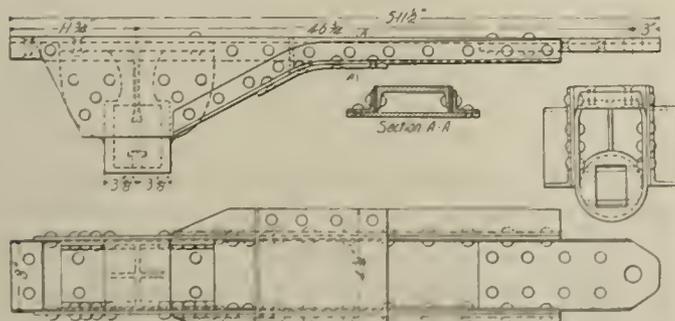

showing the Disposition of the Apparatus on the Under Side of the Car.

nearest the bolster, which are 6-inch plate girders with 3-inch angle-iron flanges.

The floor between the body bolster and the end sill at the vestibule is stiffened by two 3-inch angle-irons placed diagonally, as shown in the drawing. The buffer timber is built up of two pieces, each 3 by 14 inches, of clear white oak, well seasoned. The front is armored by a 5/12 by ½-inch plate and is supported by three steel bracket castings riveted to the end sill. The entire floor frame is covered with steel plate 3/16-inch thick, which greatly stiffens the car against twisting in the severe service due to the sharp reverse curves on the elevated system. It also protects the entire wooden

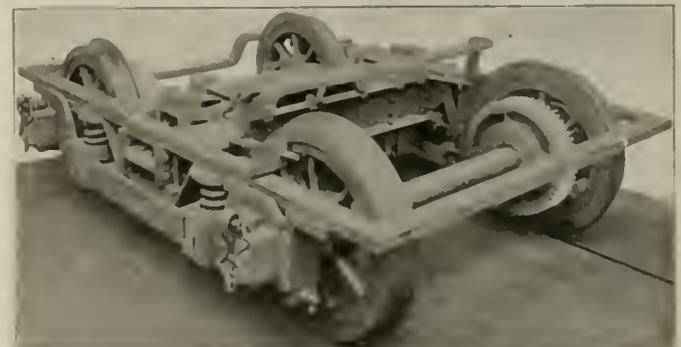

angles and consists mainly of an 8-inch channel, which is reinforced at the back end where it is secured to the truck center-pin and at the front end by a steel casting, which is arranged to fit the back end of the coupler. The drawbar, which swings to permit rounding of short curves, is supported by a sector bar of sufficient length to permit a full swing of the drawbar on a curve of 90-foot radius.

Special attention is called to the arrangement of the equipment under the car, as all the hangers have been specially designed for mounting the control and airbrake apparatus in such a way as to enable the conduit and pipe con-

Metropolitan Motor Cars—Built-Up Coupler Bar.

portion of the body from the motor circuits and wiring carrying heavy currents. There has been no case of burning of cars from operating circuits since this construction was adopted. On top of this steel plate are riveted 2 by 2½-inch angles, to which are bolted 2 by 2 by 2¼-inch nailing strips, to which, in turn, is secured the usual wooden floor. The 2-inch space between the steel and wooden floor is filled with mineral wool packed so as to have a density equal to 12 pounds per cubic foot. This acts as a deadener of sound; it is a

Metropolitan Motor Cars—Motor Truck.

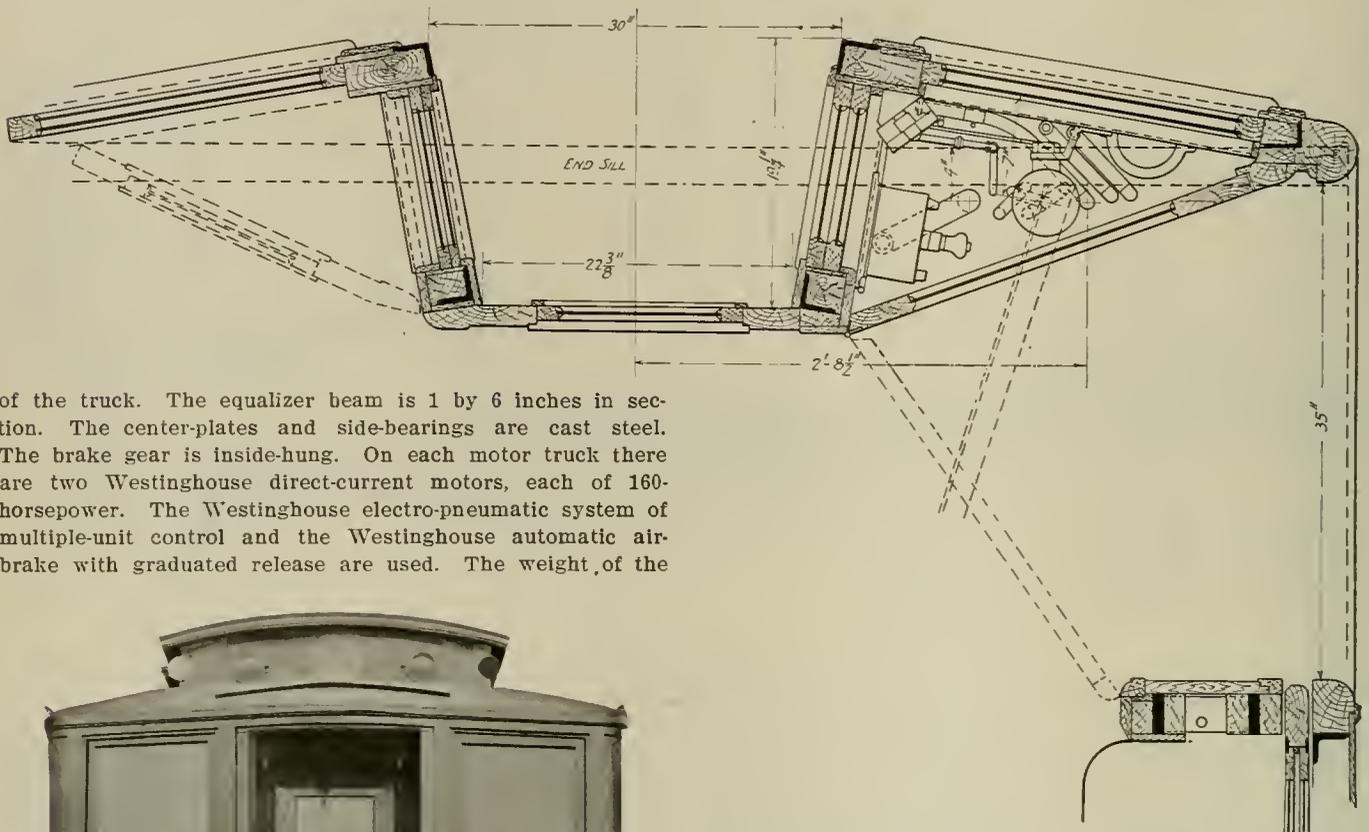

nection to be simply and conveniently arranged. The ordinary practice is to mount apparatus directly on the car bottom and then make connections to fit in any way that they may come.

Trucks.

The motor trucks have a wheel-base of 6 feet 6 inches and 34¼-inch steel-tired wheels with cast centers made by the Standard Steel Works. The weight of each truck is 12,500 pounds. The trailer trucks have a wheel-base of 5 feet

6 inches, with $3\frac{1}{4}$ -inch wheels, and weigh 9,000 pounds each. The truck-frame proper is made of one rectangular forging with wrought pedestals bolted to it. The swinging bolster rests on two sets of triple elliptic springs 33 inches long, supported on a heavy iron seat, which in turn is hung from bars passing over the bolster and resting in the transoms

wide. The corner and door posts are composite, made of whitewood and ash with angle-irons between. At the guard's niche the two outside posts are made of white wood with $2\frac{1}{2}$ by $2\frac{1}{2}$ -inch angle-irons on the outside corners. The two inside posts are made of ash with $2\frac{1}{2}$ by $2\frac{1}{2}$ -inch angle-irons on the corners. These angle-irons are bolted to the

Metropolitan Motor Cars—Plan Showing Arrangement of Doors and Control Apparatus at End of Car.

of the truck. The equalizer beam is 1 by 6 inches in section. The center-plates and side-bearings are cast steel. The brake gear is inside-hung. On each motor truck there are two Westinghouse direct-current motors, each of 160-horsepower. The Westinghouse electro-pneumatic system of multiple-unit control and the Westinghouse automatic air-brake with graduated release are used. The weight, of the

floor and to angle-irons in the roof, which connect the outside posts with the anti-telescoping plate. The usual truss plank is omitted and solid sheeting is used from the floor to the belt rail. There are five composite carlines of $1\frac{1}{2}$ by $\frac{1}{2}$ -inch iron and ash $\frac{7}{8}$ -inch thick. The roof is made of whitewood or poplar $\frac{1}{2}$ inch thick and covered with No. 6 cotton duck. The vestibule and guard's niche are shown by cross-section in detail.

The right corner at each end of the car contains the motorman's brake valve, air gauge, master switch and other small switches. A motorman's cab is formed by a hinged door, which in one position encloses the brake valve and master switch, and at about 90 degrees engages with the arched posts of the car. The front windows of the motorman's cab are glazed with double plate-glass; the inside faces of which are treated with glycerin to prevent them from being frosted. The vestibule door is arranged to swing back about 120 degrees to the end corner, where it can be fastened open and out of the way in summer time.

There is no outside platform for passengers to stand on. The side doors, 35 inches wide, are hung on roller bearings and equipped with devices for operating them by air pressure.

The inside finish of the car is of solid Mexican mahogany slightly stained and rubbed down to a dull surface. The ornaments are simple inlaid lines and only plain moldings necessary for structural purposes are used.

The headlight and marker system is indicated by the illustration of the end view of the car. The upper deck, instead of rounding off at the extreme end of the car, is cut away on a straight line about 18 inches back from the end

Metropolitan Motor Cars—End View.

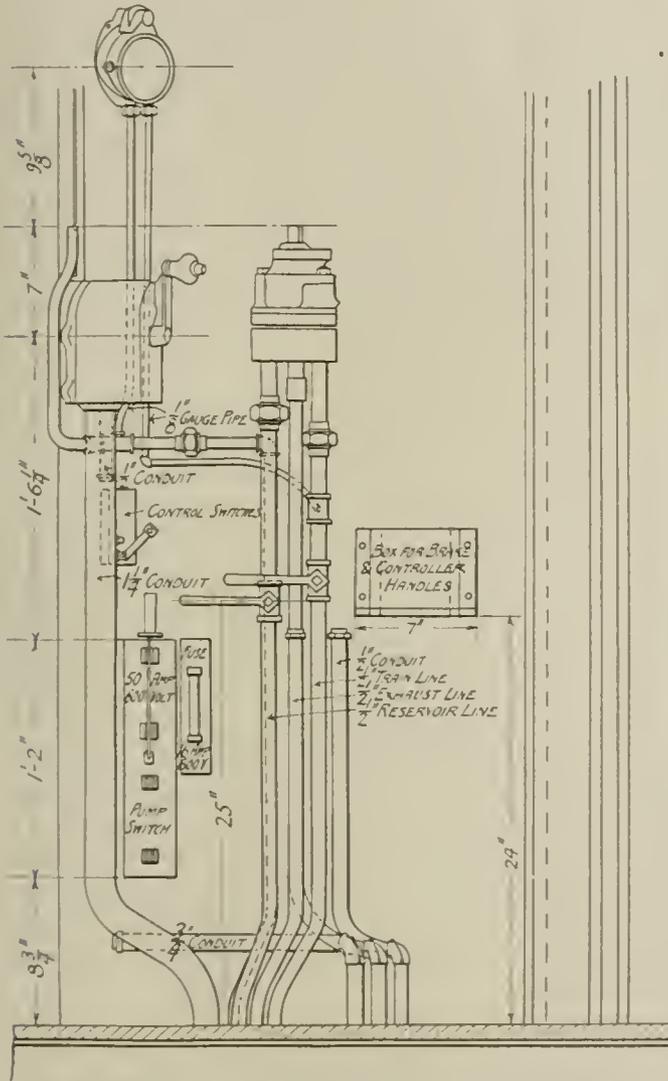

car complete with equipment is 66,000 pounds, and the weight of the car body about 30,000 pounds.

Construction of Car Body.

The construction of the car above the steel underframe includes the wooden side sills of $4\frac{1}{2}$ by $5\frac{3}{8}$ -inch long-leaf yellow pine. The car floor is made of long-leaf yellow pine thoroughly seasoned, $\frac{13}{16}$ -inch thick, and not over $3\frac{1}{2}$ inches

and a vertical plate is fitted into the car framing. This plate contains at the center a glass disc behind which the headlight is placed, and at each side is a 4-inch lens. The lamps for night markers are placed back of these and the same mechanism which operates these also displays the daylight markers. This design does away with the usual outside lanterns and headlights.

The hardware used throughout the car has statuary bronze finish, which retains its original color and is not easily tarnished. The cars are heated by hot water and also arranged for electric heating when desirable. The heating

Metropolitan Motor Cars—Elevation of Control Apparatus.

coils under the car seats are enclosed by perforated steel sheets so as to prevent rubbish from accumulating beneath the seats. Thus the floors are more easily cleaned.

The car throughout is a marked improvement on those previously built, particularly in the smaller details which affect maintenance and repairs. They are attractive in appearance and very comfortable.

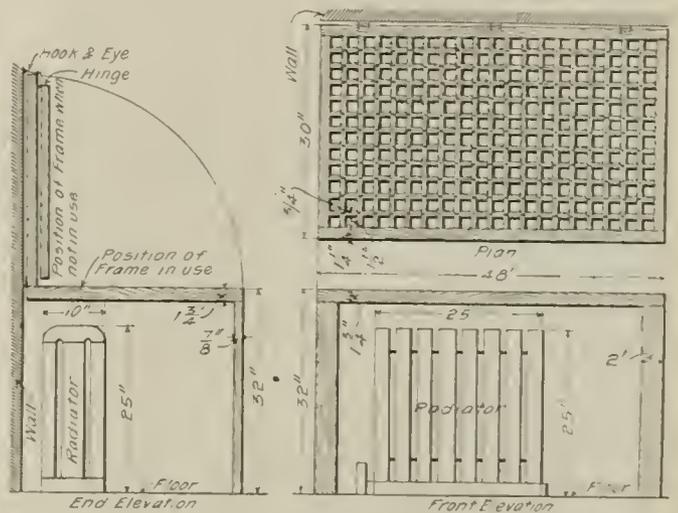

We are indebted to Mr. H. G. Hetzler, president, and Mr. B. H. Glover, superintendent of motive power and way, Metropolitan West Side Elevated, for the drawings, photographs and information for this description.

The Washington Baltimore & Annapolis Railway is now employing a night force on the construction of its line from Washington, D. C., to Baltimore and Annapolis, Md., in the effort to have the road completed and in operation by July 1. A large force of men has been employed, but bad weather has caused many delays.

A CONVENIENT BLUEPRINT FRAME.

Through the courtesy of Mr. George A. Kimball, chief engineer of elevated construction, Boston Elevated Railway Company, we print herewith a drawing of a special frame for drying blueprints which was designed by Mr. H. C. Hardwell for service on the roof of the company's office building. As the main offices of the Boston elevated are located in the heart of the business district, space is at a premium in the blue printing department. A small pent house on the roof is used for photographic and printing purposes, and several thousand negatives of important work on the system, a large movable blueprint frame with table adjustable for varying sun positions, a washing tank, drying racks, developing cupboard and various supplies are compactly stored in this space.

The quick drying of blueprints is often essential in the company's work, particularly with reference to drawings desired by general officers, city authorities, and various commissions. To facilitate the task the white pine latticed frame

A Convenient Blue Print Frame.

shown was designed, to enable prints to be quickly removed from the washing tank and dripping rack, and dried with blotters over a steam radiator. The wet prints on the upper side of the frame and the intense heat of the radiator about 2 1/4 inches beneath the lower side made a specially strong construction necessary to resist the warping and buckling strains due to the difference in temperatures.

The frame is 48 inches long by 30 inches wide. It is composed of strips 3/4 inch wide halved and screwed at all intersections and spaced 1 1/2 inches apart in centers. The recesses cut in each strip are bolted together in a manner so substantial that buckling is impossible. The frame is finished with shellac. The height above the floor is 32 inches when the table is down ready for service. The frame is hinged and equipped with hooks and eyes so that it folds back against the wall when not in use. It was built in the company's shops and the cost was trifling in comparison with the convenience which it affords.

It is stated that the line between Youngstown and East Liverpool, O., which is now under construction by the Youngstown & Southern line extends from Youngstown to Leetonia, railroad will be ready for operation by March 1. The Youngstown & Southern line extends from Youngstown to Leetonia, part of which was formerly operated as a steam road. The Youngstown & Ohio River line extends from Leetonia to East Liverpool. Power will be rented temporarily until the power now under construction at West Point is complete. S. J. Dill, of Youngstown, general manager.

ELECTRIC RAILWAY AFFAIRS IN GREAT BRITAIN.

(FROM OUR LONDON CORRESPONDENT.)

The depositing of private bills for the 1907 session has once more rearranged the complex factors in the London electric power situation. On the one hand, the county council has prepared a most ambitious scheme which, on its engineering side, is more faithfully modelled than even before on that prepared in 1904 by Mr. Merz for the Administrative County Company. It involves the ultimate purchase of all existing undertakings, both company and municipal, in the county of London, and for a wide area outside the county. A new and gigantic power station will be erected at Barking or Erith to supply these undertakings with electricity in bulk, and the complete scheme will demand a capital of little less than 25 millions. As a speculation this power scheme far exceeds in magnitude and risk the tramway scheme to which the council is already committed.

On the other hand the Administrative County Company appears on the scene again with an altered form of proposal. In its report the parliamentary committee mentioned, as alternatives to complete company or county council control, a compromise whereby a company should take the speculative part and the council the non-speculative part of the enterprise; or, secondly, the leasing of the entire undertaking by the county council to a company for the initial period. The new bill promoted by the Administrative company is to enable the company to enter into such arrangements, and, under them, to generate and supply electricity to authorized distributors and to power users. This sort of mongrel enterprise is based on the theory that a certain amount of control by the county council is inevitable in the present state of public opinion, and that, consequently, a purely company scheme has no chance of success with parliament. The London county council, on its side, is keenly sensitive to the trend of public opinion with regard to its business capabilities, and especially with regard to vast increases in its financial liabilities. Rumor declares that even the progressives are favoring a transfer of the speculative risk and of most of the capital burden to a company in a manner suggested by the parliamentary committee. Thus is reached the curious situation that a company, conscious of county council prestige, seeks alliance with it, while the county council itself, conscious of diminishing prestige, is considering a division of liabilities with a friendly company. It is obvious that the solution of this part of the situation depends largely upon the results of the county council elections next March.

* * *

Antagonistic to both these schemes is the bill promoted by all the London electricity supply companies. This is a highly interesting scheme, but it has the misfortune (from the parliamentary point of view) of being quite unprecedented. There are 14 companies, several competing with each other in central districts, and their proposal is to constitute and to incorporate a joint committee in which will be vested the generating stations belonging to all the companies. Powers are sought to distribute electricity over the county of London and a wide area outside. The argument for this scheme is that by linking together the existing stations and arranging for mutual assistance, the electrical needs of London may be met, now and hereafter, with a comparatively small outlay and without the creation of a new body with rights which may injuriously affect the existing undertakings. Each company would continue to distribute electricity to consumers as at present, but the linking up of stations would release a large amount of reserve plant which could be utilized in taking up new power business as well as the supply in bulk to other authorized distributors. The outline of this combined scheme was put before the parliamentary committee last summer, but it did not seem to receive much attention. Probably the feeling was that it had come rather late

in the day; at any rate, no one can doubt that if the companies had, in 1905, fought together instead of separately and had, in 1906, promoted the bill which has now been drafted, their prospects would have been much brighter. As things are, the venture has the appearance of a forlorn hope. It will be opposed as a vicious "combine" and as a contravention of the accepted principle that the highest economy is secured by generation in a single large station for distribution to numerous customers over a large area.

Meanwhile the local authorities concerned with electricity supply are playing a more or less passive part. It is not quite certain how the new moderate councils will act, but there seems to be a decided feeling against the county council ambition to acquire all the municipal electrical undertakings compulsorily. It is impossible for any responsible observer to say how the situation will resolve itself, since the policy of the county council may be reversed next spring; but the best hopes lie in the direction of extended co-operation among the various parties interested. Any further delay would be most serious to the electrical supply industry in London. Already the continued uncertainty is restricting the development of business by postponing the raising and expenditure of new capital. The deadlock has been created more by political than by industrial causes, and is therefore the more intolerable to business men.

* * *

An interesting development of its electric train service has just been inaugurated by the Lancashire & Yorkshire Railway Company in the electrification of its Liverpool Southport & Crossens lines. The adoption of electricity brought with it the necessity for the exercise of a great deal of ingenuity in a variety of matters connected with third-rail guarding, the protection of the public at grade crossings, and so on. That the measures taken have been sufficient seems to be fully proved by the rarity of electric shock accidents or fatalities. When this line was new a number of trespassers and some of the railwaymen were killed through coming in contact with the live rail. It required time for the public to understand the risks they ran in trespassing on the converted track, and for the railway management to make trespassing more difficult and to adopt adequate guarding for the protection of its own employes. There are, of course, a great number of arguments to be produced in favor of single-phase traction with overhead wires for railway working, but the experience on our direct-current lines with the live conductors laid between or at the side of the running rails certainly has not produced that evidence of danger that was expected.

* * *

By the courtesy of Mr. C. B. Byles, the signal engineer of the Lancashire & Yorkshire railway, I am able to put before your readers some particulars of an interesting and new application of electricity for an auxiliary purpose. I refer to the electrical working of the grade crossing gates at Waterloo, near Liverpool. By employing a 2-hp., electric motor (speed 1,500 revolutions per minute) it is possible to accomplish the movement of the gates in about 15 seconds. The motor is so connected that its action may be reversed for respectively opening and closing the gates. A lever, the normal position of which is midway in the frame, is provided to operate the electrical switches, and a forward movement of this lever applies current to operate the motor in one direction, and the reverse movement of the lever applies current for the opposite direction. In addition to the switches worked by this lever, there is a graduated switch worked by hand; this is provided so that the signalman may regulate the speed of the motor as the gates are worked. When the movement of the gates is completed in either direction the current is cut off automatically by means of switches worked off the gate shaft. Mr. Byles anticipates that the average

consumption of current per day will be about two Board of Trade units.

* * *

The Lancashire papers have recently been advancing arguments in favor of electrical instead of steam driving in textile mills. They state that so much saving will be effected in buildings, foundations, gearing, rope, race, etc.—usually amounting to several thousands of pounds sterling—that the first cost of the two systems will closely approximate. By using in the power-house turbines, or the best make of triple expansion high-speed engines, with superheated steam and a high vacuum, the coal consumption can be brought down to a remarkably low figure which can quite easily compete with a high-class steam drive. In two recent instances of the adoption of electrical driving in Lancashire textile mills, increased outputs of 7½ per cent and 12½ per cent have resulted.

* * *

Owing to the withdrawal of the Metropolitan's through services over the East London railway, in consequence of the electrification of the Hammersmith & City line, a deadlock has arisen with regard to passenger traffic on the East London. Formerly both the District and the Metropolitan worked through passenger services over the line. On the electrification of the District that line withdrew its services, as the East London had not been electrified, and now the Metropolitan has been obliged to discontinue its trains for the same reason. This means that all passengers to or from either systems are obliged to change en route. The East London is a line of which the *raison d'être* is only the through traffic passing over it between other railways, and it is now in the unfortunate position of existing as a more or less isolated steam railway, surrounded on all sides by connecting electric lines. The question of electrification has been before the board for some years, and in spite of what has been accomplished by the Metropolitan, the District and the joint District and Tilbury line (the Whitechapel & Bow railway), nothing has been done on the East London. Lord Claud Hamilton, the chairman, has frequently asserted that the development of electric traction for railways was not yet sufficiently advanced for the conversion of the East London to be undertaken, but the real difficulty is evidently to be found in the joint ownership of the line, which seems to have stood in the way of any practical solution. In view of the serious decline in the company's stocks, a situation that directly discourages traffic is not likely to commend itself to the independent shareholders. Possibly the six owning companies may combine to undertake the work of conversion, instead of standing in another's way, as is apparently the case at present.

An Electric Line in Switzerland.

The La Gruyere electric railroad has been recently laid out through a picturesque region of Switzerland not far from Lake Lemman, and has already a large tourist traffic. Several years ago two companies obtained concessions for railroads, one running from Chatel Saint Denis to Paleyieux, and a second from the former point to Bulle and Monthovon. These companies were consolidated, and the electric equipment of the system, which makes a single continuous line, was carried out by the Alloth company, of Bale. The total length of the three sections of the road is 28 miles, and the road uses Vignole rails, weighing 53 pounds per yard, except within some of the towns, where a grooved rail is employed. Motor cars of some length, either separate or coupled together to form a train, are used in this case, and the current is taken by overhead trolley from a suspended wire. A single wood pole, with a long bracket arm reaching clear across the track, supports the wire, and the trolley, mounted on the car roof, is of the arched or bow form.—*Electrical Review*

MOTORMEN'S SCHOOL, DENVER CITY TRAMWAY COMPANY.

BY H. W. SCOTT, INSTRUCTOR OF MOTORMEN.

A schoolroom for motormen has recently been established by the Denver City Tramway Company and fitted with apparatus suitable for teaching applicants for positions the rudiments of car operation.

The accompanying illustration is a view of one end of the schoolroom. At the end of the room, not shown by the photograph, are two platforms, each intended to represent the front end of a two-motor car. They are both equipped with General Electric type-K controllers, a handbrake, connected under the platform to coil springs, which give about the same leverage as the brake of an ordinary car; also gong, sand-plunger, and a fender-trip or trigger attached to the controller reverse-lever. The latter is an ingenious contrivance devised and patented by Mr. D. P. Powell, one of our motormen, and since adopted by this company. By its use a motorman is enabled to reverse a car and drop the fender with one movement of the hand. The controllers on these platforms are not connected to any apparatus, but are sim-

Motormen's Schoolroom—Denver City Tramway Company.

ply placed there to show the student their construction, and to give him instruction in the proper method of turning on the current. After the switch-roll and cut-out switches have been explained to him, he takes his place on the platform, while the instructor stands at the controller shown by the photograph, gives the "go-ahead" signal, and actual practice in starting and stopping a car begins.

After satisfactory progress has been made by the student, his attention is next directed to a chart which shows the method of wiring a car. Here he traces the current as it passes from the trolley wire and follows its path through the machinery and apparatus of the car, until it again finds its way back to the power station through the rails. The principle and use of the tank lightning-arrester are next explained and he is shown how to keep these in working order. Considerable time also is given to the details of the car resistance and its functions.

The instructor's platform, shown in the illustration, is equipped with the same apparatus as that used for the students, except that it is provided with both the incandescent and arc headlights. In addition, however, the controller operates the machinery used for instruction. Instead of motors, two large fans are placed in the circuit and shown in the engravings. Underneath each fan is a box containing incandescent lamps; and when either fan is in circuit the lamps

burn and illuminate the transparent glass front. Through a similar transparency the fans are also shown when running either in series or multiple.

A great deal of the student's attention is directed to the scheme of the controller. The principle of first throwing the motors into series and then into parallel is dwelt upon at some length. The difference in wiring and flow of current when in series and parallel or multiple is demonstrated by carefully prepared illustrations. For this particular lesson we have seen nothing better than the drawing prepared by the Brooklyn Rapid Transit Company, and used in its school for motormen. It shows two waterwheels placed one above another on the same service pipe. This is used as an illustration of the motors when in series. The second drawing shows two service pipes, each feeding one waterwheel, and representing the motors in multiple. To demonstrate to the student the amount of resistance which is used at each point in the transition of the controller handle, we use two circuits of lamps, shown in the illustration under the series-multiple transparency. On the first series-point, they all burn, and are gradually cut out as the last series point is reached. On the first multiple-point all the lamps but four again burn, and the student has an ocular demonstration of the resistance in circuit at each movement of the handle.

At the back and to the left of the instructor's platform we have placed a circuit-breaker, overhead switch, fuse-box and two light-circuits with which the ordinary car is equipped. The uses of these appliances are carefully explained by the instructor, and the student receives many hints and suggestions in the manner of detecting and repairing slight defects that may appear in the car lighting system.

The best methods of avoiding accidents are discussed, and the student is impressed with the necessity for calmness and self-control when danger is imminent. The quick use of the reverse is demonstrated, and the best method of feeding the motors in order to obtain the greatest efficiency from the reversing process, is fully explained. In this connection the use of the sander is taken up. The instructor shows how the track may be sanded to the best advantage and how to avoid flattening the wheels.

Our schoolroom is fitted with a section of overhead line, showing an overhead switch and circuit-breaker; and the instructor takes much pains in explaining to the learner the necessity for turning off the current and reducing the speed of the car when passing under special work. We find that motormen as a class are much more careful to avoid injury to the overhead lines if they are shown in detail just what damage may result by careless handling of the current and fast running.

The student's attention is next directed to the principle of the electric track-switch. On the right of the room we have placed a box containing the circuit-changer, with resistance coil on the outside, and an insulated section of the trolley wire, upon which the trolley must rest when the switch is being operated. The student is made acquainted with the operation of the circuit-changer and shown the fallacy and danger of using more than one or two points on the controller, when moving the switch lever. An explanation of the delicate switch mechanism, we find, has a good effect upon all motormen, whether experienced or not. They are invariably more careful in applying the current after they fully understand its workings.

All of our cars are provided, for emergency, with a "trolley wire pickup." One of these is shown in the engraving, standing against the door of the room, and holding a short section of trolley wire. Should the trolley line break in any district where serious delays may result while waiting for the line crew, the conductor and motorman of the nearest car must proceed at once to get the wire off the ground and tie it to the nearest pole or tree; then protect passersby from injury. The student is shown how he may handle the wire

safely and without delay, and the advantages of the "pickup" are demonstrated to him.

The instructions given in our school are all calculated to impress upon the learner the practical workings of the machinery and apparatus under his charge, and the necessity for strict economy in operating. He is made to understand also that his first thought must be for the safety and comfort of his passengers, and that he must exercise gentlemanly courtesy toward all.

A story which has been going the rounds recently tells of a fond father, who, when meeting one of the professors of the school which his boy attended, remarked: "Professor, I understand that my son has been taking algebra under you." "Yes," rejoined the pedagogue, "he has been exposed to algebra, but I'm not sure yet that he is going to take it." After conducting our novice through a labyrinth of instruction and after having given him the benefit of our experience in methods and practice, we often feel that we have "exposed" him, at one sitting, to a rather good-sized fund of knowledge; and we sometimes wonder whether or not it will "take," and how deeply it will sink in.

We place him on a car, under a competent teacher, to begin actual practice, however; but he is invited and expected to return to the instruction room and go over the same course, if necessary, or to post himself on any special subject where in he is lacking. We are gratified to note the general interest which has been displayed by our trainmen since the inauguration of the school. Many have attended the lecture as often as three or four times.

Chattanooga Railways Improvements.

The Chattanooga Railways Company, a consolidation, effected in May, 1906, of the Chattanooga Electric Railway Company and the Rapid Transit Company, is enlarging its power plant at Ridgedale, building commodious shops and car houses and reconstructing its tracks throughout the city. Since these properties were consolidated the company has purchased power from the Chattanooga Electric Company under a 10-year contract. It has been found advisable, however, as a precautionary measure, to rebuild the company's own power plant at Ridgedale and maintain it as a reserve power station. The plant formerly contained two 300-kilowatt and one 400-kilowatt generators. In the reconstruction work these generating units and two 800-kilowatt machines will be installed and kept in condition for emergency cases.

New shops with a floor area of 125 by 200 feet have been completed and will be soon occupied. The shops are equipped throughout with the latest types of machine tools, each driven by an individual motor. The partitions and side walls of the structure are brick and the floors are concrete.

In addition to the various shops, provision is made in this building for a store-room where all supplies for the railway will be kept. The foundations for a car storage house 200 by 210 feet have been laid and work on the building is being rushed. This building also will contain the general offices of the company. Brick and reinforced concrete construction are to be used in this structure and it will be modern in all its appointments. It will be completed and ready for occupancy by June 1, 1907.

Throughout the city the tracks of this company are being relaid and several extensions to the existing lines will be made during the present year.

The report of the Georgia Railway & Electric Company, of Atlanta, Ga., shows that 32,073,750 paid passengers were carried during the year 1906, an increase of 5,538,450 over 1905. The number of transfers used was 6,194,255, an increase of 1,182,184. The daily average number of passengers carried was 87,873, said to be about two-thirds of the estimated population of Atlanta. The number of cars operated increased from 128 to 143.

NASHVILLE TRANSFER PRACTICE AND RESULTS.

The Nashville Railway & Light Company of Nashville, Tenn., has developed a transfer system that overcomes the common abuses and produces interesting results. A central transfer station has been established in the down-town district of Nashville, from which all cars are started and where all passengers are given bodily transfer privileges. There are five other transfer points in the city but so accustomed have the people become to the use of the central station that less than two per cent of all passengers accepting the transfer privileges, transfer at points other than the main station.

The station, which is illustrated, occupies a lot 100 by 200 feet, between Third and Fourth avenues. At present only one track passes through the building but it is planned to lay another track at an early date so that north and south-bound cars can be separated upon entering the station. All cars pass through the building in one direction. Passengers

Entrance to Transfer Station at Nashville.

desiring to transfer from one line to another are at liberty to do so while inside the building. A charge of five cents is made for admittance to the station unless fare has been paid on an incoming car. The entrances to the station are provided with revolving gates through which no one is permitted to pass without first having deposited a nickel with the gate attendant. Provision is made, by means of an open passageway, for allowing passengers not desiring to use their transfer privilege to pass to the street. By this method, it will be seen, only those who have paid their fares on a car or at the gate are allowed in the station.

After a car upon entering the station discharges the incoming and loads the outgoing passengers an inspector rings up on the register the number of passengers the car contains. He then gives the conductor a coupon ticket that indicates the date, the line and the number of fares rung up. This coupon is turned into the office by the conductor after each round trip as fares collected, and a duplicate coupon is turned in by the inspector at night. All fares collected by the conductor after the car leaves the transfer station are recorded on the register in the usual manner.

This system of transferring passengers has been in successful operation for several months, and up to this time

the officials have not discovered a method whereby it can be "worked." Space inside of the station is leased to candy and fruit venders and the walls of the building are rented for advertising purposes. An annual revenue of \$4,500 is obtained from these sources, which amount figures largely in defraying the cost of maintaining the station.

The Nashville Railway & Light Company operates 100 regular cars on a five-minute schedule on the several lines and during the rush hours the number of cars is increased to 120 or 150 and the headway is reduced to four minutes on many of the lines. For this reason it would be expected that serious congestion should result from the handling of so many cars at one point, but owing to the fact that the station is principally patronized only by those desiring transfers no serious blockade has ever occurred.

This centralization of transfers has, however, its disadvantages, inasmuch as it is necessary in some instances to carry passengers a greater distance than would be necessary were transfers given at the point of intersecting or diverging lines, but it is claimed that the disadvantages are more than overcome by the many advantages obtained from defeating the common abuses of the transfer privilege. On account of the small number of individual transfers used by the conductors the company is able to keep very close records of transfers issued. Each conductor is known by his number and is provided with transfers bearing this number.

By this method of keeping tab on the transfers issued the company can immediately trace to its source any trouble that may arise, and ascertain the facts. When a conductor reports for duty he is given a book of transfers, bearing his number, and his punch, which are kept in individual boxes in the office at the transfer station. Upon leaving his run it is obligatory that he deposit them until he again takes a car. Infraction of this rule is punishable by a three-day lay-off, and repeated infractions by dismissal. In case of a three-day lay-off the conductor is compelled to report at the office at the usual time daily.

Elevated Railroad for Rio de Janeiro.

Consul G. E. Anderson, of Rio de Janeiro, reports that one of the last acts of the retiring administration of Brazil was the granting of a 70-year franchise to Carlos Schmidt and others, of Rio de Janeiro, for the construction of an elevated railroad to serve the city of Rio de Janeiro and its suburbs. This franchise was obtained for an American company. It represents a purely American enterprise and present plans are that all the equipment will be purchased in the United States. The company, according to statements made by its projectors in Rio de Janeiro, was organized a short time ago in the state of South Dakota and was capitalized at \$50,000,000. Charles E. Browne, of New York city, is its president. It is planned to send a staff of engineers and technical experts to Rio de Janeiro to commence the preliminary work. Within four years 13-5 miles must be in operation. Plans call for about 60 miles of right of way, which is to be double-tracked throughout. The third-rail electric system will be used, motive power to be derived from the company's own plant or from one of the two great concerns now preparing to develop water power in the mountains near Rio de Janeiro. It is planned to establish a local and a through service for the benefit of the people living in the suburbs.

The projectors estimate that the first year's business on a full working basis ought to show the carriage of passengers to the extent of many times the population of the city at present. For its privileges the company holding the concession must pay the municipality 50,000 milreis per annum for the first year, 60,000 milreis per annum for the next 30 years, and 70,000 milreis per annum for the following 30 years. At present exchange this would amount to \$16,666, \$20,000 and \$23,333 per annum, respectively.

FEEDER AND RETURN SYSTEMS.

HENRY DOCKER JACKSON, E. E.

In designing the distribution system of an electric railway, it should be noted that there are two methods of procedure; first, with regard to ultimate economy, and second, with regard to first cost only. The first takes into consideration, not only the cost of the feeder system, including rail bonds, but also the cost of repairs to motors, controllers, etc., as well as the loss over the feeder system. The second considers the lowest possible cost of feeders and rail bonds that will allow cars to be operated.

There are many electric roads in operation where the feeder system is so small, and the rails so poorly bonded, that although the cars run at long intervals, the loss over the feeder and return, plus the excessive repairs required on the motors, controllers, etc., would go a long way toward paying a dividend. This could be remedied by the addition of a comparatively small amount of feeder and by rebonding the rails.

In order to understand why these things occur, it is necessary to go back to the days of the early roads. When electric roads were first built, it was seriously suggested that only the overhead feeder was necessary as the current would return through the earth. The first trials showed the mistake. It was then attempted to make use of the rails in a small way by tying them to a supplementary wire laid between them. This worked well for a while, as the cars were light, the speed low and the power required small in amount. As the speeds increased the power also increased, thus for most lines additional grounds or return wires were found necessary. In the meantime it was found that joining the rails in good electrical contact would result in a far better return.

Thus the rail bond was introduced and the return wire, which had been placed overhead, was utilized as a feeder. Each new road was patterned after the old roads, with the result that in many cases the feeder systems were far too small. Therefore until recent times the majority of the roads have had inadequate feeder systems. The rolling stock, motors, controllers and generators increased in size and value of service. The overhead wire and rail joints were neglected; even when new roads were built the old methods of track and feeder work were followed. No calculations were made, but the feeder system of some other road was copied in its entirety. No allowance was made for increased traffic, and it often occurred that even from the first the feeder system was inadequate. It was not uncommon, and for that matter is not unknown to-day, to find that the pressure at the end of a line is down to 200 volts, while the station pressure is 550 volts. Would any transmission engineer consider installing a line where the loss, even for a few hours of the day, was as great as this?

The results of such poor feeder circuits were threefold: First, the line loss was excessive and the power required to operate the cars was far above what it should be. Second, the motors having to operate at such low voltages were slow in accelerating. The cars had to be overworked to make the schedules, and thus the motors were overloaded. It was no uncommon thing for a motorman to throw the controller full-on; the excessive feeder drop would prevent the fuse from blowing, but the motors got far more current than they were designed for and as a result, burned-out fields and armatures were common occurrences. The third result appeared as burned-out controllers and flashing-over of motors, caused by the rise in voltage on the line, either from the sudden throwing off of the controller on the car which had had the flash, or on some other car. The guarding against these conditions is of as much importance as ever and should carefully be considered in designing a feeder system.

It would be quite as good engineering to spend as much

time in the design of the distribution system as is spent in preliminary work on the power house, rolling stock and motors. This practice should result in the line loss being reduced to the smallest amount consistent with the interest on the investment for copper. To obtain the best results in designing our distribution lines, a careful study of the physical and operative features of the road is necessary. The probability of increased traffic should be considered along with the stability of the construction materials.

Having these figures well in mind the size of the rail may be determined, and from this the question of rail resistance. Right at this point many errors have crept into resistance calculations. Most handbooks and many engineers give figures for the conductivity of steel rails as compared with copper as 1 to 6 or 1 to 7. Authoritative tests show that such ratios are too low for even low carbon steel as used for third rails, and that for rails used for traction purposes a ratio of 1 to 10 or 1 to 11 is more correct. A rule-of-thumb method is to assume that each pound of rail per yard is the equivalent of 10,000 circular mils cross section of copper; thus a 70-pound rail is the current carrying equivalent of $70 \times 10,000 = 700,000$ circular mils cross-section of copper. With this assumption and the joints bonded to the full capacity of the rail no allowance need be made for drop at the joints. Nevertheless it will be found advisable to add 15 per cent to the rail resistance as just estimated, when computing the total resistance of the track. This allowance is usually warranted because the rail is seldom bonded to its capacity; for example, the usual bonding for city service is two No. 0000 bonds for a 90-pound rail. The two No. 0000 bonds have a cross-section of 423,200 circular mils, while the rail is the equivalent of 900,000 circular mils.

When a joint is first bonded, its resistance may be as low as that of the same length of rail, this being partially due to the carrying capacity of the plates. Rust, however, soon insulates the plates and then the joint is reduced in capacity to the conductivity of the bonds.

To what capacity the rails should be bonded is determined by the conditions of service and cost of power. The resistance of the bond when first installed should be as low as possible; at least so low that the loss at the joint will not exceed the interest on the cost of the bond.

In addition to the rails, there is often required other return capacity. To what extent this should be added depends on the same factors. If the cost of power lost in the track return circuit will more than pay the interest on the existing amount of copper then more copper should be added to balance the equation. This rule will apply where no danger of electrolysis exists, otherwise the drop over the return circuit must be made low enough to prevent troublesome electrolytical effects.

The type of bond to be used will largely depend on local conditions as well as on the kind of joint used. Cross bonds should be used as seldom as conditions will warrant. Their duty is to prevent open circuits in the return, and to make available at all times the full capacity of both rails. With the rails connected by double bonds at each joint, the value of cross bonds grows less. Too much reliance should not be placed on them because they may be broken by digging in the streets or be stolen from open track work.

There are many excellent methods for making the rail a continuous conductor, the more satisfactory of which afford a conductivity at the joint even greater than that of an equal length of rail. Some of the more acceptable types of bonds may be enumerated briefly:

Soldered bonds are easily and quickly installed, have low resistance, are cheap and, when care has been taken in placing them, they may be considered as permanent. There is also the desirable feature that they may be placed during wet weather. Wherever these bonds have not met expectations the failure has been due to one of three things—not cleaning

the rail surfaces, insufficient heating of the rail or quenching the solder too quickly.

A bond of the steel-terminal type has recently been developed. It is thought that such bonds will make very good joints, but heretofore failure has been met on account of the inability to make a perfect union between the steel terminal and the copper bond, or the copper has been weakened during the process of manufacture.

The various makes of plug-terminal bonds are well known and they have shown that when carefully installed they will give excellent results in service. In placing such bonds care must be taken to thoroughly clean the hole after drilling and the work should be done in clear dry weather.

Other methods of making the rail a continuous conductor are by the use of electrically welded joint-plates, plastic bonding, by the Nichols cast-zinc joint, the cast and thermit welds.

It should be remembered that no matter what type of bond or rail connection is used, special care is warranted in executing on the work.

ELECTRIC RAILWAY TELEPHONE SERVICE.

Dr. C. J. Woodbury, of the American Telephone & Telegraph Company, was the speaker at the meeting of the New England Street Railway Club on January 31, his topic being the "Application of the Telephone to Railway Service." The address was illustrated by lantern slides and portable telephone apparatus for street railway use was shown.

After a brief historical note on the early suggestions for the use of electric signaling on railways and a short discussion of the value of the fixed and portable telephone in modern steam railroad practise, with special reference to the partial displacement of the telegraph and the operation of simultaneous telephony and telegraphy over the same wires, Dr. Woodbury took up the use of the telephone in electric railway service.

The application of the telephone to street railway service increases the economy of both plant and operation, as single-track roads in thinly populated regions can be operated at an efficiency and with a flexibility that would require a double-track line for safe service without the telephone. As a means of instantaneous transmission of all kinds of operating intelligence it is unsurpassed. A case was cited where a collision of two approaching cars on a single-track section was narrowly averted by a watchman telephoning the power house to shut off the trolley circuit.

Portable telephone sets are generally preferred to fixed sets for long mileage and few cars. Dr. Woodbury stated that the experience of the steam railroads had favored the use of the Bell telephones for the reason that the telephone company maintains the plant so that there is a virtual guarantee of its use; the railroad company is not obliged either to train men for this work or to repair the line. The guarantee of the telephone company also insures first-class apparatus, which may not otherwise be forthcoming.

Several forms of portable sets, weighing from 13.5 pounds up, are in use, though the more substantial forms are considered preferable. Jack-boxes on poles must be well insulated and also be rain, snow, insect and "fool-proof." In the latest equipments the jack is carried at the end of the portable circuit from the car, the plug being installed in the jack-box, which resembles a large petticoat insulator. Telephone circuits should be transposed at least every eight poles and the transposition of parallel circuits staggered. Fixed telephone sets in the vestibules of cars are found preferable on roads having a large number of cars and congested traffic, as they may be used more rapidly by merely attaching the flexible wires to a pole than when it is necessary to take a telephone set from a car and hang it upon a pole. Strong instruments, giving loud and clear transmissions, are essential in railway service.

DELAY REPORTS AT MEMPHIS.

An interesting system of issuing delay reports, which illustrates the value of close organization in street railway operation, is in use on the Memphis Street Railway Company's lines at Memphis, Tenn.

This company operates cars on 14 routes, over each of which a division superintendent has complete charge. All cars in making their runs pass the intersection of Main and Madison streets where a car checker records the car number (and train number during the day) and the time each car passes that point. If any car is found to be running behind its schedule it is necessary that a reasonable explanation be made. The crews make such reports to the division superintendent, who reports to the superintendent of transportation, and he to the general superintendent. So thoroughly has the plan of reporting the causes of delays been developed independent of the train dispatching system that it is not uncommon for the delay reports to reach the main office before

the car record blanks have been completed. The delay reports furnish details as to the line, car number, time (both ways), and cause of the delay. The accompanying illustration is a reproduction of a daily report blank used by the superintendent of transportation of this system.

About Railways.

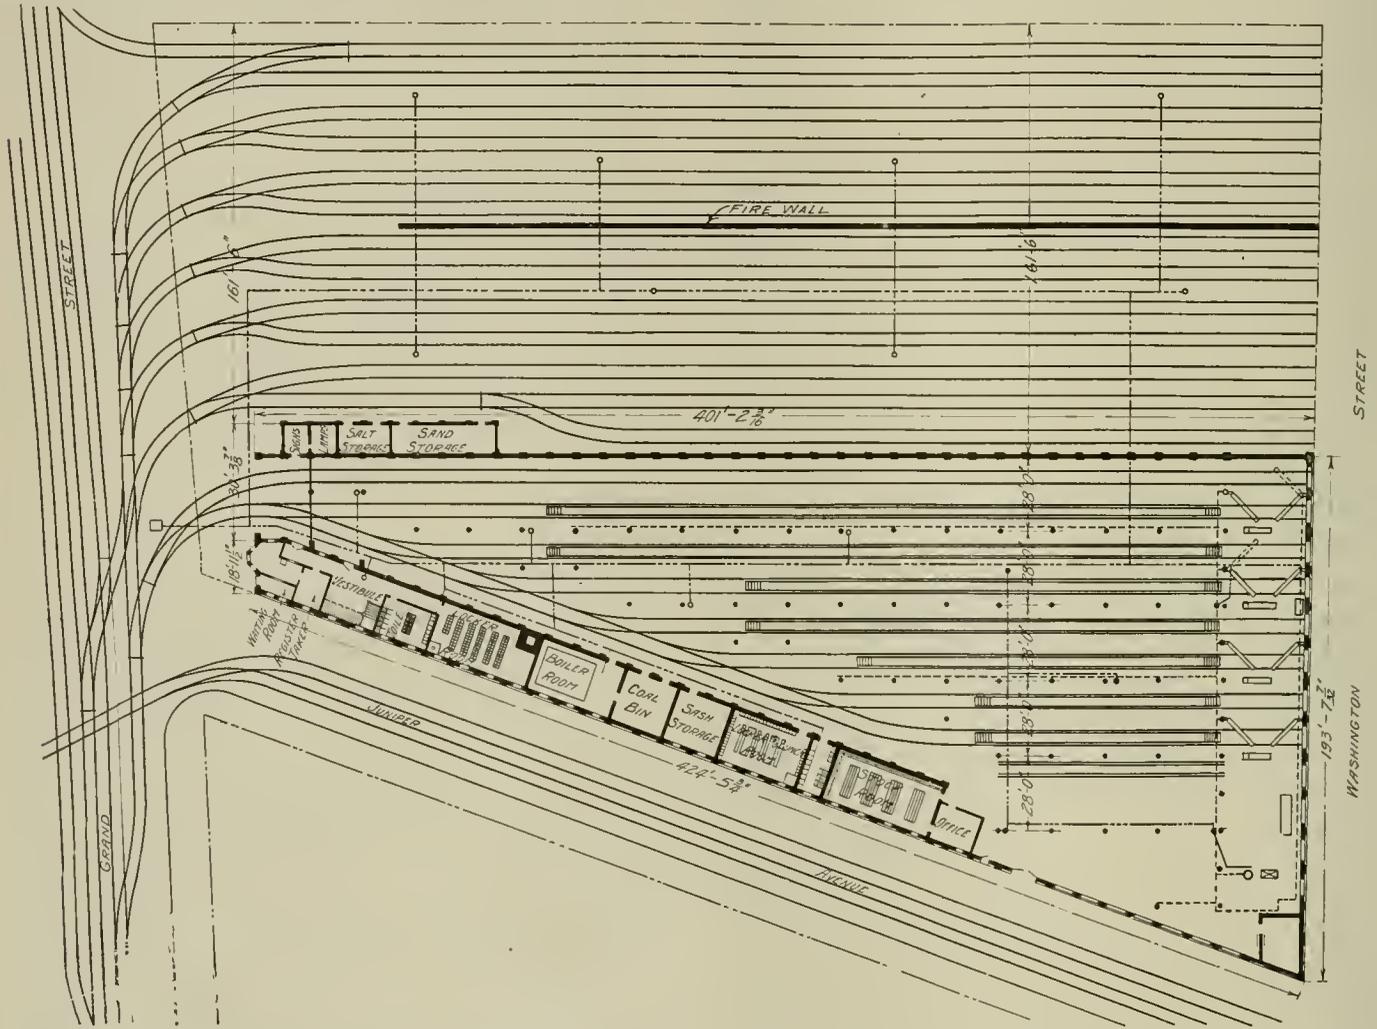

In Great Britain you find both the cheapest and most expensive miles of railway ever constructed. The eight-mile line known as the Wotton tramway, and which was built to the order of the late duke of Buckingham and Chandos, cost only £1,400 a mile. It is of standard gauge and is now used as a light railway.

The most costly piece of railway line in the world is that between the Mansion house and Aldgate, on the Underground, London. It cost nearly £2,000,000. Between Trinity square and King William statue the record rose to no less than 1,000 guineas a yard, about £30 an inch.—London Answers.

MASPETH CAR HOUSE AND SHOPS OF THE BROOKLYN RAPID TRANSIT COMPANY.

The Brooklyn Rapid Transit Company has recently started construction work on a new fireproof surface car barn to accommodate 45 cars, with inspection pits and a small machine shop, and an auxiliary open storage yard with a capacity for 105 cars, in the village of Maspeth, N. Y., to take the place of the now inadequate barns at the corner of Grand street and Juniper avenue, where the cars of the Fresh Pond-Flushing, Flushing avenue, North Beach, Grand street and Metropolitan avenue lines are housed. Maspeth is an important operating point of the company and it has been decided to spend about \$500,000 in the erection of ade-

quate car barn and storage facilities. The structures will be similar in design and equipment to the large new barns and shops of the company at Ninth avenue, which are approaching completion. The ground upon which the car barn will stand is triangular in shape, with a frontage of 50 feet on Grand street, the entrance. The building will extend back to Washington street a distance of 400 feet, with a rear depth on Washington street of 193 feet and a frontage on Juniper avenue, the hypotenuse of the triangle, of 424 feet. The building will consist for the greater part of a single high story, but will be a two-story structure for a distance of 150 feet along Juniper avenue. West of the building will be erected the open car storage yard with 13 tracks served by 6 switches from a Grand street lead track. Through the center of this yard a fire wall will extend and the yards will be surrounded

Brooklyn Rapid Transit Company—Floor Plan of New Office, Shop and Storage Building at Maspeth.

quate car barn and storage facilities. The structures will be similar in design and equipment to the large new barns and shops of the company at Ninth avenue, which are approaching completion.

The ground upon which the car barn will stand is triangular in shape, with a frontage of 50 feet on Grand street, the entrance. The building will extend back to Washington street a distance of 400 feet, with a rear depth on Washington street of 193 feet and a frontage on Juniper avenue, the hypotenuse of the triangle, of 424 feet. The building will consist for the greater part of a single high story, but will be a two-story structure for a distance of 150 feet along Juniper avenue. West of the building will be erected the open car storage yard with 13 tracks served by 6 switches from a Grand street lead track. Through the center of this yard a fire wall will extend and the yards will be surrounded

by a tile fence. A small building within the yard will have compartments for signs, lamps, salt and sand. The entrance to the car barn on Grand street is not of sufficient width to give room for more than two tracks, one having switch connection with the other and forming a straight storage track the entire length of the building. The other is a lead track serving seven tracks equipped with inspection pits. That section of the building formed by the acute angle at the intersection of Juniper avenue and Washington street and a space 35 feet 4 inches wide along the Washington street end is devoted to shop purposes. In this section are gauntlet tracks for wheel storage, over the center of which are suspended from the roof an I-beam trolley runway with chain hoists. The shop will have a forge and several installations

of modern machines will be made, so that light repairs can be made without the necessity of sending cars to the company's car building shops in South Brooklyn. Each lathe or other piece of machinery will receive power individually by direct connected motor, using current from the company's wires. A crane runway extends along the Washington street end and this section is equipped with the usual complement of jib cranes. Reference to the engraving presented herewith will show the attention which has been given the matter of fire protection by direct-connected motor, using current from the company's storage yard. The Grand street frontage of the office portion of the building gives room for the entrance hall and a waiting room for the trainmen. Then come the offices of the dispatchers, the register takers and the day and night depot masters. Back of these are the toilet room and locker room

for the men, boiler room, coal bin, sash storage room, locker and lunch room, stock room and a small office. On the second floor of the barn are offices for the division superintendent and his clerks, and for the men in charge of the mechanical department of this station. A well-lighted and airy lunch room will be equipped on this floor and will be ready for business at all hours. Back of it are club and lounging rooms, with a piano and other forms of amusement, including two standard bowling alleys.

The exterior of the entire structure will be of a fine grade of red pressed brick, while its interior walls are to be constructed of tile and ornamental brick. Floors are to be concrete and ceilings of steel, so that the entire structure will be practically fireproof.

WORK AND WRECKING CAR OF THE CINCINNATI TRACTION COMPANY.

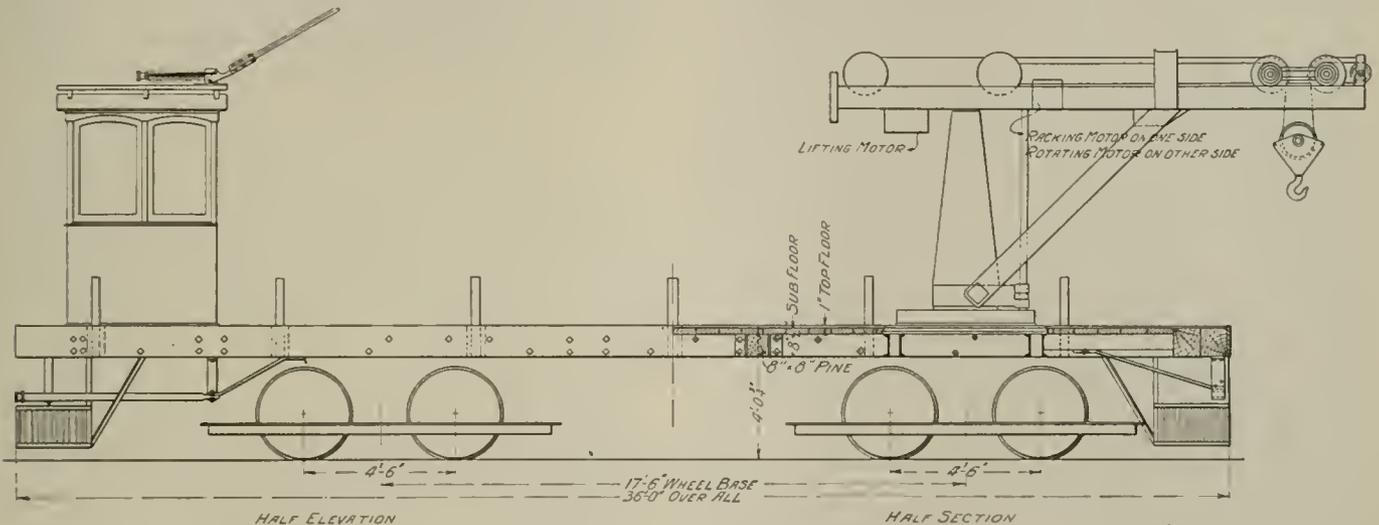

A general utility car of interesting design has recently been put into use on the lines of the Cincinnati Traction Company, at Cincinnati, O. As shown in the accompanying illustration, the car is provided with a swinging boom and

ing, rotating and racking motions respectively. These motors are controlled from the cab, the wires passing through conduits under the floor and up through the post of the crane to the motors, which are located on the boom. The original design of the crane contemplated handling loads of three tons, but some changes have been made in its design so that the equipment is now capable of lifting six tons. The car complete weighs about 50,000 pounds.

THE STRENGTH OF INSULATOR PINS.

Much useful information regarding the comparative strength of wooden insulator pins is furnished in a late report of the Purdue University timber-testing station of the department of agriculture. The report covers the tests made on 53 samples of oak, black locust and rock elm. As stated, though furnishing a fairly reliable indication of the comparative strengths, the number of specimens was not sufficiently large to establish these values as absolute.

The pins were of standard size, 1 1/4 inch by 8 inches. The oak pins were from 1/8 to 1/4 inch shorter than the others, and of slightly smaller diameter at the shoulder. Their

Cincinnati Work and Wrecking Car.

holst mounted over one truck, which makes this equipment available for wrecking purposes. The car is 36 feet long and 8 feet wide. The stringers consist of 8 by 10-inch yellow pine, reinforced on the inside by 8-inch channels and on the outside by 1 by 11-inch steel plates. The other underframing of the car is reinforced by 3/8-inch plates joined to the stringers with 3 1/2 by 3/4-inch angle plates. The floor is laid in two thicknesses, the lower of 2-inch plank laid transversely, and the upper of 1-inch lumber laid lengthwise of the car. The trucks are of the Elliott type with 4-foot 6-inch wheel-base and carrying Westinghouse No. 68 motors. The Cincinnati Traction Company's 33-inch standard steel wheels are used. A motorman's cab located at the front end of the car is 4 by 6 feet in floor area, which allows a 2-foot space on either side of the car floor that may be utilized when carrying steel rails or other supplies of a length equal to or greater than that of the car floor. Thirty-inch sideboards are provided so that the car may be utilized for handling gravel or other loose materials.

The crane, which is probably the most novel feature of the car, is located at the rear end of the platform and is a combination of the rotating, racking and holsting types. It was furnished by the Whiting Foundry Equipment Company, of Harvey, Ill. The derrick has a total height of 8 feet 6 inches above the car floor and the holsting block has a travel of 10 feet from the post to the end of the boom. Motors of 12, 5 and 3 hp. capacity are provided for operating the holst-

lever arm was also about 1/2 inch shorter than in the cases of the other two species.

From the results obtained it appears that the breaking strength of the two shipments of black locust pins was practically the same, and may be taken as 4,000 pounds. Live oak pins came next in order of strength, with a breaking moment of about 3,000 pounds. Rock elm pins were the weakest, having a breaking strength of 2,500 pounds. The oak pins were the heaviest, the locust next, and the elm the lightest. The locust and elm pins failed mostly by splitting from the threads to the shoulder, or by tension at the shoulder. Occasionally the portion of the pin inserted in the block failed by shearing horizontally. The oak pins nearly all failed by tension at the shoulder. An interesting point indicated by the results is that the breaking strength of the pins varied nearly directly as the number of year-rings per radial inch.

The Columbus Railway & Light Company, of Columbus, O., carried over 60,000,000 passengers, including transfers, during the year 1906, an average of 164,250 daily. On straight fares, about 40,000,000 were carried, an average of 110,000 per day. The receipts of the company for the year approximated \$1,540,000. The average fare including transfers was two and six-tenths cents and excluding transfers a fraction less than four cents. Cash fares made up the advance over three and four-sevenths cents, the price of the seven-for-a-quarter tickets.

THE SUBSTITUTION OF THE ELECTRIC MOTOR FOR THE STEAM LOCOMOTIVE.*

(CONTINUED FROM PAGE 160.)

BY LEWIS B. STILLWELL AND HENRY ST. CLAIB PUTNAM.

Comparative Costs of Operation.

The substitution of electric for steam equipment involves a large investment in power plant, and in electric conductors and apparatus for conveying power from the power plant to the moving trains. The distributing system for alternating-current equipment, which is the only class of equipment deserving serious consideration in connection with the general problem which we are discussing, comprises an addition to permanent-way equipment in the form of overhead construction and electrical conductors conveying power from the power house to the trolley or conductor which is carried above the track. For the trolley, a potential of 11,000 volts is suitable and can be adequately insulated. The mechanical support for the trolley comprises, preferably, steel poles with brackets or light steel bridges spanning the track.

The cost of the power plant and distributing system are properly chargeable to capital account.

Our estimates are based upon the assumption that single-phase alternating-current equipment is used; that the trolley potential is 11,000 volts; that each power-house supplies railway line to a distance of 150 miles in each direction, the feeder potential employed being 60,000 volts; that the overhead construction is first class in every respect, and steel bridges and field poles set in concrete being exclusively used for the support of both trolley conductors and feeders.†

As regards equipment of the rolling stock, it is the general practice of our railways to charge against operating expenses all new equipment purchased to replace that which has been worn out in service. In the adoption of electricity, it would seem that this method might be followed in general by our more important railway systems, the substitution of electric equipment beginning naturally upon those parts of the system where the resulting advantages are maximum. In cases where the initial substitution of electricity is on a large scale, as compared with the total rolling-stock equipment of the railroad making the change, it is probable that a part if not all of the cost of electric rolling stock equipment will generally be charged to capital account.

We proceed to compare the cost of electric operation with the cost of operation by steam locomotives, using as our standard of comparison the grand average results in steam operation in the United States for the years 1901-1905, inclusive. These average results are set forth in the following tables compiled from the reports of the Interstate Commerce Commission and printed herewith. Many of the items included in this tabulation vary between wide limits in the practice of different railroads.

Maintenance of Way and Structures.

Under the general heading, "Maintenance of Way and Structures," item No. 1, "repairs of roadway," if changed at all should show some reduction under conditions of electric operation, but obviously no material change is to be expected. We assume therefore that this item, amounting to 10.818 per cent of total operating expenses, will remain unchanged.

The items, "renewals of rails," "renewals of ties," and "repairs and renewals of bridges and culverts," may be conveniently grouped. In the aggregate, these on the average steam operated railroad amount to 6.33 per cent of the total cost of operation. From the best study which we have been able to make of the detailed factors comprised under these three items of the classification, it would seem that under electric operation they should be reduced about one-fourth; in other words, they should approximate 5 per cent of the total operating expenses.

The cost of track-maintenance is increased by reason of the electric bonding of the rails. This bonding, including the cost of special bonds necessary where an automatic track-signal system is used, will cost about \$500 per mile under average conditions. Its cost of inspection and maintenance should not exceed \$50 per mile of single track per annum.

The annual cost of "renewals of rails," "renewals of ties," and "repairs and renewals of bridges and culverts," averages

*Extracts from a paper presented at the 213th meeting of the American Institute of Electrical Engineers, New York, January 25, 1907.

†In assuming the use of the single-phase system we are not condemning other systems. The three-phase system has not received from American engineers in general, that degree of consideration which its possibilities and demonstrated advantages justify. Its use, at least on mountain-grade divisions, can be supported by very strong arguments.

in the United States \$400 per mile of track, which as above stated, is 6.633 per cent of average operating expenses, under steam operation, and for equal trains, as we have estimated, 5 per cent for electric operation. The effect of the cost of track-bonding, therefore, would increase the items under consideration by about one-eighth, which is equivalent to an increase of 0.8 per cent in operating expenses. To avoid possible confusion, we include the cost of "repairs and renewals of track bonding" as a separate item in the column "Estimated Cost of Operation by Electricity."

Under the general conditions which will govern where electricity is substituted for steam in railway operation, there can be no doubt that the substitution will result in a material reduction in the cost of maintenance of rails, ties, bridges, and culverts. In this substitution electric locomotives will be used for freight traffic, while for passenger traffic locomotives will be eliminated ultimately and multiple-unit car equipments employed.

The hammer-blow upon rails is largely and in some cases wholly avoided by the adoption of electricity.

In view of the fact that our railways have been spending large sums of money to increase the stability of the roadbed, to strengthen bridges and culverts, and to maintain rails in position upon the ties, the advantage which the electric locomotive possesses in its higher ratio of tractive effort to weight is important, even in freight traffic at low speed.

Reverting to Table I, item 5, "repairs and renewals of fences, road-crossings, signs and cattle-guards," will not be changed by the adoption of electricity.

Item 6. "Repairs and renewals of buildings and fixtures," includes repairs and renewals of engine houses and shops, also water tanks and coal-handling apparatus. Under electric

NOTE.—It is customary with some railroads using electric equipment to include under the general heading "Maintenance of Equipment," the maintenance of the power plant and electric transmission systems. Both of these, however, are more conveniently treated by including them in the cost of electric power delivered to the overhead trolley system or third rail.

negligible in our consideration of the general problems of comparative expenses of steam and electric service.

Item 9. "Stationery and printing" will not be changed.

Item 10. "Other expenses" we may assume will not be affected.

Maintenance of Way and Structures.

Under the general heading, "Maintenance of Way and Structures," the classified statement of operating expenses of a railroad electrically equipped includes the following items in addition to the foregoing:

a. "Repairs and renewals of track bonding."

This has been referred to in our discussion of Item 2, 3, and 4, and it is included in our tabulated statement as a separate item amounting to 0.8 per cent of operating expenses.

b. "Repairs and renewals of overhead or third-rail construction."

From detailed calculations of the cost of high class overhead construction, where two tracks are to be equipped the cost of overhead construction is approximately \$10,300 per mile. This includes trolley conductors equivalent to No. 0000 wire, B. & S. gauge, insulated for 11,000 volts alternating, and supported by steel cables, carried by substantial steel bridges set in concrete, and spanning the tracks. For single-track work using steel poles and brackets and catenary support, the cost closely approximates \$4,800 a mile.

Of the total line mileage of the United States in 1905, amounting to 216,974 miles, approximately 0.4 are in double track, including yards and sidings for single-track lines, and 0.6 are single-track.

The grand average cost of overhead steel construction of the type considered, therefore, closely approximates \$5,000 per mile of track. In this case, our estimate of the annual cost of "repairs and renewals of overhead construction" cannot rest directly upon actual experience, since practically no overhead construction of this character is in use under the conditions of railway service. We may, however, base conclusions which should be reasonably correct upon consideration of first-class overhead trolley construction such as is used by our best interurban lines. Some light is also thrown upon the subject by extensive experience in the operation of high-potential transmission circuits, and the experience of the Valtellina line is particularly instructive.

Light steel bridges, set in concrete, subject to the comparatively slight strains involved in supporting the light conductors required, should last almost indefinitely if kept properly painted. The absence of smoke and gases from locomotives favors their long life. The cost of these steel bridges and poles is a large part of the overhead construction.

The wear of the trolley wire will depend upon density of traffic, but its original cost is only \$700 a mile, and judging from the experience of ordinary trolley lines and the results obtained on the Valtellina its life should be long.

The steel catenary cables supporting the conductor being well galvanized should last many years without renewals.

Breakage of insulators, such as are now available, will not constitute a large item of expense.

As regards life of steel structures, it is instructive to note the fact that much of the structure of the Manhattan elevated lines still in use is more than 30 years of age, and is apparently unimpaired notwithstanding the heavy and frequent traffic which it has carried and still carries.

It is probable that engineering opinion in regard to the amount which should be allowed for "repairs and renewals of overhead construction" under consideration will not be unanimous, but taking into account all of the factors which appear to affect the problem, it is our judgment that the amount required should not exceed \$150 per mile of track per annum. This is equivalent to \$210 per mile of line per annum, the average ratio of track-mileage to line-mileage being 1.4 to 1.

The increase in operating expenses due to this item is about 3.25 per cent of the average operating expenses per line-mile in the United States for the year 1905 being \$6,451.00.

It is, of course, possible to erect a much cheaper form of construction if wood poles be used. Though the first cost of such construction is low, it involves repairs and renewals constituting a much larger percentage of its cost than in the case of the steel bridge and pole construction set in concrete. The annual effect upon operating expenses with this type of construction as an average figure may be expected to approximate 2.5 per cent.

"Maintenance of Equipment."

Item 11. "Cost of superintendence" will not be changed.

Item 12. "Repairs and renewals of locomotives" amounts to 7.509 per cent of the average operating expenses of our steam railroads.

operation. It is our opinion that this item will be reduced from 2.366 per cent to about 1.3 per cent of the total annual operating expenses.

Item 7. "Repairs and renewals of docks and wharves," obviously will not be affected.

Item 8. "Repairs and renewals of telegraph." It is probable that this item will be somewhat increased in general where electric operation is adopted. The effect upon the operating expenses, however, is so slight as to be practically

As regards "repairs and renewals of electric locomotives," actual experience to date is not sufficient to justify us in fixing a figure for this item which can be regarded as established. There is, however, evidence sufficient to justify an estimate which in the average case should be approximately correct.

Before considering data based upon experience, it is pertinent to remark that a moment's consideration of the constituent details of mechanism, their relative complexity, and their respective functions, leads directly to the conclusion that the repairs and renewals of an electric locomotive should be very small as compared with the same item of expense in the operation of a steam locomotive.

Summarizing data from six examples of electrical operation, we have the following costs per mile:

	Repairs of electric equipment	Tractive effort, 20% adhesion.	of equivalent electric locomotive. Estimated.	
Manhattan Railway	22,000 lb...	0.5c.		
Subway train.....	33,000 lb...	0.7c.		
Wilkensbarre & Hazleton R. R.....	17,000 lb...	0.38c.	(actual)	
Lackawanna & Wyoming Valley R. R.	14,000 lb...	0.84c.	"	
Niagara Buffalo & Lockport R. R....	12,000 lb...	0.79c.	"	
Rete Adriatica-Valtellina line...				} Complete cost of maintenance of locomotives and cars.
Freight locomotives.....		1.6c		
Passenger cars.....				

It may be conceded freely in respect to the foregoing data that they are neither sufficiently comprehensive in scope nor extended in respect to duration of service to justify definite and final conclusions.

Taking into account all of the various considerations which must affect the conclusions in the general case, so far as we have been able to gather them, we are of the opinion that for equal draw-bar pull, the repairs and renewals of electric equipment of locomotives, assuming good design and construction according to present standards of the art, should not exceed 1 cent per locomotive-mile, and will probably approximate 0.9 cent per locomotive-mile.

Taking the higher figure, it is evident that the substitution of electric equipment for all parts of a steam locomotive other than frame, wheels, axles, cab, and other parts which are common both to electric and steam locomotive construction, a very great saving is effected. We have been unable to fix with satisfactory exactness a figure representing the average cost of repairs and renewals of these parts, but it would seem liberal to allow 1.5 cents per locomotive-mile, this being equivalent to an allowance of something over \$400 per annum per locomotive. Taking this figure and adding the estimated cost of repairs and renewals of electric equipment, we have 2.5 cents per locomotive-mile as the estimated total cost of repairs and renewals of electric locomotives, performing the average work now done by steam locomotives.

Item 13. "Repairs and renewals of passenger cars." In cases where electric locomotives are substituted for steam locomotives, there should be some reduction in this item. Painting should be considerably reduced by reason of the elimination of smoke. The life of the upholstery and interior decoration of the car will be increased.

Item 14. "Repairs and renewals of freight cars." This item will be favorably and very materially affected if it should ever prove practicable to operate heavy freight trains by locomotives located at intervals throughout the trains and controlled by the multiple-unit system.

Assuming that the methods of train operation remain the same, the adoption of electricity will still effect a reduction in the cost of Item 14, and for two reasons, viz.:

1. The practical elimination of damage by fire which now frequently is superimposed upon damage caused by collision or derailment.

2. Reducing the wear and tear of wheels and brake equipment in descending long grades, by reason of the opportunity afforded to break the trains by causing the motors to operate as generators.

In the way of an estimate, nothing more definite than a guess based upon consideration of probabilities, and the views of various operating officials, can be advanced; but in the opinion of the writers the general substitution of electricity for steam operation in freight service should reduce this item from 7.657 per cent to something like 6 per cent of operating expenses.

Item 15. "Repairs and renewals of work cars," will not be changed materially.

Item 16. "Repairs and renewals of marine equipment," obviously will not be changed.

Item 17. "Repairs and renewals of shop machinery and tools," will be reduced under electric operation since the repairs of locomotives will be radically decreased as shown and since the tool equipment required for the electrical machinery is materially less expensive and varied.

It would seem reasonable to expect that this item would be reduced from 0.662 per cent to about 0.5 per cent of total operating expenses. Of course a large proportion of the shop machinery and tools are for car repairs.

Item 18. "Stationery and printing," will not be changed.

Item 19. "Other expenses." Other factors comprised are comparatively small and it is evident that the ability to use electricity for light and power purposes in shops, roundhouses and offices produced at a works cost of 0.6 cent and delivered to the point of consumption at a figure which on the average will approximate 0.75 cent will effect a material reduction in this item. We estimate that it will be reduced to about 0.4 cent.

Conducting Transportation.

Item 20. "Superintendence," will not be changed.

Item 21. "Engine and roundhouse men," includes in addition to the engine crew, round-house men whose work, of course, is chiefly in connection with the cleaning and maintenance of the engines. This item averages for the railroads of the United States 9.451 per cent of the operating expenses, of which 91 per cent, or about 8.6 per cent of the operating expenses are for enginemen and for firemen. Of this 8.6 per cent approximately 5.5 per cent is for enginemen and 3.1 per cent for firemen.

It would seem that there can be no question of the reasonableness and safety of entrusting the operation of an electric locomotive to one man, provided the control system is equipped with effective appliances arranged to cut off the power and apply the brakes in case the motorman's hand leaves the handle of the controller.

As regards the wages of the engineman, the Manhattan Railway decided to pay its motormen the same wages which it had paid its enginemen. The great majority of electrically equipped railways operating under conditions similar to the Manhattan, however, pay their motormen wages comparable to the wages of the men who operate street cars rather than to the wages of locomotive enginemen.

It is impossible, of course, to fix with definiteness a figure representing the wages of the motorman in railway service as compared with those of the engineman whom he may succeed, but it seems reasonable to assume that under average conditions the services of thoroughly competent motormen can be obtained at a figure which will represent a reduction of 1 per cent in operating expenses, making this item 4.5 per cent instead of 5.5 per cent.

The expense for roundhousemen, which under steam operation is about 8.5 per cent, will be greatly reduced both by reason of the reduction in the number of locomotives required for a given service and also by reason of the demonstrated less cost of maintenance per locomotive unit. It is entirely liberal to allow for this item one-fourth of its cost in steam operation, the saving here effected being equal to 0.64 per cent of the average operating expenses of steam railroads in the United States.

The estimated cost of the item under consideration, therefore, is 4.71 per cent of total operating expenses.

Cost of Fuel and Current.

Item 22. "Fuel for locomotives." One of the marked economies resulting from the substitution of the electric motor for the steam locomotive in railway operation is in the reduction of the fuel account. The cost of fuel upon the average steam railway in the United States for the five years, 1901 to 1905 inclusive, constituted 11.292 per cent of total operating expenses. The aggregate cost in 1905 was \$156,429,245.

The following figures show comparative fuel consumption upon the Manhattan Railway during the year ending June 30, 1901, when steam locomotives were employed and during the year ending June 30, 1904, when electricity was used. During the period first mentioned one pound of coal produced 2.23 ton-miles, if the weight of the locomotive be included, and 1.5 ton-miles, if the weight of the cars only be considered.

During the latter period (electric traction) one pound of coal burned at the power house produced 3.85 ton-miles, excluding weight of locomotives; therefore, the ratio of ton-mileage per pound of coal in favor of electric operation was 2.57 to 1. Including weight of locomotive it was 1.72 to 1.

The average speed under electric operation was approximately 2 miles an hour greater than that attained by steam.

and if correction be made for this difference the ratio of ton-mileage per pound of coal excluding weight of locomotives is approximately 3 to 1, and including locomotives 2 to 1 in favor of electric traction. It should be noted also that in this case the coal burned at the power house was of lower grade, and therefore less expensive than that used by the locomotives, and it is reasonable to expect that in general electric traction will mean utilization of cheaper fuel.

In the case of the single-phase, 25-cycle motor, assuming the average length of run for freight trains to be 15 miles and for passenger trains 20 miles, we have calculated that of the energy delivered to the locomotive approximately 86 per cent will be effective for traction in the case of the passenger locomotive, which is gearless, and about 84 per cent in the case of the freight locomotive, which uses single-reduction gear. Combining the two, it is safe to say that of the energy supplied at the bus-bars in the power house not less than 75 per cent will be effective for traction in the average locomotive equipped with this apparatus.

The cost of a kilowatt-hour effective for traction, therefore, is 0.8 cent and the cost of a horse-power hour effective for traction about 0.6 cent of which 0.35 cent is for fuel when coal of 14,000 B. t. u. per pound, costs \$3.00 per ton of 2,240 pounds, and 0.25 cent is for other power-house supplies, power-house labor, and maintenance of power-house equipment.

As we have stated, the railroads of the United States in 1905 used coal costing \$156,423,245. Basing our calculations upon the statistical facts and the assumptions noted, we estimate that for the operation of the entire freight and passenger service of the United States as existing in 1905, the aggregate energy required at bus-bars of power houses would approximate 12,500,000,000 kilowatt-hours per annum.

At 0.6 cent per kilowatt-hour the total cost of energy for traction, for the operation of all auxiliaries, and for the supply of light and heat to passenger trains would closely approximate \$76,000,000 per annum. This figure represents a saving of about \$80,000,000 as compared with the coal used by steam locomotives in the year 1905.

Referring to the table, the average cost of this item for 5 years, viz., 11.292 per cent, would be reduced by electric traction to 5.533 per cent.

Item 23. "Water supply for locomotives." This item is eliminated if electricity be substituted for steam.

Item 24. "Oil, tallow, and waste for locomotives." This item should be considerably reduced. We assume that it will be reduced to 0.25 per cent.

Item 25. "Other supplies for locomotives." We make no change in this item.

Item 26. "Train service." This item is not changed.

Item 27. "Train supplies and expenses." This item among many others includes the following which will be changed by the substitution of electric motive power, viz.: "Heating, lighting, cleaning and lubricating cars, including the cost of supplying and pumping gas into cars."

In discussing item 22, we have included in the estimate of electric power required energy sufficient to light all cars three hours out of every twenty-four. We have also included energy sufficient to heat all passenger trains by electricity an average of three months per annum. Both of these are important items. The cost of cleaning the cars should also be reduced by the elimination of smoke and cinders from the locomotives. All things considered, we believe it is fair to assume that under electric operation this item will approximate 1 per cent. of operating expenses.

Item 28. "Switchmen, flagmen, and watchmen" will not be changed.

Item 29. "Telegraph expenses." Telegraph circuits being arranged with reference to the power circuits, or equipped with one or another of the devices which have been suggested as preventives of difficulties resulting from inductive effects of the power circuits, it might be assumed, perhaps with safety, that item 29 would not be changed, but we are inclined to the opinion that there will be a slight increase in the cost of this item even under the best plans heretofore proposed, and we therefore increase it in our estimate by 0.2 per cent.

Item 30. "Station service." Examination of the factors constituting this large item indicates no material change.

Item 31. "Station supplies." For lighting and incidental power service of this kind, equivalent to that with which railroads are now apparently satisfied, the change would undoubtedly mean reduction in cost. We will let it stand as it is, however, and would point out the fact that without increasing the cost of this item, a great improvement in facilities for handling freight at docks and wharves and for lighting passenger stations and yards will result from the substitution of electric power.

Items 32, 33, and 34, viz., "switching charges, balance,"

"car per diem and mileage, balance," and "hire of equipment, balance," will not be changed.

Item 35. "Loss and damage." For reasons which have been referred to in our discussion of the subject "Safety," it is clear that there should be a material reduction in the charges for loss due to destruction of freight, etc.

Another saving will result from the practical elimination by reason of damage of fire, which now not infrequently is caused by sparks from locomotives.

These savings will be offset to some extent by damage due to telegraph, telephone, or other wires coming in contact with the power circuits of the railway, unless reasonable care be exercised in preventing such accidental contact by the adoption of proper precautions when the electric equipment is installed.

In our estimate we have reduced item 35 to 0.75 per cent.

Item 36. "Injuries to persons." "This account includes all charges on account of employes or other persons killed or injured except lawyers' fees and court expenses."

For reasons referred to under the heading "Safety" some reduction in the number of passengers and employes killed and injured in railway accidents may be expected to result from the use of electricity. The risk of fire following collision being materially reduced, we should anticipate a relatively greater reduction in the number of passengers and employes killed in accidents caused by collision or derailment than in the number injured and a reduction in the average severity of non-fatal injuries may also be expected. As regards the expenses included under item 36, we have no data indicating how these are divided other than the fact that the railroads apparently were put to little if any expense on account of about 80 per cent of those persons other than passengers and employes who were killed and injured. While it is probable that a large part of the expenditures were on account of passengers killed and injured, and while any reduction in fatal and serious accidents to passengers therefore would materially affect this item, we have thought it best in the absence of satisfactory data to leave it practically as it stands, our estimate being 1 per cent.

Item 37. "Clearing wrecks." In our opinion this item will be reduced under electric operation for reasons which have been sufficiently indicated in what we have said in regard to item 35. It would seem that 0.2 per cent is a fair estimate of its probable amount.

The following items will not be changed:

Item 38. "Operating Marine Equipment."

Item 39. "Advertising."

Item 40. "Outside agencies."

Item 41. "Commissions."

Item 42. "Stock yards and elevator."

Item 43. "Rents of tracks, yards and terminals."

Item 44. "Rents of buildings and other property."

Item 45. "Stationery and printing."

Item 46. "Other expenses."

General Expenses.

As regards the several items included under the heading "General Expenses," the adoption of electricity will cause no material change.

Our approximate estimate of the expenses chargeable to operation if electricity were in use today for the operation of all the railways in the United States, as discussed in the foregoing pages, is recorded in detail, item for item, in the last column of the tabulated data in Table I; these data with the exception of this column of estimates being the official records of the reports of the Interstate Commerce Commission. When considered in detail, the estimates are naturally subject to criticism more or less destructive, as in respect to many items we have not found opportunities to secure and investigate the great mass of detailed data showing in segregated form the scores of factors which are included in the aggregates appearing as single items in the summarized table of operating expenses; but while recognizing fully the imperfections and incompleteness of the attempted comparative analysis, we believe that the conclusions reached are correct within a reasonable degree of approximation.

Conclusions.

According to our estimate, if all the railways of the United States were today operated by electricity using the single-phase alternating-current system at the potential adopted for the equipment of the New Haven railroad, the energy required for operation being developed by power plants such as are today in extensive use and transmitted at potentials well within limits established in practical service, and if the rolling stock equipment consisted of locomotives and multiple-unit trains fitted with motors and control appa-

ratus no better than the best which now exist, the aggregate cost of operation which in 1905 amounted in round numbers to \$1,400,000,000, would be reduced by about \$250,000,000.

To accomplish this result, power plants delivering about 12,500,000,000 kilowatt-hours per annum would be required. Assuming the radius of transmission from power houses to be 150 miles, the load-factor in railway service should be not less than 0.75, and taking this figure it appears that power plants capable of delivering a maximum output of about 2,800,000 kilowatts will be sufficient to operate the entire railway service of the United States as existing in the year 1905. The average output required is about 10 kilowatts per mile of line and 7 kilowatts per mile of track.

In 1905 the average gross earnings of our railroads per mile of line were \$9,598, and the average operating expenses \$6,409. The foregoing calculations lead to the conclusion that high-class electric equipment now available would reduce this average cost to \$5,265. The difference is \$1,144 per mile of line, against which apparent saving must be charged the annual interest and depreciation of the power plant, the addition to permanent-way equipment, comprising overhead construction and track bonding, the transmission circuits, and the substations with their equipment. Assuming 5 per cent interest on cash cost of these items and allowing 5 per cent for a sinking fund to cover depreciation of power house with its equipment and 2½ per cent for a sinking fund to cover depreciation of the overhead construction and distributing system, the aggregate of fixed charges works out \$837 per mile of line. The saving in operating expenses, therefore, is more than sufficient to take care of the increase of fixed charges. In other words, it appears that the entire railroad system of the United States could be operated today at less cost by the electric motor than by the steam locomotive. That the railroads in general if so equipped would realize a large increase in earning power will be admitted by all who have given the subject intelligent attention.

In charging against electric operation 5 per cent cost of power plant and 2.5 per cent upon overhead construction, transmission circuits, substations, and track bonding, we have departed from methods usually adopted in financing of American railway properties. If no depreciation be charged against the increased capital account represented by the items named, the apparent saving will be materially increased.

While our estimates have led us to the conclusion that, under average existing conditions of railway operation in the United States, improved financial results would be attained by the substitution of the electric motor for the steam locomotive, the immediate and general adoption of the new motive power by our railroad companies is neither possible or desirable. It requires no argument to demonstrate the wisdom of making haste with deliberation in a matter involving interests of such magnitude as those which are tied up with the transportation systems of the United States. Recognizing the magnitude of these interests and having in mind the fact that the art of electric traction as applied upon a large scale to heavy train units is yet young, the point which we desire here to emphasize is the necessity of conservative and carefully considered action upon the part of all members of this Institute who may be called upon to advise in respect to the electrification of railways now operated by steam.

Discussion.

Extracts from that portion of the discussion relating to the second section of the paper are as follows:

Mr. W. S. Murray (N. Y. N. H. & H. R. R.)—During the year and a half that I have been connected with the New Haven road I have been able to make some rather interesting experiments with steam locomotives, of the freight and passenger types. What I have here are very accurate figures on the cost of locomotive repairs for steam locomotives, extending over a period of exactly one year, in which there were 20 passenger engines. I have divided the cost of repairs into two parts, one on the basis of locomotive miles for maintenance, and the other for purely mechanical or shop repairs. It seems that on a freight basis the steam locomotives average 6.68 cents per locomotive mile. I have included in the maintenance the following heads: Cost of oil and waste, flues cleaned, ash pan and grates cleaned, engines wiped, engines turned, engines fired, boilers washed and the cost of sand. Now, on the passenger basis, the cost per locomotive mile total is 5.6 cents as compared with 8 and 10 cents for the freight. Subdividing the passenger locomotives again into maintenance and shop repairs, the first, shop repairs, is 3.88 and maintenance 1.72. I thought with those figures in mind, it would give you an idea of what the saving will be under the electric traction method of train propulsion. I will supplement the figure which Mr. Stillwell has given, if he will permit me to do so, by one received from no less a per-

son than Mr. Potter (General Electric Company), who gave me 1.25 cents for the No. 6,000 General Electric machine, operating, I think, 50,000 miles on the test track, which were very severe conditions.

Mr. O. S. Lyford (Westinghouse, Church, Kerr & Co.)—This paper places squarely before the steam railroads of the whole country the proposition that it is profitable to adopt electric traction instead of steam.

On January 22 the Erie Railroad ran its first electric train into Rochester. This consisted of a motor car equipped with single-phase motors and multiple-unit control for operation from an 11,000-volt trolley wire.

A pantagraph trolley is used making contact with a wire supported with steel catenary construction at a height of 22 feet above the track. The 34-mile line is fed from one substation which in turn receives current at 60,000 volts from a power station 90 miles away. The conditions are in many ways almost identical with the assumptions made by the authors. Power is transmitted about 90 miles at 60,000 volts. One substation supplies 34 miles of track; 11,000 volt catenary trolley construction is used, single phase motor with multiple unity contact.

I may say that the operation of the entire equipment was perfect and fully demonstrated the sufficiency and general practicability of the system. On the return trip the vice-president's private car was hauled as a trailer resulting in a total weight of train 22 per cent heavier than that for which the motors were designed. This was on an icy, slippery rail.

The impression given by the overhead catenary construction is that it is the adequate thing for heavy railroading. An 11,000-volt trolley wire so supported is safe. The 11,000-volt wires on the car are so short and so well guarded that they are not a source of increased danger and all the other wires, housed in the usual way, and operated at only one-half the usual voltage, are unusually safe.

Referring to the tables, it seems to me that more emphasis should be placed on these tables and the deductions reached. Now the advantage to be gained by electric traction resulting from increased facility and increased loads which could be hauled have not been capitalized. Those of us who have had occasion to study different specific problems have found the adoption of electric traction, if a high-voltage trolley is used, will in no case mean an operating cost greater than the cost of steam, and in practically every specific case the saving is considerable. Now, when we come to allow for the advantage gained by increase of service we at once appreciate what can be accomplished, and it seems to me that we as engineers ought not to go into too much discussion of the details, but place emphasis on the one great fact, that almost every specific case that can be presented bears out the conclusion of this paper, which is based on the problem of the United States as a whole, namely, that electric traction can be adopted with great advantage by the railroads.

Mr. C. L. du Muralt (Consulting Engineer, New York)—

I believe the great advantage of the electric locomotives lies principally in the fact that they are able to stand great overloads for great length of time. The curve of the steam locomotive represents practically the maximum output, because the boiler of the steam locomotive cannot for any length of time be forced above its normal rating. It is possible for ten minutes at a time to go 10 or 20 per cent above the rating, but in any case there is a limited overload capacity. An electric locomotive will be able to give for any reasonable length of time, say for one hour, 25 or 50 per cent overload, or for short times 100 per cent or more, because they have the great power house back of them and can practically develop an unlimited power.

Mr. A. C. Armstrong (General Electric Company)—I believe that with the asset we have in the electric locomotive we have reached the day when we can approach big problems in railroading with supreme confidence of winning out over the steam locomotive. It is not a case of types of apparatus, or a question of frequency. Each case has to be considered by itself. In ten years from now we will still be disputing over the question of frequency, alternating-current or direct-current operation.

Mr. William McClellan (Westinghouse, Church, Kerr & Co.)—Having passed through the experience of putting some of these 11,000-volt motors on the car and equipping it, I am very glad tonight that I can endorse and confirm some discussion which I contributed to the New York Railroad Club last year. I believe firmly the solution of the railroad problem is going to be by means of the high-voltage overhead trolley alternating-current, single-phase motor.

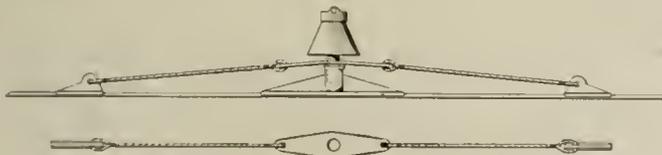

With regard to these figures, I can only say—in regard to figures in general—they should be carefully scrutinized. Westinghouse, Church, Kerr & Co., like others engaged in work of

this kind, wanted some actual figures, and we turned to the same figures Mr. Stillwell turned to, and after careful study of them we concluded that few conclusions of value could be derived from them. Therefore a new scheme was adopted. It was to take several railroads having different kinds of traffic, a division here with large passenger traffic, another division with a good mixture, and another division largely freight traffic, and, if possible, get costs on these, and in this way we could arrive at some general figures which could be relied upon; I am free to say we did have some success and did arrive at some results, but on the whole they were unsatisfactory. Our conclusions were, in regard to maintenance of way, that by including repairs and renewals of track and bonds, repairs and renewals of overhead construction, you will have about the same cost as is shown in the paper.

I do believe that we can standardize certain principal lines on which we can approach this railroad problem and hope to solve it, with electricity. There is no doubt about it. The flexibility of the motor equipment and increase of the road time is a very important item. Take the freight locomotive at the present time, making 3,000 or 3,500 miles a month; 45 per cent of its time it is on the road, about 30 per cent of the time it is in the roundhouse for repairs, and about 25 per cent of the time it is in the yard waiting for orders. These percentages can be greatly changed by the use of the electric locomotive. Another item which I think operates strongly in favor of electricity is the possibility of generating your power cheaply by locating the power plants close to coal mines, which will avoid any haulage of the coal, and also by making use of the large number of small water powers which if properly developed amount to a great asset for the railroad, water powers which would be of no use to the individual, but are of use to the railroad, because its load is distributed over a large territory.

ANCHORING TROLLEY WIRES AT SPANS.

According to the discussion by Mr. M. P. S. Sheardown in a paper read before the Dublin Local Section of the Institution of Electrical Engineers, December 6, 1906, there are four deteriorating actions which take place at these parts

Suggested Attachment to Prevent Breaking of Trolley Wires.

of the trolley wire where it joins the rigid suspensions. These cause most of the breakages:

1. The blow of the trolley wheel against the butt of the ear, part of which comes against the wire.
2. The effect of sparking which occurs at the same place, due to the trolley wheel losing contact with the wire.
3. The molecular change or crystallizing action in the wire, due to what the author has termed the damping-out of vibration in the suspended wire.
4. The bending or hinging action due to the upward pressure of the passing trolley wheels; and possibly a fifth, viz., overheating of the wire when being soldered.

The first of these can be removed by using grooved trolley wire supported by clamps, thus giving a smooth under-running surface for the wheels. This also will in a great measure prevent the wear resulting from the sparking. It is not, however, so easy to prevent the third and fourth causes for broken wires, though they may be reduced slightly by making the cars as short as possible and by the use of flexible suspensions. Neither of these methods will prevent the deadening of vibrations at the points of support and the consequent crystallization, though the effects of the bending action may be much reduced. Both of these effects will also be very much reduced by having the upward tension of the trolley wheel as small as permissible.

A method which has been suggested and reported to have given excellent results is that of anchoring the trolley wire at each support. The anchoring system as proposed consists

of a stamped steel plate with a hole in it through which the threaded portion of the insulator bolt passes. The plate to which the anchor wires are fastened is thus securely held in position at the top of the ear, but the strain of the broken wire comes directly on the bolt. On either side of the ear, as shown in the diagram, a half anchor-ear is attached to the trolley wire and is connected to the anchor-plate by wires which take up the strain and hold up the wire. If it breaks at the ear. It is stated that in one case where these were installed, out of an average of 20 accidents per month three cases only were reported in one year in which the trolley wire fell and interfered with traffic.

The cost of installing these anchors is reported as about \$60 per mile of double track, which, there can be little doubt, would be a good investment.

ADVERTISING FOR RUSH-HOUR TRAFFIC.

The down-town loop over which the elevated railroads of Chicago operate in the business district is badly over-

The Metropolitan West Side Elevated

---	---

PLEASE NOTE—If by reason of fire or other cause the Trains of the Metropolitan "L" are not running on the Loop, they will then be dispatched from the Station at Franklin and Van Buren Streets, or from the Fifth Avenue Terminal Station.

Copies of this Circular may be obtained at the General Office, 1001 Royal Insurance Building, 113 Jackson Boulevard.

Rush-Hour Advertising.

crowded; in fact, during the rush hours the trains on each of the tracks are but a few car lengths apart for the entire two miles' distance around the elevated loop structure. To call particular attention to its express service and to the central location of its Fifth Avenue terminal station and thus endeavor to relieve its loop trains of some of their rush-hour traffic, the Metropolitan West Side Elevated Railway has had quite generally circulated through the business districts of Chicago diagrams as shown in the accompanying illustration. It will be noted that the Fifth Avenue terminal station of the Metropolitan elevated is the center of concentric rings which indicate the time necessary to walk from their limits to this station. This terminal station was described and illustrated in the Street Railway Review for March, 1905, page 182.

PIPING AND POWER STATION SYSTEMS—XXVIII.

BY W. L. MORRIS, M. E.

Figure 242-(II-4) shows a water supply which is higher than the ground surrounding the building. It would seem that such a condition would, in itself, suggest that the pipe line must be watertight throughout its entire length. As an illustration, the writer has knowledge of a 30-inch tile pipe line which was carried for a distance of 4,000 feet under a country road. This line had a gradual down grade to the power house, the road at that point being about two feet lower than the water level. It is possible that the engineer who built the line thought that to supply a plant through a pipe of this size and length would cause a drop of more than two

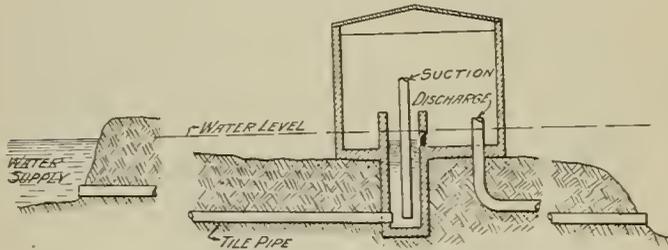

Figure 242-(II-4).

feet; or again he may have considered that cement joints in tile pipe are watertight. Such a pipe line would possibly have been quite satisfactory if it had been for irrigation purposes, as it kept the road in a very wet condition, even when the intake valves, condenser, etc., were carefully manipulated.

Where tile or other leaky pipes are used the manner of filling a trench does not enter into the seepage problem. There is nothing gained in keeping a trench tight if the pipe passing through it has openings permitting seepage. It is important to lay tile pipe so that it is well supported. This precaution should be taken if for no other reason than to prevent open joints that sand may wash into. Where the water pressure outside the pipe is equal to that inside, tile pipe will be found quite as suitable as metal and will cost much less and last longer.

For a situation such as shown in Figure 242 some form of a built-in-the-trench reinforced-concrete water conduit would be found suitable as the pressure inside would be slight and but little reinforcing be required. Such a conduit should be built by one familiar with the methods necessary for insuring watertight work, the chief requisite for such work being continuous progress after the concrete placing has been started, thus avoiding joining the fresh work with that which has set.

Another method of constructing the line shown in Figure 242, though subject somewhat to interruption through breakdown, would be to use a large cistern at the power house and a float which would electrically operate the admission valve, thus maintaining at all times a constant level in the cistern. This would avoid the rise of water to the surface of the ground and at the same time permit the use of tile pipe. The regulation can be accomplished by using a synchronous motor for operating the admission valve and a small alternating-current generator driven by a motor at the cistern. The current supply to the motor may be controlled by the float as shown in Figure 243-(II-5).

Under such conditions the pond-float operates the pair of contacts as shown supported at a. These contact points engage with other contacts when a change of water level occurs and allows current to pass to the direct-current motor operating it in either one direction or the other. The motor driving the generator shown also operates the screw, c. This withdraws the contact points which the float has caused

to engage. The pivot a may so be located to obtain any desired travel of the contacts and thus keep the variation of water level within the specified limits. The arrangement as shown in Figure 243-(II-5) is set for a variation of 4 feet in the cistern level and would have the inlet valve entirely open at low level, half way open at midpoint and entirely closed at the high-water mark. The position of the valve at any point is proportional to the water level in the cistern. This system of control is a modification of the electric damper regulator as used in power houses, except that with the damper regulator, instead of the motor driving the generator, it operates a cable connected to the damper. The contacts in the damper system are operated by the gauge of the regulator.

This method of regulation by the use of motors can be used for open waterways or for cisterns having a great difference in elevation and where the pipes connecting the source of supply with the cistern cannot be filled entirely with water. The control would be much more sensitive if the supply pipe were throughout its entire length below the water level of the pond. Then the amount of water entering the basin would exactly equal that admitted by the valve. If the demand for water suddenly be cut off, that within the pipe would not be emptied into the basin as would be the case if the pipe were not below the level of the pond.

A considerable reserve capacity must be provided if the pipe discharges above the water level of the cistern because it must then be of sufficient size to receive the contents of the pipe that would flow to it after the admission valve were closed. If the pipe were 4,000 feet long, 30 inches in diameter and half-full of water when the admission gate were closed, then 10,000 cubic feet of reserve capacity would be needed. This would represent a rise of 8 feet in the water level if the cistern were 40 feet in diameter. If the pipe were entirely below the water level, a much smaller cistern could be used. Probably the capacity of the condenser pumps would not be such that the water level in the basin could be altered as quickly as the controller could operate the valve.

So many varying conditions are met in different localities that it is impossible to say which is the most suitable material to use for the construction of large waterways. Much depends upon the soil through which the line must be

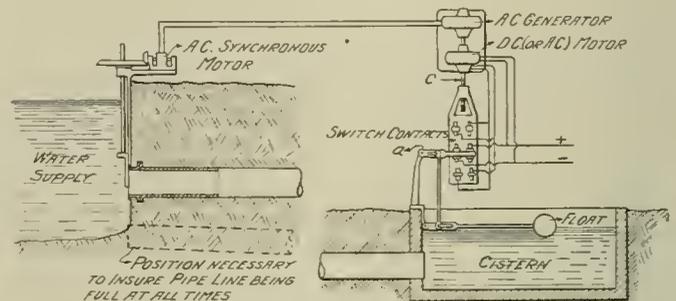

Figure 243-(II-5).

run. If the line is of considerable length,—say 100 or more feet, or of such size that a suction 16 or more inches in diameter is required, then the water should be delivered by gravity. In many cases the soil close to the water's edge is unfit for supporting building foundations. This often necessitates the placing of a power-house some distance from the water. The fact that the soil is unsuitable for building purposes makes it quite as unsuitable for building a trench and placing a waterway through it. If the plant is located alongside of a dock much difficulty may be experienced with old piles, dock timbers, etc., and since it is desirable to carry the pipe line under water the entire distance such conditions would hinder careful construction and necessitate installing a pump of sufficiently large capacity to care for the increased amount of seepage through loose ground.

Figure 244-(11-6) shows an intake constructed of sheet piling. The lower line of plank is driven inside of the upper row. Sheet piling is necessary in soft soil, both to hold back the sides and to confine the water to the desired course. The material between the walls of the trench can be removed while the planks are being driven. Struts and stringers as shown take the thrust of the banks. After the material has been removed between the walls of the trench the lower stringers, a, are placed and the bottom secured to them. Before removing the upper row of sheet piling and filling in the trench the plate, b, should be set approximately correct when driving the piling and planked over as at c.

If placed entirely below the water level, a waterway constructed in this manner will last indefinitely so long as the wood is protected from the atmosphere at all times. The planking can be made double and the waterway made secure against the pressure of the banks and material be prevented from washing through the joints of the plank. To properly carry the tile pipe it would be advisable to use this form of construction as far back from the water as the made ground extends, or at least until firm ground is reached. Tile pipe may be used inside of the sheet piling as far as the water's edge, but where it is necessary to build up a complete enclosure of wood to hold back the banks and seepage water, there is nothing to be gained by placing another conduit inside of the wooden one.

If the intake line is entirely below the water, as would be the case in Figure 244, or as in the case of a pipe line, there should be wells placed at regular intervals, about 150 feet apart along the line of the intake, to facilitate the removal of sand or other deposits which may collect in the pipe. Since they are exposed to varying conditions of moisture, these wells should be of masonry. The bottom of the wells should be at least 3 feet below the bottom of the pipe. This will permit the deposit to collect in the wells along the line, thus acting as small catch-basins. Metal steps should be built in the sides of the wells and the tops should be fitted with iron manhole rings and covers.

There have been intake lines built of $\frac{1}{4}$ -inch steel or iron plate with flanges at the end for bolting the sections together. The most serious objection to this type of construction is its short life and the fact that the sections are built in lengths of about 16 feet—which are difficult to handle in the trenches. Such long sections necessitate extreme care in maintaining a perfectly straight line of trench and a special arrangement of struts, etc., must be provided to permit the lowering of the pipe.

(To be continued.)

The Ohio state railroad commission has let a contract to the Columbus Lithograph Company for the printing of the state railroad maps for 1907. The maps will show all steam and electric roads in operation and in process of construction in the state.

The report of the Connecticut railroad commissioners for the year ending June 30, 1906, shows that the total number of fare passengers carried by electric railways in the state was 121,322,906, an increase of 18,428,746, or 18 per cent, over the previous year. The gross earnings of the electric railways were \$6,349,202.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL.B.

DUTY OF MOTORMAN SEEING DOGS FIGHTING OR OTHERWISE IN DANGER ON TRACKS.

Harper v. St. Paul City Railway Co. (Minn.), 109 N. W. Rep. 227. Oct. 19, 1906.

When dogs are engaged in fighting upon street railway tracks, and are apparently oblivious to an approaching car, the motorman, upon discovering them in a position of peril, the supreme court of Minnesota holds, is required to exercise reasonable care by using proper signals or checking the speed of his car, to avoid their injury. Persons in charge of street cars, the court says, should not be required to slow down merely because dogs may be running in the vicinity of, along, or across the tracks. Under such circumstances, motormen may well assume that dogs will get out of the way. However, under the laws of this state dogs are property, and, whether rightfully or wrongfully upon the tracks, cannot be ignored when discovered in a position of danger. In this instance the dogs were engaged in a fierce fight, and their attention was not likely to be attracted by the noise alone of the approaching car. If the motorman was aware of their situation, then he should have taken reasonable precaution to avoid injury to them. There is no hardship in such a rule, and it has been generally applied, or recognized, in this class of cases.

DUTY TO EXCURSIONISTS CARRIED FREE—WHAT CONSTITUTES A COMMON CARRIER, ITS FRANCHISES AND DUTIES—WHO IS A PASSENGER.

Indianapolis Traction & Terminal Co. v. Lawson (U. S. C. C. A., Ind.), 143 Fed. Rep. 834. Feb. 6, 1906.

It having been agreed or understood that the company would give the delegates to a convention of women a free street-car ride, the United States circuit court of appeals, seventh circuit, says that this implied that it would furnish safe and suitable track, cars and appliances, the necessary power, and to apply that power skilled employees, who should be under the control of the company. The company was charged with the custody and care of human lives in a service voluntarily assumed, and it was of no importance whether it was in the technical relation of common carrier or not.

A public, common carrier of passengers is distinguished from private carriers by the franchises conferred upon it, and the obligations, restrictions, and liabilities with which it is charged, all flowing from considerations of public policy. It must carry all alike, and for a reasonable compensation, furnish reasonable accommodations, must continuously operate its line, and submit to reasonable regulation. It has the franchise of taking tolls, and, if a street railway corporation, the franchise of laying tracks in the streets, of stringing wires and setting poles, and the right of way over all private means of transportation. Owing these public duties, possessing these public franchises, and having the burden of caring for innumerable human lives, it is justly held to the highest degree of care and skill. This burden the company was bearing, and these public franchises it was employing, in carrying these delegates on this free ride.

A passenger is one who undertakes, with the carrier's consent, to travel in the carriage of the latter, otherwise than in its service. It is the existence of a contract of carriage, express or implied, which distinguishes a passenger from an employe, a licensee, an invited person attending on a passenger, and a trespasser.

In view of these characteristics of common carrier and passenger, what was the relation of the parties? At the very least the company was responsible for ordinary diligence, and liable for want of ordinary care. The trial court held, as matter of law, that the company was not a com-

mon carrier as to one of the women, who was hurt by a collision of two of the cars, was liable only for a want of ordinary care, and that the burden of proof to show negligence was on the plaintiff. This was a position sufficiently liberal to the railway company.

AN UNFENCED INTERURBAN ELECTRIC RAILWAY WHEREVER LOCATED IS LIABLE AS A "RAILROAD" FOR DOUBLE DAMAGES FOR LIVE STOCK KILLED.

Riggs v. St. Francois County Railway Co. (Mo. App.), 96 S. W. Rep. 707. June 5, 1906.

An unfenced interurban electric railway carrying passengers, express, mail, and some freight, the St. Louis court of appeals holds, is liable for double damages for killing live stock, under section 1105 of the revised statutes of Missouri of 1899 making railroads liable therefor. It says that it finds that the railroad in question, though incorporated under the provision relating to the organization of street railway companies, is within both the letter and spirit of the statute, and therefore it is manifest that the legislature intended that railroads of this class, when engaged in operating their cars through the country between towns, should fence their tracks as other railroads are required to do under like circumstances. The fact that the railroad ran along the north edge of the public road did not operate to relieve the railroad company from its duty to maintain fences. The county court could grant no authority to the company to operate its road in a manner violative of this positive statute which would operate to relieve it from the duties thereby imposed, and its duty to maintain fences remains the same wherever it is located, and if such a fence in the highway constitutes a public nuisance, or if the railroad itself constitutes a public nuisance, it is immaterial so far as this case is concerned.

DUTY OF PERSON IN CHARGE OF AN AUTOMOBILE OR OTHER VEHICLE AT ELECTRIC RAILWAY CROSSING—CONTRIBUTORY NEGLIGENCE.

Garrett v. People's Railway Co. (Del.), 64 Atl. Rep. 254. Mar. 13, 1906.

A person in charge of an automobile or other vehicle, approaching a railway crossing with which he is familiar, is bound, the superior court of Delaware says, through Boyce, J., charging jury, to avail himself of his knowledge of the locality and the presence of danger, and to exercise that degree of caution which an ordinarily careful and prudent person would exercise under all the conditions. The traveler in his automobile or vehicle should not approach such crossing at a greater speed than is consistent with safety. He should have his team or automobile under control, and be on the lookout for an approaching car, so that he may, the servant of the car being in the exercise of due care, avoid collision with the car; and where he sees, or by the exercise of reasonable care might see, an approaching car, he, as well as the servant of the car, should exercise reasonable care and diligence to avoid injury.

The law governing the use of public streets by automobiles is the same as that governing the use of such streets by carriages or other ordinary vehicles; and their use upon the public streets and the speed at which they may be driven should be consistent with safety.

Again, it is said: If you find that the plaintiff was unfamiliar with the safety appliances, and by reason thereof was unable to use them, or, being familiar with them, he failed to use in a reasonable and prudent manner the brakes of his automobile to prevent a collision with the car, or that he was driving his automobile at a greater rate of speed than one mile in seven minutes through a built-up portion of the city of Wilmington where the houses are and average less than 100 feet apart, or if you find that as he approached the crossing at Orange street he saw, or by looking could have

seen the approaching car in time, by the exercise of reasonable diligence, to slacken the speed of or to stop his automobile before it collided with the car, and he failed to do so, he was guilty of negligence; and if such negligence entered into or contributed to the collision at the time of the injuries complained of, it would defeat his right to recover in this action.

PERMISSION TO CROSS STEAM RAILROAD AS CONSIDERATION FOR CONTRACT ASSUMING RESPONSIBILITY AT CROSSING—RIGHT GIVEN BY CONSTITUTION APPLICABLE TO STREET (ELECTRIC) RAILWAYS—WHEN COMPENSATION MUST BE PAID.

Owensboro City Railroad Co. v. Louisville & Nashville Railroad Co. (Ky.), 94 S. W. Rep. 22. June 7, 1906. "Not to be officially reported."

By contract the electric railway company was granted permission to cross, with its street railroad, the road of the other company at a point south of the city of Owensboro. The contract contained the following provision: "And this permission is given upon the further consideration that the trains of the said Louisville & Nashville Railroad Company shall have precedence over the crossing. Said Owensboro City Railroad Company hereby agrees that all of its cars shall be stopped before passing over the crossing, and its motormen, drivers, and other employes shall see that the track is clear before crossing. And said Owensboro City Railroad Company shall be liable for all damages to people or property by reason of failure of its employes to stop its cars, and see that the track is clear before passing the crossing."

The steam railroad company sued the electric railway company for damages to a locomotive in a collision alleged to have been caused by the electric railway company violating its agreement by running one of its cars over the crossing without first stopping and without its employes first looking to see if the track was clear. But the electric railway company contended, among other things, that the contract was invalid for want of consideration.

In affirming a judgment for the steam railroad company, the court says that it is true that certain cases decide that the provision of section 216 of the state constitution that "all railway, transfer belt lines and railway bridge companies shall allow the tracks of each other to unite, intersect and cross at any point where such union, intersection and crossing is reasonable or feasible," is applicable to street railways as well as steam railroads. The street railway company unquestionably had the right to run its line across the track of the steam railroad company, but the question was did it have the right to do so without making just compensation to the latter for the right of way appropriated through its property? The court thinks not. The cases referred to were where crossings were made on streets and public highways, where the property belonged to the public and not to the railroad. The case here was different; the crossing was not on a street of a town, city, or on a public highway; it was in the country, and crossed the right of way of the steam railroad company. The section of the constitution referred to conferred upon the electric railway company the right to cross the steam railroad company's right of way and track, yet this right could not be exercised in a case like this, without first making compensation to the owner. In the cases referred to the railroads did not own any right of way along the streets or highways; they had been permitted to occupy them by those in control of the highways, and the roads attempting to cross, when given the right by those in control, had the same right in the highways as the roads that were first constructed thereon. In the court's opinion, there was a consideration received by the electric railway company sufficient to uphold this contract, at least to the extent it was sought to be enforced in this action.

News of the Week

Chicago Traction Ordinances Passed.

A few minutes before four o'clock in the morning on February 5 the city council of Chicago, at the end of an all night session, passed the Chicago City Railway and the Chicago Railways Company (Union Traction) ordinances. The vote stood 56 to 13. Mayor Dunne was very much opposed to the passage of the ordinances before the spring election; he is a candidate for re-election. His supporters in the council raised many objections and offered numerous amendments, but they were voted down in almost every instance. The city council has never before had such a meeting. About 50 amendments to each measure were submitted. After the final votes on the complete ordinance had been taken a reconsideration of the votes was asked. These motions were tabled, which has the effect of preventing the retraction of the ordinances.

Although some opposition to the consideration of the ordinances on Monday had been expected, comparatively little, beyond that which came from Mayor Dunne and his personal supporters, developed. The Federation of Labor passed resolutions protesting against action by the council before the spring elections and had a delegation present at the council meeting.

Mayor Dunne is chagrined over his failure to secure a postponement of action, and probably will exercise his veto power at the meeting of the council on February 11. To pass the ordinances over the veto will require a vote of only two-thirds of the aldermen, and the result of Monday's session indicates that the supporters of the measures have a safe majority over the necessary number. The mayor issued a statement in which he said:

"The uncalled for and indecent haste with which these ordinances were rushed through at high pressure in an early morning session of the council, called immediately after a high pressure session of the committee on local transportation, at which a large number of amendments were offered without being printed, and at which a most important agreement purporting to settle the General Electric Railway obstacle was for the first time presented, will not, in my judgment, tend to assure the people that the ordinances fully safeguard the public interests in the matter of provision for the municipalization of the street railway systems. Legislation jammed through in this hurried and precipitous manner is not likely to be regarded with confidence by the public at large."

Walter L. Fisher has resigned as special traction counsel to Mayor Dunne because the mayor's plan to postpone action on the ordinances did not have his approval. The city council committee on local transportation immediately engaged Mr. Fisher to act as its adviser on traction matters.

The referendum amendment which was incorporated in the ordinances provides that they shall not be effective unless a majority of voters approve them at the election on April 2. Mayor Dunne contends that this clause is so worded that the measures will be operative even without this approval.

The board of election commissioners received on February 5 from nine voters, acting for themselves and as the political committee of the United Societies for Local Self Government, a formal protest against the emergency referendum petition. They claim that the "alleged emergency referendum petition is illegal and invalid and contrary to the statute" which provides for the submission of public policy questions to voters. The reasons on which their objections are based are: That it contains three propositions on the same petition; that it is not signed by 25 per cent of the registered voters of the city; that it contains forged signatures and the names of fictitious persons, and is signed by aliens, non-residents and minors; and that some of the petitions contain certain propositions and others contain different propositions.

The board of election commissioners has taken official cognizance of both of the petitions filed on January 31. The committee on finance of the city council estimates that it would cost from \$10,000 to \$15,000 to investigate the "public policy" lists, and it will report this fact to the city council without recommendation. Isaac N. Powell, the chief clerk of the board of election commissioners, said that the board will decide no questions affecting either referendum until any objections which may be filed are heard. After the objections to the emergency referendum petition have been considered, those who filed the petition will be given a hearing.

The election commissioners take the position that under the law they must place the referendum questions on the "little ballot" unless objections which affect the legality of the petitions are raised and sustained. In this instance they anticipate that in any event the clause providing for a vote on the ordinances will be printed. The public policy petition has 184,000 names or more than double the required number. The other has 107,000 signatures. Under the ordinance as passed by the city council, the board of election commissioners, however, would have no power to submit this referendum at the April election, if by any contingency both petitions should be held invalid.

The petitions which were filed with the election commissioners on January 31 are entitled the "Public Policy Petition" and the "Emergency Referendum Petition." The first provides that there shall be submitted to voters the ordinances substantially in the form of the pending ordinances reported to the city council on January 15 authorizing the Chicago City Railway Company and the Chicago Railways Company, respectively, to construct, maintain and operate street railways and providing for the purchase thereof by the city council or its licensee.

The other petition contains three clauses, the first of which is identical with the wording of the public policy petition. The second clause is entitled "For a municipal railway system, one city, one fare, versus franchises." It reads: "Shall the city council proceed by condemnation under the Mueller law to acquire and equip a complete, modern, unified street railway system, with one fare and universal transfers for the entire city, instead of passing the pending franchise ordinances?" The third clause has no bearing on the traction situation; it refers to a repeal of the Illinois Sunday blue laws of 1845.

One of the principal features included in the settlement of the situation is an agreement with the General Electric Railway Company. It was read to the council and guarantees that the Chicago City Railway Company will take over the rights of the General Electric Railway Company if the ordinance is passed and approved. The agreement provides that John A. Spoor and Thomas E. Mitten for themselves and associates will deposit with the First Trust and Savings Bank certain bonds, stock certificates and promissory notes of the General Electric company. The bank as trustee will secure to the city the power to cancel the General Electric franchise if the City Railway ordinance becomes operative before July 1, 1907. These securities are to be held in trust until the tracks of the General Electric have been removed from the streets and all its rights have been annulled. After that the securities are to be returned to Mr. Spoor and Mr. Mitten. In the event that the ordinance does not become operative before that date, the securities are to be returned to the two men. Another amendment alters the two ordinances so that they apply to any changes in the city limits in the future.

The Chicago Real Estate Board has appointed a committee to urge and work for the approval of the ordinances at the election.

The ordinances provide for the expenditure on improvements of \$40,000,000 within three years. Twenty-three through routes without change of cars between the three sections of the city will be established. The traction companies may be required to furnish \$5,000,000 for a downtown municipal subway. The municipality will have the right to take over the systems on six months' notice by reimbursing the companies for the value of \$50,000,000 agreed upon, plus the money to be expended for improvements. Fifty-five per cent of the net receipts from operation are to be paid to the city annually.

The directors of the Chicago Railways Company met on Friday and passed a resolution formally accepting the amendment to their ordinance which provides for a referendum.

Cincinnati Traction Officials Indicted.

President W. Kesley Schoepf, Secretary Robert E. Lee and Superintendent Newton Wickersham of the Cincinnati Traction Company have been indicted by the grand jury for "permitting a motor street car to remain without proper protection to the motorman." This action is on account of an accident on December 30, when 2 men were killed and 30 injured. J. H. Schoepf, claim agent, and William E. Blosing, foreman at the car barns, were also indicted for refusing to answer a subpoena of the grand jury, and for failing "to produce in court certain documents and paraphernalia of the traction company," the latter referring to parts of the wrecked car and books of the company which they were ordered to produce in court.

Iowa Street and Interurban Railway Association.

Secretary L. D. Mathes, of Dubuque, Ia., announces that the fourth annual convention of the Iowa Street and Interurban Railway Association will be held at the LaFayette Inn, Clinton, Ia., on April 19 and 20. The program is not yet complete for announcement in detail, but will include the following papers: "The Steam Motor Car—Its Value for Interurban Service," "Freight Handling by Electric Lines," "Amusements—How Should this Feature be Handled by the Operating Companies," "Modern Train Dispatching Methods for Electric Railways" and "Handling the Peak, or Rush Hour Traffic on City and Interurban Lines." Those who have attended former meetings of the association will recall that it is the practice of the association to thoroughly discuss the papers read. Ample exhibition space has been provided for representatives of the supply trade. Inquiries concerning hotel reservations and other matters in connection with the convention should be addressed to Mr. P. P. Crafts, general manager, Iowa & Illinois Railway Company, Clinton, Ia. The officers of the Iowa Street and Interurban Railway Association are as follows: President, F. J. Hanlon, Mason City, Ia.; vice-president, P. P. Crafts, Clinton, Ia.; secretary and treasurer, L. D. Mathes, Dubuque, Ia.

Bill to Tax New Hampshire Street Railways.—A bill has been introduced in the legislature providing for a tax of from one to three per cent, according to certain conditions, upon the gross receipts of all electric railways.

Indiana One-Cent Fare Bill Killed.—The bill introduced in the Indiana legislature by Representative Joyce of Vigo county to compel all the interurban roads in Indiana to make a flat rate of one cent a mile was rejected in the house by a vote of 62 to 27. At the suggestion of Representative Kelley, Mr. Joyce will introduce a new bill making the rate 1½ cents per mile.

Growth of the Railroad Y. M. C. A.—The railroad department of the International Committee of Young Men's Christian Associations, 3 West Twenty-ninth street, New York, has just issued its annual pamphlet called "Progress and Outlook," which shows the growth of the railroad department for the year 1906 and the prospects for the year 1907. The summary for 1906 shows that there are now 230 associations, a gain of 23 over the previous year, with a membership of 81,610, an increase of 10,286, and that the

associations own 162 buildings, an increase of 32, with a valuation of \$3,000,150, \$742,400 more than in 1905. The pamphlet contains several half-tone engravings of some of the association buildings.

Vacuum Cleaning System in Portland.—The Portland (Ore.) Railway Company has recently begun using the vacuum system for cleaning its cars. The apparatus, which consists of a rotary air suction pump, driven by a 5½-horsepower motor, capable of developing a vacuum of 21 to 25 inches, is installed in an old car, and may be taken from one car barn to another. From 30 to 40 cars a day may be cleaned in this way.

To Permit Cities to Acquire Street Railway Property.—It is stated that a bill similar to the Mueller law now in force in Illinois to permit cities to acquire street railway and other corporation property by issuing certificates secured by the property itself instead of bonding the other property in the city, will be introduced into the Minnesota legislature soon. The measure was recommended by the governor in his message.

Attack Against Overhead Trolley System in San Francisco.—It is reported that Ernest H. Wakeman, an attorney of San Francisco, will bring an action in the United States circuit court at San Francisco against the United Railroads Company, in order to have the overhead trolley system declared a nuisance, on the ground that it is a menace to human life. It is also declared that the franchise which permits the overhead wire is invalid.

North Alabama Traction Company to Build Amusement Park.—The North Alabama Traction Company of New Decatur, Ala., is planning the construction of an amusement park and though nothing definite has been done toward the selection of amusement devices Mr. W. R. Hall, general manager, anticipates having the park ready for business in the early summer. The company operates about 11 miles of city lines, serving a population of upwards of 16,000.

Half Fare for Passengers Without Seats.—A bill introduced into the Oregon legislature requiring street railway companies to issue a rebate ticket worth half the amount of the fare paid was defeated on January 30 because of a technicality, although it is stated that there was a strong sentiment in favor of it. According to the provisions of the bill the companies were not allowed to refuse transportation to passengers after the seats had all been occupied, unless another car was following not more than five minutes behind.

Additional Amusements for Olcott Beach Park.—A large tract of land adjoining the park of the International Railway Company at Olcott Beach has been leased to the Charles Amusement Company of Buffalo, N. Y. It is announced that Charles W. McMahon is president and Charles G. Stevens secretary and treasurer of the new company. It is the intention to install various devices for the diversion of pleasure seekers, from the figure eight and circle swing to the Ferris wheel, and the ground will be broken for the foundations as soon as the weather will permit.

Bill to Make Interurban Railways Common Carriers.—A bill has been introduced into the Texas legislature to regulate the powers and duties of electric interurban railways. An interurban electric railway is defined as one which operates wholly by electricity between two or more incorporated cities or towns in the state, and such railways are authorized to carry freight and express as well as passengers, as common carriers. They shall report to and be regulated by the Texas railway commission, except as regards rates, which shall be under the control of the legislature.

New York Franchise Taxes.—The total franchise tax levied against the street railway companies operating throughout Greater New York from the first levy of 1900 up to and including 1905 is officially reported at \$16,964,258. Cancellations by order of court amount to \$2,081,898, and partial payments have been made aggregating \$5,765,746, leaving a balance still outstanding of \$9,116,613. Interest to February 1 at 7 per cent on this sum, which is allowed by law, is \$2,366,275, making a total of \$11,482,888 which is claimed by the city. The Metropolitan Street Railway Company is charged with \$3,732,143 of this sum and the Brooklyn Rapid Transit Company with \$2,222,622.

Automobile Railway in Indiana.—Thomas J. Honan, of Jackson county, has introduced a bill into the Indiana legislature which gives the right of condemnation and other privileges accorded to steam and electric railroads to companies desiring to operate automobiles over a private right of way. The bill is said to be in the interest of Z. T. Sweeney, of Columbus, and others, who propose to operate an automobile line between Seymour and Brownstown over a concrete roadbed, with a high rail of concrete on each side to confine the wheels. One of the promoters has stated that they will run cars carrying from 30 to 50 people, and that the cost of construction will be about half that for an electric line.

Cleveland Traction Situation.—No announcement has yet been made as the result of the conferences between President Andrews of the Cleveland Electric Company and President Dupont of the Municipal company to determine the value of the old company's property. Both companies have large forces at work making appraisals independently. On Monday, February 4, Mr. Dupont and Mr. Davis reported to the city council that until the value of the physical property of the Central avenue-Quincy street route had been determined it would be impossible for them to determine the amount due the city from the company for the use of those streets since the expiration of the franchises. The Municipal Traction Company has adopted a novel plan for advertising and extending its three-cent fare system, by accepting the Cleveland

Electric 3½-cent tickets for transportation on its own cars without any arrangement with the Cleveland company for redeeming them. These tickets are then sold again to the conductors for further use at three cents each.

Indicating Signs for Express Trains in New York Subway.—The Interborough Rapid Transit Company, which operates the New York subway system, has adopted at Wall, Fulton and Grand Central stations a system of designating express trains that considerably relieves the confusion on these platforms. At every half car length along the platforms a small sign is suspended by wire from above and these indicate alternately the Broadway and the West Farms express. The trains are stopped so that the entrance doors are always opposite the proper sign.

New Headquarters for American Street and Interurban Railway Association.—Secretary B. V. Swenson announces that the headquarters of the American Street and Interurban Railway Association will be moved on Tuesday, February 12, from 60 Wall street to the Engineering Societies building, 29 West Thirty-ninth street, New York. This change in address is made in accordance with the plans of the executive committee, as announced at the Columbus convention. The association will have more commodious offices than heretofore and it is believed that the plan of having the headquarters of all the national engineering and allied societies in one building will work out most advantageously to the general interests and welfare of these associations.

The Electric Journal Topical Index.—The new topical index for the first three volumes of "The Electric Journal," published by The Electric Club, of Pittsburg, Pa., has just been issued. This paper has adopted the plan of issuing annually an index covering all of the preceding volumes, so that it is not necessary to look through a number of volumes to find a desired article, but any article in any volume, along with all articles on the same subject, may be quickly located. This seems especially useful in connection with a technical publication in which the contents are valuable for reference, as it is the experience of almost every engineer who has had occasion to refer to a technical periodical, that it is a very tedious task to find information from back numbers along any desired line, when there is a separate index for each volume.

Result of T-Rail Controversy in Columbus.—An official of the Indiana Columbus & Eastern Traction Company is authority for the statement that this company will probably make no permanent improvements in Columbus, O., in the way of either a passenger or freight station until the T-rail controversy is settled in a manner satisfactory to it. The company plans to put on heavier passenger cars with deep flanges that will admit of high rates of speed and these plans, he said, are effectually blocked by the position the city authorities have taken in demanding the laying of grooved rails in the city. The general offices of the passenger, freight and claim departments have taken leased quarters in the new First National Bank building and arrangements are being made to increase facilities for handling freight at the old interurban station.

Valuation of Milwaukee Electric Railways.—The physical valuation of the properties of the Milwaukee Electric Railway & Light Company, including both city and interurban mileage, is now being determined for the Wisconsin State Board of Assessment and the Railroad Commission of Wisconsin. The valuation staff has been drawn in part from the staff hitherto engaged in the valuation of steam roads in Wisconsin and in part from The Arnold Company of Chicago, which recently had charge of the valuation of the street railway properties of Chicago. Prof. W. D. Pence, M. Am. Soc. C. E., engineer for the two state commissions, has charge of the valuation and with him are associated Bion J. Arnold, M. Inst. C. E., president of The Arnold Company, consulting engineer; C. M. Larson, chief roadway inspector; Prof. John G. D. Mack, M. Am. Soc. M. E., chief mechanical inspector; and George Weston, chief electrical inspector.

Electrolysis Controversy in St. Paul.—It is announced that an agreement may be reached between the St. Paul water board and the St. Paul City Railway Company regarding the electrolysis of the water pipes. The railway company has taken exception to the report of the water board's expert, Prof. D. C. Jackson, on the ground that the additional improvements he suggests would cost \$100,000. Prof. Jackson states in his report that although the returns have been much improved, material damage will be caused to the water mains unless the returns are considerably increased. The railway company has asked the board to arrange a meeting between their engineers and Prof. Jackson to discuss a compromise plan. In case of failure on the part of the railway company to comply with any reasonable demands, the board will again institute the \$500,000 damage proceedings which were brought against the railway company to cover the damage caused to the piping system.

May Use Wooden Cars in Bridge Loop Subway.—The plan and scope committee of the New York rapid transit commission at a meeting on February 5 decided to allow the Brooklyn Rapid Transit Company to use rolling stock that need not be fireproof in the proposed new subway loop to connect the Williamsburg and Manhattan bridges. President Winter of the Brooklyn Rapid Transit appeared before the committee and said that he was not prepared to give assurances in behalf of his company that it would change its rolling stock to fireproof cars to be assured of use of the subway loop. Mr. Winter explained that his company was constantly getting rid of its inferior cars and replacing them with modern steel and wood cars of a substantial type. After a thorough discussion it was decided to report a resolution to the full board on

Thursday, February 7, allowing the Brooklyn Rapid Transit Company to use rolling stock in the subway loop such as it is using on its elevated lines, provided that the cars shall be at least as good as the most modern cars recently purchased by the company.

Report on Electrification of Erie Railroad.—It is announced that the commission appointed over a year ago to investigate the subject of the electrification of the Erie's suburban lines in New Jersey, will make its report to the board of directors in a few days. The committee is composed of Vice-President J. M. Graham, L. B. Stillwell and B. J. Arnold. The New Jersey suburban territory now being considered in this connection includes the New Jersey & New York division for 33 miles; the Northern Railroad of New Jersey, 29 miles, to Nyack; the Greenwood Lake division, including the Morristown branch, 33 miles on the main branch, 14 miles on the Morristown branch, and 4 miles on the Orange branch. The main line is to be electrified as far as Tuxedo, 39 miles; the Newark branch, from Jersey City to Paterson, 19 miles, and the New York Susquehanna & Western for 39 miles. Westinghouse, Church, Kerr & Co. are now engaged in electrifying the main line of the Erie from Rochester to Avon, N. Y., and the branch from Avon to Mt. Morris, 34 miles in all. A trial trip was made recently between Rochester and Avon, 19 miles, and the line is expected to be in regular operation some time this month. Single-phase alternating current is used at a pressure of 11,000 volts. Power is received from Niagara Falls.

Bill to Promote Electric Railway Building.—The building of trolley lines in Minnesota is likely to receive a new impetus, if a bill introduced into the lower house of the legislature by N. F. Hugo of Duluth becomes a law. The bill is intended to facilitate the building of electric railways in country districts by offering the privilege of freight transportation, and its provisions include the general regulation of lines running from cities and towns into surrounding country territory. According to the bill any electric railway company already organized or hereafter to be organized is empowered to construct, operate and maintain lines in territory outside of the corporate limits of cities and towns, and along country roads or through private property, and to carry both passengers and freight for compensation, to condemn property for that purpose, and, furthermore, with the consent of city or town authorities, to connect its lines with central stations in cities or towns for the receipt of passenger freight. While the bill is general in its scope, it was framed especially to cover a need at Duluth. Several of the residents of the country districts outside of the city have offered to the Duluth Street Railway company to build a line such as they want if the company will maintain and operate it. The company is unwilling to agree to the plan unless it can have the privilege of carrying freight, which is now contrary to law.

Settling Claims Against Street Railway Corporations in New York.—The New York City Railway Company last week tendered Comptroller Metz \$150,000 in part payment of the city's claim of \$403,790 on account of deferred car license fees, with the understanding that the payment is not to prejudice the company's allegation that the city's claim is excessive. The case has been in the courts for some time and several administrations have tried to collect the fees. The contention of the company is that the city is trying to collect for both summer and winter cars, and that this is essentially unjust, as about half the company's cars are housed at varying seasons. The company is unwilling to pay more than for the number of cars actually in use the year round. Mr. Rives, former corporation counsel, contended that the law bound the company to pay on every car for which a license was issued.—Attorneys representing the company have also called upon Corporation Counsel Ellison to discuss arrangements for a settlement of the city's claims for repaving between the company's tracks. The claims cover a period of about ten years and amount to \$1,512,000. When Mr. Rives was corporation counsel he brought suit to recover the amount and a referee was appointed but never gave a decision. The company contends that since the introduction of electricity as motive power it should not be obliged to pay for repaving and that the case is not the same as in the days of horse-cars, when the horses wore out the pavement.

American Association Committee for 1907.—Since the issue of the Electric Railway Review of February 2, the membership of two additional committees for the work of the 1907 convention of the American Street and Interurban Railway Association has been completed as follows:

Standard Code of Rules.

E. G. Connette, chairman, general manager Worcester Consolidated Railway Company, Worcester, Mass.

E. C. Faber, general manager Aurora Elgin & Chicago Electric Railroad, Wheaton, Ill.

E. J. Lyon, superintendent Schenectady Railway Company, Schenectady, N. Y.

F. J. Stout, general manager Lake Shore Electric Railway Company, Cleveland, O.

J. N. Shaughnessy, general manager Fonda Johnstown & Glensville Railroad Company, Glensville, N. Y.

Standardization.

H. C. Page, chairman, general manager Springfield Street Railway Company, Springfield, Mass.

T. W. Wilson, general manager International Railway Company, Buffalo, N. Y.

John Murphy, general superintendent Pittsburg Railways Company, Pittsburg, Pa.

H. A. Nicholl, general manager Indiana Union Traction Company, Anderson, Ind.

H. Wallerstedt, electrical engineer, Ford, Bacon & Davis, New York city.

Construction News

INCORPORATIONS.

Black River Electric Power Lighting & Railway Company.—Incorporated in New Hampshire to build a lighting and power plant and to build an electric railway from Claremont, N. H., to Ludlow, Vt. Capital stock \$1,000,000. Incorporators: John B. Reynolds, New York, president; J. E. Jones, Boston, treasurer; Fred C. Davis, of Springfield, Mass., superintendent.

Dallas Interurban Electric Railway.—Incorporated in Texas to build and operate an electric line from Dallas to other points in Texas under a franchise granted to J. Mercer Carter and associates last September. It is stated that plans for the local and interurban service already have been prepared by the American Engineering Company and that construction is to begin within six months from date of the franchise. It is also agreed that there shall be 20 miles of interurban railway entering the city within one year from the beginning of construction. Capital stock, \$2,400,000, of which \$1,800,000 is common and \$600,000 preferred stock. Bonds are to be issued on a basis of \$30,000 for each mile of railway. Incorporators: D. D. Waggoner, president; J. J. Willingham, first vice-president; J. Mercer Carter, second vice-president; Charles T. Alexander, third vice-president; Sidney A. Stermons, secretary; M. H. Wolfe, treasurer; W. H. Clark and W. T. Henry, attorneys; Alexander Sanger, E. M. Kahn, C. C. Slaughter, Robert Ralston, Edward Titche, R. C. Buckner, O. H. Lang, J. B. Nabors and D. Sonnentheil, all of Dallas.

Enid City Railway.—Incorporated in Oklahoma to build a street railway in Enid. Capital stock, \$500,000. Incorporators: John Hall, Albert E. Manuel and Charles Bosler, of Dayton, O.; Carl Kruse and W. H. Hills, of Enid.

Greenville & Greenwood Railway.—Incorporated in South Carolina to build from Greenville to Greenwood. Capital stock \$100,000. Incorporators: H. H. Prince, president; S. A. Anderson, of Marietta, Ga., vice-president; F. C. Owens, Atlanta, Ga., treasurer, and T. J. Connors, secretary.

Hornell Bath & Lake Keuka Railway.—Incorporated in New York to build an electric railway 46 miles long from Hornell, Steuben county, to Jerusalem, Yates county. Capital stock, \$1,000,000. Incorporators: F. W. Hastings, W. R. Campbell and W. H. Phillips, of Bath, N. Y.

Ithaca & Seneca Falls Electric Railway.—Incorporated in New York on February 4 to operate an electric road 50½ miles long from Ithaca to Seneca Falls, with branches from Willard to Ovid and from Trumansburg to Mecklenburg. The capital stock is \$1,000,000 and directors named are J. N. Hammond and T. J. Cleary of Seneca Falls and Jacob Rothschild of Ithaca.

La Crosse & Winona Traction Company.—Incorporated in Minnesota to build and operate an electric line from La Crosse, Wis., to Winona, Minn. This is a subsidiary company of the La Crosse Water Power Company, which is developing water power from the Black River at Hatfield, Wis. Capital stock, \$50,000. Incorporators: C. M. Morse, president; C. P. Crandall, vice-president; F. H. Sampson, secretary, and C. M. Green, treasurer, all of Winona. E. Boynton of La Crosse, is one of the directors.

Manitou & Crystal Park Railway.—Incorporated in Colorado to build an electric line from Manitou to Crystal Park. It is stated that the company is planning a scenic railway on a large scale with a line from Crystal Lake through the mountains to Cheyenne canon. It is announced that the road from Manitou to Crystal Park will be completed and in operation by next summer. Capital stock, \$1,300,000. Incorporators, J. K. Vanatta and C. W. Dolph, Colorado Springs, and E. A. Sawyer, engineer.

Manitou & Interurban Railway.—Incorporated in Colorado to build an interurban line from Manitou to points in Colorado. Capital stock, \$300,000. Incorporators, J. K. Vanatta, C. W. Dolph and E. A. Sawyer, Colorado Springs.

Minster Lorain & Southern Railway.—Incorporated in Ohio to build an electric railway from Minster, Auglaize county, to Versailles, Darke county, 18 miles. Capital stock, \$10,000. Incorporators: J. H. Goeke, William Schulenberg, F. M. Horn, R. J. Defenbrock and P. B. Henderson. Headquarters, Wapakoneta, O.

Mississippi Valley Electric Railway.—Incorporated in Illinois with a capital stock of \$2,500. Incorporators: Howard T. Wilcomin, Arthur W. V. Eastburn and Charles W. Lucas.

People's Railway.—Incorporated in Pennsylvania to build 2 miles of electric railway in the borough of Ellwood City, Lawrence county, Pa. Capital stock, \$12,000. Incorporators, James Campbell and Frank Sheridan, Ingram; Gomer L. Jenkins, Pittsburg; Frank S. Christy, Crafton, Pa.

Prosser Traction Company.—Incorporated in Washington to build a line westward from Prosser 10 miles and one eastward 35 miles. Capital stock, \$150,000. Incorporators, Frederick Finn, president, F. A. Jenne chief engineer; J. W. Callicotte, G. A. Todd and George E. Boomer, Prosser, Wash.

Redlands & Yucaipe Electric Railroad.—Incorporated in California to build an electric line from Redlands to Oak Glen in the Yucaipe valley, 18 miles; also to manufacture gas, electricity and ice. The road will traverse the principal streets of Redlands and from the city limits will run to Oak Glen in the mountains. It is stated that the company intends to develop the country around

Oak Glen and eventually make of it a large summer resort. Capital stock, \$1,000,000, of which \$15,000 has been subscribed. Incorporators: C. S. Chesnut, G. H. Dunn, O. D. Miller and A. A. Moore.

Wawasee Ligonier Topeka & Lagrange Railway.—Incorporated in Indiana to build an interurban line from Lagrange to Wawasee, Ind., through Kimmell, Cromwell, Topeka and Ligonier, Ind., with headquarters at Ligonier. The company will also furnish light and power for commercial purposes along its route. Capital stock, \$50,000. Incorporators: F. H. Green, Frank P. Bothwell and F. E. Weir, Ligonier; Sumner Dowell, I. J. Vaughn and J. N. Babcock, Topeka, and A. J. Hostetter, B. B. Johnston and F. J. Dunten, Lagrange, Ind.

Wilmington & Wittingham Traction Company.—Incorporated in Massachusetts with a capital stock of \$50,000 to build an electric line from the Massachusetts state line at Halifax, Vt., north through Halifax, Wittingham and Wilmington. It is stated that this project is the outgrowth of the purchase of the controlling interest in the Shelburne Falls & Colerain Street Railway Company by a syndicate in which Martin A. Brown, of Wilmington, is interested. It is said the plan is to extend the present line to the railroad station at Shelburne Falls and later north to Wilmington.

FRANCHISES.

Albia, Ia.—A franchise has been given the Albia Electric Light & Power Company for a street railway in this city. It is stated that the owners of the Albia system also control the building and operating of the interurban line from Oskaloosa to Buxton which is believed to indicate that it will be extended to Albia. It is announced that work will be started on the line in the spring.

Cherryvale, Kan.—The Union Traction Company has accepted the franchise recently granted by the council. This provides that \$1,000 shall be deposited by the company as a guarantee that the road will be built according to the terms of the franchise, one of which is that it shall be finished within 16 months after acceptance. The company has also asked for a franchise in Parsons.

Demopolis, Ala.—A franchise has been granted to F. M. Abbott for the Demopolis & Linden Railroad, which proposes to build a street railway in Demopolis and a line to Linden, Ala.

Green River, Utah.—A franchise has been granted to Merritt & Cook for an electric line from the city to the dam on Green river, 7 miles long, with the privilege of furnishing power for lighting the city.

Hammond, Ind.—The Gary Hammond & Eastern Interurban Railway has applied for a 50-year franchise to operate over certain streets of Hammond. William Walmsley, formerly of the South Chicago Street Railway Company, made the application.

Joliet, Ill.—The city council has reconsidered the ordinance recently passed granting the Chicago & Joliet Electric Railway Company a 20-year franchise for laying tracks on Western avenue and has amended it to read "until 1920" instead, so as to make it co-existent with other grants. It is stated that the company intends to ask for the privilege to lay a double track on Chicago street as far as Fifth avenue and on Fifth avenue to Sherman street; also from Chicago street east on Jefferson to Eastern avenue and south to Second avenue.

Marion, Ind.—The Grant, Miami, Cass & Western Traction Company will ask for a franchise at the next meeting of the county commissioners. The line will run from Marion to Logansport and will touch 12 towns along the route. It is said that a 5-cent fare between stations will be charged, with \$1 for the round trip between Marion and Logansport.

Marlin, Tex.—The Buckeye Transit Company has made application for a 50-year franchise for an electric line in this city. This is the company which is to build an interurban line from Marlin to Temple by way of Mooresville and Waco. Work is to be begun within two years from the date of the franchise.

Owatonna, Minn.—The Twin City Rochester & Dubuque Electric Railway, which proposes to build an electric line from Minneapolis and St. Paul to Dubuque, Minn., has applied for a franchise.

Peru, Ind.—The Marion & Logansport Interurban Company has made application for a franchise through Jackson, Harrison, Clay and Pipe Creek townships. It is said that the company already has secured right of way paralleling the Pennsylvania road and that grading will be begun within a few months. The line will pass through Sweetzer, Mier, Converse, Amboy, McGrawsville, Loree, Bunker Hill, Onward, Anoka, Ind., with terminals at Marion and Logansport.

San Angelo, Tex.—Col. J. H. Ransom, Boulder, Colo., has asked for a franchise to build a street railway. He agrees to build one mile the first year, three the second and four the third. He also asks that the property be forever exempt from taxation, agreeing to pay, after the fifth year, $\frac{1}{4}$ of 1 per cent of the gross earnings of the system to the city.

Sandusky, O.—The Sandusky Fremont & Southern Railway has been granted a 25-year franchise across Depot and Norwalk streets in Castalia. The company has agreed to pay for a 24-inch cement tile under the bed of the stream for drainage purposes. It is stated that the crossing with the Pennsylvania road will be accomplished by either an under or overhead grade-crossing part of the expense of which will be borne by the latter company.

Tecumseh, Mich.—A franchise has been granted to the Adrian

Ann Arbor & Detroit Electric Railway, which proposes to build an electric railway connecting the towns named in the title.

TRACK AND ROADWAY.

Addison & Woodhull Electric Railroad.—A meeting has been called to discuss plans and secure stock subscriptions for the construction of this road, which is proposed to connect Addison and Woodhull, N. Y., via Jasper.

Amarillo Street Railway.—This company is letting contracts and making preparations to begin work on the street railway line in Amarillo, Tex. By the terms of the franchise work must be started by April 11 and at least three miles must be in operation by November 11. H. A. Nobles, Amarillo, president.

Boston, Mass.—The Massachusetts railroad commissioners recently held a hearing to consider granting a certificate of necessity to two companies which propose to build electric railways between Boston & Providence. One is the Boston & Providence Interurban Electric Railroad, backed by the Stone & Webster Engineering Corporation and the Gaston-Shaw interests, of Boston, which expects to build a high-speed interurban line on a private right of way. The other is the Boston & New York Electric Railroad, in which A. B. Leach and O. B. Clancy and others, of Boston, are interested. This company intends to build its road through the streets of the towns and cities or on the highways rather than on a private right of way. The hearing was postponed until February 11, at which time both companies are to give further details as to the routes.

Central California Traction Company.—One of the officials of this company has announced that it is expected to have the line between Stockton and Lodi in operation by April 1. The rails and ties are on the ground, and the contractor for the grading and trestle work is making preparations to begin work as soon as the weather permits. E. P. Hilborn, general manager, Stockton, Cal.

Central Interurban Traction Company.—Charles A. Gutke, president, 1113 Chemical building, St. Louis, writes that it is expected to begin grading on June 1, on 24 street railway lines in St. Louis, to connect with the Hillsboro Kimmswick & Southern Railway, which will build from the city limits to the Flat River.

Chicago South Bend & Northern Indiana Railway.—Samuel T. Murdock, of Lafayette, Ind., general manager of this company, which has been incorporated to take over the Northern Indiana Railway and build extensions, is quoted as saying that work is to begin at once on a line from South Bend to Michigan City, Ind., 28 miles, with construction material already obtained by the Northern Indiana. Mr. Murdock states that this line should be completed by January 1, 1908, and that another extension, from Michigan City to Chicago, about 35 miles, will be completed in about two years.

Cleveland Alliance & Mahoning Valley Railway.—It is reported that James W. Holcomb, of Cleveland, the promoter of this road to connect Cleveland with Ravenna, Alliance and Warren, O., has effected an agreement with the Everett-Moore interests in the Northern Ohio Traction & Light Company whereby they will join in the construction of the road, making use of the Northern Ohio tracks for part of the distance. It is also stated that a new company will be organized at once to build the first section of the road, from Ravenna to Warren, electrifying the road between Ravenna and Newton Falls which has been leased from the Baltimore & Ohio.

Columbus Marion & Bucyrus Railroad.—George Whysall, general manager, Marion, O., writes that this company which is building an extension of the Columbus Delaware & Marion Railway from Marion to Bucyrus, O., is now clearing the right of way in order to be ready to begin grading as soon as the weather is suitable. Some of the grading has been done and in the spring the work will be rushed to completion, in the endeavor to have the road in operation by June 1.

Dillonvale & Ohio River Traction Company.—At a recent meeting of the directors it was decided to begin work this month on the road from Rayland to Dillonvale, O., $6\frac{1}{2}$ miles. Most of the right of way has been obtained. T. J. Stringer has the contract.

Eastern Iowa Traction Company.—This company is making surveys for an electric railway between Dubuque and Davenport, Ia., and the complete plans include further extensions south through Burlington, Keokuk and Hannibal to St. Louis and north to Minneapolis and St. Paul. Mrs. Alice M. Butler, of Davenport, is one of the promoters.

Frankfort Delphi & Northern Traction Company.—W. H. Cohee, vice-president and general manager, Frankfort, Ind., writes that this company proposes to build an electric railway from Frankfort, Ind., to Chicago, via Delphi, Monticello, Monon and Hammond, connecting at Frankfort with the Indianapolis & Northwestern Traction Company. The section of the road under consideration for immediate construction is that from Frankfort to Delphi, Ind., 27 miles, via Rossville, Endner Mills and Plymouth. A right of way 50 feet wide has been secured except in towns. At Pymont, on the Wild Cat river, it is expected to build a dam and develop a water power capable of generating 1,500 horsepower. A. S. Straus, 233 Franklin street, Chicago, president; James R. Brown, Frankfort, Ind., chief engineer.

Houston Electric Company.—This company has begun the work of reconstruction of several of its lines in Houston, Tex. The track of the San Felipe line is being relaid and a portion of the

Heights Boulevard line has been relaid. David Daly, manager, Houston, Tex.

Illinois Traction Company.—The track is now laid on the Bloomington-Peoria line from Bloomington to East Peoria, although all of the poles and wires have not yet been put up. Cars were operated over the Champaign-Decatur line from Champaign to Seymour on Saturday, February 2.

Indiana Columbus & Eastern Traction Company.—Superintendent A. F. Schoepf, of the Columbus and Springfield division, has been authorized to commence work on the construction of the London cutoff early in the spring. This will shorten the main line between Columbus and Springfield about seven miles, and as the London stop will also be eliminated it will shorten the running time of the Columbus-Springfield limited cars almost 30 minutes. The cutoff extends from Lafayette to Summerford in Madison county, O., a distance of five miles. The present line extends south, from Lafayette on the east and Summerford on the west, in order to take in London, the county seat of Madison county, and the distance by that route is 12 miles. Vice-President Norman McD. Crawford, General Manager J. L. Adams and Superintendent Schoepf walked over the cutoff right of way last week and decided upon various details of the construction. This will be an expensive piece of work, as several heavy fills will be necessary and three steel bridges will have to be built. The longest of the bridges will be 153 feet, crossing Deer creek. The other bridges will be about 40 feet each. Each will have concrete piers.—The company is now doing the preparatory work on the line between Lima and Defiance, O., in order to be able to rush the construction in the spring. The Columbus & Lake Michigan steam road, which covers a part of the distance, is to be electrified. The company has purchased 15,000 ties and is distributing them along the right of way.

Knoxville Railway & Light Company.—The work of double-tracking the Main street line in Knoxville, Tenn., from Prince street to Temple avenue, has just been completed. As soon as the weather will permit the company will begin double tracking the Broadway line from Fifth avenue to First Creek.

Leroy & Southwestern Railroad.—A. H. Shelby, of Wapello, Ill., president, writes that contracts are to be let for construction and equipment of this line from Leroy to Waynesville, Ill., 23 miles, via Southdowns, Solomon, Wapella and Scott. It is proposed to operate the line with some form of gasoline-electric motor cars, of a sufficient power capacity to haul trains of 15 or 20 freight cars, as the line will be built principally for freight. Two passenger cars, a combination baggage and mail car, and about 50 freight cars will be required. The company is now considering a proposition to finance, construct and equip the line, but is willing to entertain separate proposals, for financing, and construction and equipment.

Lynchburg Traction & Light Company.—It is stated that this company is considering plans for an extension of this line from Lynchburg, Va., to a connection with the Tidewater Railway at Clayton's Ford bridge, 22 miles.

Mesaba Traction Company.—The Duluth Surveying Company is making surveys for this line, which is to connect Blwabik and Hibbing and other towns on the Mesaba range, Minnesota. F. B. Meyers, of Blwabik, is president.

Milwaukee & Fox River Valley Railway.—The final survey for this company's proposed line from Fond du Lac to Chilton, Wis., has been started. The preliminary surveys were made some time ago and it is stated that the right of way has been secured. J. M. Saemann, of Sheboygan, Wis., president.

Northern Texas Traction Company.—M. M. Phinney, of Dallas, Tex., general manager, states that the preliminary work on the proposed lines in Texas is progressing rapidly. The lines are: from Galveston to Houston; from Dallas to Ennis, via Waxahatche, and from Ft. Worth to Cleburne.

Omaha & Council Bluffs Street Railway.—The directors decided last week to begin construction in the spring on three city lines in Omaha, on Twenty-fourth street, on Fortleth street, and on L street.

Pacific Traction Company.—Work has been resumed on the grading of this company's line from Tacoma to American Lake, Wash. It is estimated that about 19,000 cubic yards of excavation will be required. B. J. Weeks, of Tacoma, general manager.

Plainfield & Sterling Railway.—H. H. Gallup and others have applied to the Connecticut legislature for a charter for this company. They propose to build an electric railway from Moosup to Sterling, Conn.

Putnam & Westchester Traction Company.—This company, which proposes to build an electric railway from Peekskill to Oregon, N. Y., 4 miles, has been granted a certificate of necessity by the New York Railroad Commission. J. S. Ladd, of Peekskill, N. Y., is president.

Red Lion & Alrville Traction Company.—This company has been organized and will be financed by A. K. Frey, Samuel Fulton, Hugh Ross and others, of York county, Pa., to build an electric railway from Yoe to Delta, in York county, via Alrville. Power will be received from a plant at McCall's Ferry.

Richmond & Chesapeake Bay Railway.—We are officially advised that the road from Richmond to Ashland, Va., is nearing completion and that a preliminary survey has been made for an extension from Ashland to Tappahannock, Va., 42 miles. F. J. Gould, president, New York, J. H. M. Lure, chief engineer, Richmond, Va.

Rome, Ga.—The Merchants' and Manufacturers' Association, of this city is considering a proposition made by Ben Watts and others to build an electric railway nearly 50 miles long in a circuit including Rome, Cedartown, Cave Springs, Lindale, Etna and other towns.

Salem, O.—It is reported that Pittsburg capitalists, represented by S. L. Tone of the Pittsburg Railways Company, are planning to build an electric interurban line from Alliance to Salem and Youngstown, O., and that City Engineer B. M. French, of Salem, has been engaged to make the survey.

Seashore Municipal Railroad.—H. D. Bristol, secretary, of Oceanside, N. Y., writes that this company, recently incorporated to build from Hempstead to Long Beach, L. I., has made all its surveys and secured all the necessary franchises for its line and is ready to let contracts. Paul K. Ames, of Rockville Center, L. I., president; Henry Olmstead, Jr., of Freeport, L. I., chief engineer.

Shore Line Electric Railway.—It is stated that this company will make application to the Connecticut legislature for permission to build an extension about six miles long from Essex to Chester through Deep River. A. William Sperry, secretary and treasurer.

Spokane & Inland Railway.—It is stated that by April 1 this road will be so far completed that trains may be run from Spokane to Garfield, Wash. The line is now in operation as far as Rosalia. Between Garfield and Palouse the track is being laid to close up the few remaining gaps. Grading is in progress between Palouse, Wash., and Moscow, Idaho. A. M. Lupfer, chief engineer, Spokane.

Texas Traction Company.—The contract for the culvert work on this line from Dallas to Sherman, Tex., has been let to the Atlas Metal Works, of Sherman. Two grading crews are now at work and another is soon to be added, between Dallas and McKinney. J. F. Strickland, Dallas, president.

Troy Rensselaer & Pittsfield Street Railway.—A corps of engineers is making preliminary surveys for an electric railway between Troy and Pittsfield, N. Y.

Vincennes Washington & Eastern Traction Company.—It is reported that financial arrangements have been completed for building this line from Vincennes to Loogootee, Ind., passing through Washington, about 40 miles, and that construction will begin in about two or three months, or as soon as the right of way is secured. The power house and shops are to be located at Washington. W. H. Schott, of Chicago, is president.

Watertown, N. Y.—It is reported that Watertown citizens are about to organize a company to build an electric railway from Watertown to Oswego, N. Y., and that arrangements have been made with Anson R. Flower, a New York banker, to finance the project.

POWER HOUSES AND SUBSTATIONS.

Brooklyn Rapid Transit Company.—A new substation will be erected at Flatbush avenue and Malborn street, at a cost of \$40,000. Three new substations are also under construction at Dean and Grand streets, East New York, and Corona.

Chicago South Bend & Northern Indiana Railway.—It is stated that the first work of this company, incorporated a few days ago to take over the Northern Indiana Railway and to build to South Bend, Michigan City and Chicago, will be to construct a large power house at South Bend. S. T. Murdock, Lafayette, Ind., general manager.

Huntsville (Ala.) Railway Light & Power Company.—This company is considering the adoption of natural gas for fuel in its power plant. The company has recently brought in two high-pressure gas wells on its property located a short distance from Huntsville and is now sinking several other holes with prospects of obtaining equally as valuable wells. A pipe line is being laid to the city with a view to furnishing gas for illuminating and heating purposes. If the supply proves as extensive as the tests indicate the use of coal as fuel at the power plant will be abandoned and gas will be used under the boilers for the generation of steam.

Nashville & Chattanooga Electric Railway.—Charles H. Fisk, of Detroit, Mich., one of the promoters, states that work is to begin at a very early date on the power plant which is to be built at the Great Falls on the Cunev Fork river. The company proposes to build an electric railway from Nashville to Chattanooga, Tenn.

Norfolk & Portsmouth Traction Company.—This new power house at Brambleton, Va., will not be entirely completed until some time this summer, although the three engines to be installed are to be in operation by March 15, according to a statement by General Manager E. C. Hathaway, of Norfolk. The new plant will supply power for lighting and other purposes for the Jamestown Exposition as well as for the railway, and will have a capacity of about 15,000 horsepower.

Sheffield Company.—This company is enlarging its power plant by the installation of a 1,250-kilowatt Westinghouse-Parsons turbine and a 300-horsepower Wickes vertical boiler. The former generating units of this plant consisted of a 325-kilowatt direct-current generator, a 250-kilowatt alternating-current generator and a 200-kilowatt rotary converter. In addition to supplying current for the operation of the railway between Tusculum, Sheffield and Florence, Ala., the plant furnishes current for lighting and power purposes in the three cities named. The plant is located on the banks of the Tennessee river at Sheffield, Ala.

Personal Mention

Mr. D. A. Swan has resigned as cashier of the Utah Light & Railway Company and will open an office in Salt Lake City as public accountant and auditor.

Mr. B. Brown on February 3 assumed the duties of assistant superintendent of transportation of the West Penn Railways, with headquarters at Connellsville, Pa.

Mr. Arthur C. Murray has resigned as purchasing agent of the Indiana Union Traction Company of Anderson, Ind., to become assistant general manager of the Illinois Traction Company, with headquarters at Springfield, Ill.

Mr. Thomas F. Delaney has been appointed foreman of the East New York elevated shops of the Brooklyn Rapid Transit Company, succeeding Mr. Ferris A. Overfield, resigned to engage in the general machinery business.

Mr. George S. Gannett has been appointed treasurer of the Utah Light & Railway Company, succeeding Mr. L. S. Hills, resigned. Mr. Gannett will also assume the duties of cashier, this office having been abolished with the resignation of Mr. D. A. Swan.

Mr. William Schwertfager has been appointed superintendent of the Dunkirk lines of the Buffalo & Lake Erie Traction Company, succeeding Mr. W. N. Mariman, resigned. Mr. Schwertfager has been superintendent of the Dunkirk & Fredonia Railroad, at Fredonia, N. Y.

Mr. John B. McDonald, of whom a biographical sketch and portrait appeared in last week's issue of the Review, was elected vice-president of the Interborough-Metropolitan Company, instead of the Interborough Rapid Transit Company, as stated. The Interborough-Metropolitan controls the Interborough Rapid Transit Company and the Metropolitan Street Railway Company.

Major E. S. Winters has been appointed general agent for the Atlanta Macon & Griffin and the Macon Americus & Albany Electric Railway companies, with headquarters at Macon, Ga. Major Winters was identified with the street railway systems of Macon from 1887 to 1903, when he became connected with the Montgomery (Ala.) Traction Company, later serving as receiver for the company until the final consolidation of the Montgomery lines. His present appointment will take effect at once.

Mr. C. L. Wilcoxon, general superintendent of the Western Ohio Railway Company, with headquarters at Wapakoneta, O., has resigned to accept a similar position with the Pittsburg & Butler Street Railway Company, with headquarters at Butler, Pa. Mr. Wilcoxon has been connected with the Western Ohio for about six years and has held his present position for about a year, having succeeded his father, Mr. C. N. Wilcoxon, now general manager of the Cleveland & Southwestern Traction Company.

Mr. E. C. Folsom has resigned his position with the Atlantic City & Suburban Traction Company, of Pleasantville, N. J., and the Walkill Transit Company, of Atlantic City, N. J., to become general manager of the Saginaw-Bay City Railway & Light Company with headquarters at Saginaw, Mich. In addition to his street railway duties he will also have charge of the electric light and power plants of both cities. Mr. Folsom was formerly general manager of the Ft. Wayne & Wabash Valley Traction Company.

Chicago-New York Electric Air Line Railroad.

President J. D. Price, of the Co-operative Construction Company, on February 2 drove the first spike at La Porte, Ind., and work is said to be in progress on a spur 3 miles long from La Porte to the main line. The driving of the first spike was attended by elaborate ceremonies. A shipment of rails and other materials has arrived and it is stated that a contract for two bridges has been let to the Modern Steel Construction Company, of Waukegan, Ill. The promoters claim that work will now proceed rapidly on the line between Chicago to Goshen, the first section of the widely advertised ten-hour ten-dollar air line from Chicago to New York.

Open Cut Method for Pennsylvania Tunnels.

Eugene A. Philbin, of the United Engineering & Contracting Company and the Pennsylvania Railroad, on January 31 asked permission of the New York rapid transit commission to excavate the tunnels under Thirty-second and Thirty-third streets between Madison and Seventh avenues, by the method of open cuts instead of tunneling by pneumatic shields. He said the contractor had discovered that the streets at the points stated were underlaid with quicksand and subterranean streams, making it impossible to bore the tunnels by the shield method, and making it necessary to cut the ground from the top. He said that it was desired to cut to a depth of 60 feet and that the entire width of the street from curb to curb would be required. The work would require about ten months to complete but that the streets would be covered over except between 11 p. m. and 7 a. m. Mr. Philbin presented affidavits from several prominent engineers to the effect that to continue with the present methods of excavation would seriously endanger the foundations of the buildings. The application was referred to Chief Engineer Rice, of the commission, for a report.

Financial News

Alton Granite City & St. Louis Traction Company.—The Edwardsville Alton & St. Louis Railroad has been acquired.

Ashtabula (O.) Rapid Transit Company.—It is reported that a controlling interest in the Pennsylvania & Ohio Railway, capitalists representing the Pennsylvania & Ohio Railway.

Bangor (Me.) Railway & Electric Company.—The capital stock will be increased from \$1,250,000 to \$1,500,000.

Brooklyn Rapid Transit.—At the annual meeting on January 25 the stockholders re-elected as directors for three years J. E. Jenkins, D. H. Valentine, H. C. Du Val and Eugene N. Foss.

Buffalo & Lake Erie Traction Company.—It is reported that the Erie Rapid Transit Street Railway Company and the Hamburg Railway will be absorbed.

Capital Traction Company.—The total passenger receipts in the District of Columbia and the Maryland division in 1906 were \$1,704,221.82. The receipts and disbursements are reported as follows: Receipts—from passengers, District of Columbia, \$1,680,184.78; from passengers, Maryland division, \$24,037.04; total, \$1,704,221.82. Freight, \$1,338; mail, \$2,903.28; rent of land and buildings, \$7,927.26; advertising, \$9,000; miscellaneous income, \$4.29; income from securities owned by insurance reserve, \$4,280; sale of tickets, \$1,659.18; bills payable, \$405,000; balance January 1, 1906, \$32,670.31. Total receipts, \$2,169,004.14. Disbursements—Maintenance of way and structures—Track and roadway, \$26,019.75; electric lines, \$7,840.72; buildings and fixtures, \$1,978.79; total, \$35,839.06. Maintenance of equipment—Steam plant, \$11,873.68; electric plant, \$1,980.80; cars, \$49,486.89; electric equipment of cars, \$25,661.05; horse and vehicle equipment, \$114.25; miscellaneous equipment, \$402.23; miscellaneous shop equipment, \$3,821.41; total, \$93,340.31. Transportation—Operation of power plants, \$90,501.60. Operation of cars—Superintendents of transportation, \$15,310.68; wages, conductors and motormen, \$305,263.49; freight and mail employees, \$1,186.35; other car service employees, \$15,846.92; car house employees, \$17,311.13; car and motor supplies, \$2,564.61; miscellaneous transportation expenses, \$13,948.27; cleaning and sanding of tracks, \$2,332.98; removing snow and ice, \$504.26; total, \$372,268.69. General expenses, \$122,571.74; taxes, \$76,343.89; special police, \$10,449; interest, \$43,200; construction and equipment, \$66,234.20; miscellaneous reserve, \$4,227.50; dividends, \$720,000; extension account, \$497,618.79; total, \$2,132,594.58; balance December 31, 1906, \$36,409.56; grand total, \$2,169,004.14. The report shows that during the year 39,649,442 revenue passengers were carried, and 14,498,560 transfer passengers, a total of 54,148,002 passengers.

Chicago & Oak Park Elevated Railroad.—The annual report of the Chicago & Oak Park Elevated Railroad for the year ended June 30 last, which has just been made public, shows a small increase in both gross and net earnings. The income account compares as follows:

	1906.	1905.	Increase.
Passenger earnings	\$863,637	\$821,196	\$42,441

*Decrease.

Consolidated Railway.—Judge Rugg, of the Massachusetts supreme court, after hearing arguments, has taken under consideration the action started by Attorney General Malone against the Worcester & Webster and the Webster & Dudley Street Railway companies to dissolve the corporations. The attorney general seeks to defeat the merger and the control by a foreign corporation. The Worcester & Webster company is leased to the Webster & Dudley company, which is said to be controlled by the New York New Haven & Hartford Railroad.

Detroit Jackson & Chicago Railway.—This company, which was recently incorporated by officials of the Detroit United Railway, has acquired the property and franchises of the Detroit Ypsilanti Ann Arbor & Jackson Railway. F. W. Brooks, assistant general manager of the Detroit United Railway, has been elected president to succeed J. D. Hawks.

Detroit United Railway.—Arrangements have been made for the sale of \$2,000,000 three-year 5 per cent notes to Kean, Van Cortlandt & Co. The notes will be secured by a deposit of bonds.

Evansville & Southern Indiana Traction Company.—A mortgage has been given to secure an issue of \$4,000,000 5 per cent, 30-year bonds. The proceeds of the issue will provide for outstanding debts and will redeem the bonds of the Evansville Electric Railway and the Evansville & Princeton Traction Company.

Forest City Railway (Cleveland).—The gross receipts in November, December and January were \$17,271.95. Operating expenses were \$13,333.54.

Geneva Phelps & Newark Railroad.—The New York Railroad Commission has granted this company permission to issue a first mortgage for \$700,000. The road was recently granted a certificate of necessity to build an electric road from Geneva, Ontario county, through Phelps to Newark, Wayne county, 15 miles.

Georgia Railway & Electric Company.—Gross receipts from passengers, freight, electric power and light and steam heating in 1906 were \$3,321,816.04.

Illinois Traction Company.—This company has purchased from Clark Brothers, of Philadelphia, the Mississippi river terminal line of the East St. Louis & Suburban Railway in Venice, Ill. This line gives the Illinois Traction System an outlet to the river and to its proposed bridge across the river which will give it an entrance to St. Louis.

Lake Shore Electric Railway.—It is reported that negotiations are in progress for the purchase of the Sandusky Norwalk & Mansfield Electric Railway.

Lowell & Fitchburg Street Railway.—This company has been authorized by the Massachusetts railroad commissioners to issue \$75,000 additional bonds. This makes the total bond issue of the company \$275,000 and the total stock issue \$275,000. The road was constructed and equipped by A. L. Register & Co., of Philadelphia, and consists of 18 miles of high-class interurban railway. It connects the Lowell system at Lowell, Mass., with the Fitchburg system at Ayer, Mass. In addition there is a branch of about 5 miles from West Chelmsford to Westford, Mass.

Manhattan Railway.—Attorney General Jackson of New York State has been notified that the company will pay its franchise tax for 1906 at once, if it is allowed a reduction of 11 per cent from the assessed valuation of the property, which was \$62,700,000.

Mansfield & Worcester Interurban Railroad.—The authorized capital stock has been increased from \$30,000 to \$2,000,000. It has also been decided to issue \$1,000,000 5 per cent bonds. Philadelphia people who have been interested in the company have disposed of their stock and new directors have been elected as follows: Samuel Kinsey, of Pittsburg; David Collier and M. M. Van Nest, of Wooster; John L. Barr, Charles Brumfield and B. L. Chase, of Mansfield; D. Graven, of Loudonville, and R. H. Critchfield, of Shreve. The directors elected the following officers: Samuel Kinsey, president; David Collier, vice-president; John L. Barr, secretary, and B. L. Chase, treasurer.

Manufacturers' Railroad (New Haven, Conn.).—This company has been acquired by the New York New Haven & Hartford Railroad.

Memphis Street Railway.—Isaac Newman, of Isaac Newman & Sons, in referring to the suit brought by a stockholder applying for the appointment of a receiver, has made the following statement: "We have anticipated for several months legal objections on the part of a few minority stockholders of the Memphis Street Railway Company to the plan of the American Cities Railway & Light Company, by which the latter acquired approximately 90 per cent of the stocks of the Memphis, Birmingham, Knoxville, Little Rock and Houston properties. When the plan of the American Cities Railway & Light Company was announced in June, 1906, objection was made by these minority stockholders in the Memphis Street Railway Company on the ground that the Memphis property was a much better one than the others and for this reason they were unwilling to deposit their Memphis stock under the plan. These minority stockholders, holding probably less than 10 per cent of the common stock of the Memphis Street Railway Company, have not deposited their stock, but the plan of the American Cities Railway & Light Company has in no way disturbed the legal existence of the Memphis Street Railway Company, so that the rights of the stockholders therein have not been interfered with."

Montreal Street Railway.—Gross earnings for December, 1906, were \$266,953, an increase of \$30,008. Operating expenses increased \$23,575, leaving an increase in net earnings of \$6,432. The figures for December and for the last three months of 1906 are as follows:

	December, 1906	Three mo., 1906
Gross earnings	\$266,953	\$812,036
Operating expenses	185,671	516,433
Net	\$81,382	\$295,603
Charges	39,122	119,008
Surplus	\$42,260	\$176,595

Pennsylvania Street Railways.—The annual report of Isaac B. Brown, superintendent of the state bureau of railways, shows that the capitalization of 238 street railway corporations in the fiscal year ended June 30, 1906, was \$183,653,441. Total receipts from operation were \$41,039,186. There were 3,325.33 miles of track and 8,484 cars in service. The total number of passengers carried was 949,647,802. Cost of road and equipment stood at \$140,916,635.

Philadelphia Company (Pittsburg).—The gross earnings from operations in the year 1906 were \$18,223,537.65. Expenses and taxes were \$11,107,967.60, leaving net earnings from operations of \$7,115,570.15. Miscellaneous income was \$277,672.40, making, with net income from operating, \$7,393,242.55. Fixed charges were \$4,378,209.34, leaving a balance of \$3,015,033.21.

Philadelphia Rapid Transit Company.—The Trades League takes the stand that the plan offered by the merchants' association does not provide for immediate improvement of service. In the plan which is being framed by the Trades League the provisions governing the reduction of fares and the surrender of franchises will be revised. Mayor Weaver has issued a long statement criticizing the Merchants' plan. He has not submitted a plan himself.

St. Louis & Suburban Railway.—The board of directors will be reduced by the United Railways Company, which is now in control, from 15 to 5 members.

South Side Elevated Railroad.—Gross earnings for the year 1906 amounted to \$1,788,975, as compared with \$1,713,348 in the previous year, an increase of \$75,627 or 4.4 per cent. The extra cost of operating, due largely to high prices of labor and materials, brought total expenses to \$1,207,268, as compared with \$1,052,963, an increase of \$154,305 or 14.6 per cent. Net earnings were \$581,707, a loss of \$78,678 from the previous year. The final surplus, after paying bond interest and dividends, was \$138,779, as compared with \$217,470, a loss of \$78,691. Operating expenses amounted to 67½ per cent of earnings, as compared with 61½ per cent in the previous year. Leslie Carter, the president, was elected chairman of the board of directors and Marcellus Hopkins, general manager, was elected a director and president and general manager. E. C. Nichola was made vice-president, succeeding T. J. Lefens.

The statement compares as follows:

United Railways & Electric Company.—The tax paid to the city of Baltimore in 1906 for the maintenance of parks was \$410,208. Gross earnings for the year were \$6,589,847, of which the city line earned \$4,558,985.

Washington Alexandria & Mt. Vernon Railway.—Gross earnings for December, 1906, show a loss of \$2,069.14, or 10 per cent from the December, 1905, figures. They compare as follows:

	December, 1906	December, 1905
Gross earnings	\$18,459.77	\$20,628.91
Operating expenses	11,197.44	11,879.68
Net earnings	7,262.33	8,649.33

Manufactures and Supplies

ROLLING STOCK.

Philadelphia Rapid Transit Company is figuring on 60 new passenger cars.

Sioux City Traction Company, Sioux City, Ia., will build 6 new cars in its own shops.

Forest City Railway, Cleveland, O., has ordered 50 cars from the St. Louis Car Company.

Chicago Union Traction Company has ordered 4 additional cars from the St. Louis Car Company.

San Francisco Vallejo & Napa Valley, Napa, Cal., has ordered 8 new cars from the Niles Car & Manufacturing Company.

Washington Baltimore & Annapolis Electric Railway, Washington, D. C., it is rumored, will be in the market shortly for 25 large interurban cars.

Warsaw Street Railway, Warsaw, Wis., has purchased through the Knox Engineering Company, Chicago, 3 cars for city service to be built by the Cincinnati Car Company.

Northern Ohio Traction & Light Company, Akron, O. will build 4 cars in its own shops. Delivery will soon be commenced on the 20 cars ordered some time ago from the Kuhlman Car Company.

Chattanooga Railways Company, Chattanooga, Tenn., has received 10 of an order of 15 new 40-foot semi-convertible cars from the Kuhlman Car Company. These cars are to be mounted on Brill trucks and are to be equipped with National airbrakes and Westinghouse 101 motors, four to each car. The first car of the shipment was put into service last week.

Oakland Traction Company, Oakland, Cal., as mentioned in our issue of January 19, has ordered the building of 40 double-truck cars of the California type in its Oakland shops. They will have a seating capacity of 42 to 44 persons, length over all of 45 to 48 feet, width over all 8 feet 6 inches, wooden body, underframe of steel and wood and will be equipped with airbrakes.

Citizens Railway, Lincoln, Neb., was reported in the Electric Railway Review of January 26 as having ordered 3 full-convertible cars. This order was placed with the American Car Company, and the cars are for May delivery. They will have a seating capacity of 30 persons, will weigh 17,000 pounds, will have a wheel base of 8 feet, length of car body 20 feet, length over vestibule 30 feet 6 inches, length over all 30 feet 6 inches.

East St. Louis & Suburban, as noted in the Electric Railway Review of January 26, has placed an order with the Inter-State Car Company for 200 all-wood gondola cars of 80,000 pounds capacity, and has an option on 300 additional gondola cars, for delivery in September, 1907. The details are as follows:

Weight	31,000 lbs.	Brakebeams	Dexter
Length, inside.....	35 ft. 7 in.	Brakes	Westinghouse
Over all	40 ft.	Couplers	Climax
Width, inside.....	9 ft. 4 in.	Draft rigging	Miner
Height, inside.....	3 ft. 6 1/4 in.	Journal bearings	Spiral

Special Equipment.

Bolsters, body and truck....	Journal boxes.....	Symington
.....American Steel Foundries	Springs....	Railway Steel Spring

Detroit United Railway, Detroit, Mich., as reported in the Electric Railway Review of January 26, has placed an order with the Cincinnati Car Company for 50 double-truck cars and 10 interurban cars for delivery from May 15 to June 15, 1907. The specifications call for the following details:

50 Double Truck Cars.

Seating capacity.....	41 persons	Width inside.....	7 ft. 6 1/4 in.
Weight	37,300 lb.	Over all.....	8 ft. 3 1/2 in.
Wheel base.....	4 ft. 6 in.	Height, inside.....	8 ft. 2 1/4 in.
Length of body.....	29 ft.	Sill to trolley base..	9 ft. 5 in.
Over vestibule.....	5 ft.	Track to trolley base..
Over all.....	41 ft. 4 in.	12 ft. 1 1/4 in.

10 Interurban Cars.

Seating capacity.....	45 persons	Height, inside.....	8 ft. 8 1/4 in.
Wheel base.....	6 ft.	Sill to trolley base..	9 ft. 11 in.
Length of body.....	30 ft. 2 in.	Track to trolley base..
Over vestibule.....	4 ft. 6 in.	12 ft. 5 1/4 in.
Over all.....	46 ft. 4 in.	Body and underframe....	Wood
Width, inside.....	7 ft. 4 1/2 in.		
Over all.....	8 ft. 6 in.		

Special Equipment.

Air brakes.....	Storage	10 interurban.....	Hot air

SHOPS AND BUILDINGS.

Boston Elevated Railway.—An old car barn, on Dunster street, Cambridge, Mass., which has been used by the company as a blacksmith and carpenter shop and which contained the division offices, was destroyed by fire on January 30.

Brooklyn Rapid Transit Company.—The new quarters for the line department, which are to be erected at President street, Nosstrand avenue and Carroll street, will cost in the neighborhood of \$300,000. In a general way the plans will call for new office buildings for the line and track departments, new stock buildings for the purchasing department, new machine and wheelwright shop, painting shop, carpenter shops, and new facilities for the lighting department. The company has asked for bids for the erection of all the new stations on the Brighton Beach elevated line, from Beverly road to Sheepshead Bay. There will be in all stations at Dean street, Beverly road, Avenue C, Foster avenue (express stop), Manhattan Terrace, Greenfield, Kings Highway (express stop), Avenue U, Neck road and Sheepshead Bay (express stop).—A contract has been let to Pierson & Goodrich for the construction of an incinerating plant at Third avenue and Third street, Brooklyn.

Columbus Delaware & Marion Railway.—This company is building a new freight station at Marion, O., containing platforms on each side of the track, connected by a roof, so that cars may be loaded and unloaded from either side and under cover.

Nashville Railway & Light Company.—The work of removing the buildings on Third and Fourth avenues and Cedar street has been started to make room for the new transfer station of the Nashville Railway & Light Company. Though definite plans have not been formulated, it is known that the station will be a one-story brick structure located between the tracks. The distance between the inside rails of the tracks will be 28 feet. The cars from the east and north will use the north track, and those from the south and west will use the south track. It is expected that the work of building the station and laying the track will be completed in six months.

North Alabama Traction Company.—This company has recently occupied its new car barns at New Decatur, Ala. The main building is 90 by 140 feet in floor area and the shops, which are triangular in shape, are 140 feet long and 50 feet wide at the front end of the structure. Offices and waiting rooms are provided in the building. The barn is of brick construction and is one story high.

Pittsburg & Butler Street Railway.—This company has recently let a contract for its repair shops near Butler, Pa. Contracts for equipment are expected to be let shortly. Hudson F. Layton, of Pittsburg, chief engineer.

Toledo Urbana & Interurban Railway.—This company has purchased property on St. Clair street, Toledo, O., for the purpose of erecting a large freight station.

TRADE NOTES.

Lidgerwood Manufacturing Company, has removed its Chicago offices from 1510 Old Colony building to 1917 Fisher building.

V. C. Gilpin, 120 Liberty street, New York, announces that he has been appointed eastern sales agent for the Sterling Electric Company for its flexible steel conduit and armored conductor.

Robert W. Hunt & Co., Chicago, have been appointed consulting engineers to the receivers of the Union Traction Company, Chicago, and placed in direct charge of the lowering of the car tunnels under the Chicago river.

Crocker-Wheeler Company, Ampere, N. J., at the officers' and branch managers' convention held from January 23 to 26, announced that the company had done more business during 1906 than any previous year since its organization.

Consolidated Car Heating Company, 42 Broadway, New York, has moved its purchasing department to the New York office and has appointed Mr. Claude C. Nuckols purchasing agent. Mr. T. M. May, heretofore in the employ of the National Electric Company, has been appointed a representative of the sales department.

Cook's Railway Appliance Company, Kalamazoo, Mich., on December 26, 1905, changed its corporate name to Cook's Standard Tool Company, the ownerships and management remaining the same. This change was thought advisable on account of the name "Standard" by which its appliances have so long been known to the trade.

Thos. P. Conard & Co., Harrison building, Philadelphia, issue from time to time a list of second-hand boilers, engines, locomotives, steam shovels, machine tools, etc., on hand. The company have been specialists in this line for many years. A lot of different make hoisting engines are described in a leaflet just issued which will be mailed upon request.

Wesco Supply Company, St. Louis, Mo., has purchased the plant of the Davis Electric Manufacturing Company, of Springfield, Mass., including all machinery, which it is moving to St. Louis, where it will continue the manufacture of the Davis switches and other specialties. This company has also leased a 5-story building at the corner of Eighth street and Clark avenue, which has been equipped with the latest and most modern machinery for the manufacture of knife switches, cut-out cabinets, panel boards, switchboards and other specialties. With these added facilities in full operation the company will have one of the most

complete and modern plants for the manufacture of electrical specialties in the west.

Niles Car & Manufacturing Company, Niles, O., at its annual meeting elected the following officers: President, F. C. Robbins; vice-president, T. E. Young; secretary and treasurer, Charles Rose. The following were elected directors of the company: F. C. Robbins, J. A. Hanna, I. H. Young, T. E. Thomas, A. G. McCorkle, G. D. Kirkham, W. H. Smiley, A. G. Webb and B. F. Pew.

John F. Allen & Co., 370-372 Gerard avenue, New York, manufacturers of the "Allen" portable pneumatic riveting machine, have received an order from the American Car & Foundry Company for four additional riveters, two of which are for the Jeffersonville, Ind., plant and two for the St. Charles, Mo., plant. The American Car & Foundry Company now has 125 of these machines in use in its different plants.

Niles-Bement-Pond Company has declared a regular quarterly dividend of 1 1/2 per cent on the preferred stock, payable on February 15, and a semi-annual dividend of 3 per cent on the common stock, payable in two instalments on March 20 and June 20. James P. McKinney was elected a director to succeed William S. McKinney and George T. Reiss to succeed Gordon Shillite. Other former directors were re-elected.

Hunkins-Willis Lime & Cement Company, St. Louis, Mo.—One of this company's products is the Bonanza roofing tile, a reinforced concrete tile 52 by 26 inches, which is said to be wind, weather and fireproof and not to be affected by gases, steam or fumes. This tile varies entirely in design from terra cotta clay, slate or other forms of roofing and may be laid directly on steel purlins without any woodwork in the roof construction.

Eck Dynamo & Motor Works, Belleville, N. J., has been re-organized and a new company formed to take over the business heretofore operated by C. A. Eck. The name of the company will remain the same and the manufacture of the Eck dynamos and motors and fan-motor apparatus will be continued. The officers of the new organization are: President and treasurer, William J. Wallace; vice-president, Walter G. Clark; secretary, Charles H. Dilg.

Dodge & Day, engineers, Drexel building, Philadelphia, announce that John E. Zimmermann, formerly secretary of the American Pulley Company, of Philadelphia, has become a partner in their firm, effective January 1. This firm is building the shops of the Jones & Lamson Machine Company, at Springfield, Vt.; also is engineering and constructing a new building for the Bridgeport Brass Company. The steel for both of these buildings has been ordered and construction commenced.

Chicago Pneumatic Tool Company, Chicago, for the year ending December 31, 1906, shows the percentage earned on the outstanding stock to be 11.23 per cent as compared with 9.16 per cent in 1905. The statement of profits, together with the balance sheet, is as follows:

Green Fuel Economizer Company, Mattawann, N. Y., has awarded to the Berlin Construction Company of Berlin, Conn., the contract for an extension to its fan shop which, when completed, will enable them to more than double their present output. A shop has also been erected exclusively for manufacturing the new patent Green steam and hot-water heating coil. The large amount of business enjoyed by this company in these lines

and in the manufacture of fuel economizers has compelled them to acquire for building purposes several acres of land adjacent to its present property.

Chicago Engineering & Construction Company, Great Northern building, Chicago, announces the retirement of Hervey B. Hicks and George A. Yulle as managing directors, Mr. Yulle continuing as manager of the office of the company at Monroe, La. The new officers of the company are William G. Luce, president; Percy A. Wells, vice-president, and Harry L. Wells, secretary and treasurer. The general offices of this company were moved on February 1 to 1014 Menadnock block, Chicago.

Henry Clark Sergeant, whose name as a part of the Ingersoll-Sergeant Drill Company has long been known wherever compressed or rock drills are used, died of paralysis at his home at Westfield, N. J., on January 30, at the age of 72 years. He was born at Rochester, N. Y., in 1835 but his earlier years were spent in Ohio. He had always shown an inventive faculty and a number of his inventions when put into systematic operation did much to expedite and facilitate some of the most difficult of engineering problems, the appreciation of which can only be realized by the results obtained. His inventions are many and various, the most pronounced of which cover details in the construction and operation of air compressors, rock drills and mining and excavating machinery. After the consolidation of the Ingersoll-Sergeant Drill Company and the Rand Drill Company in 1905 he retired from active participation in business but still retained his financial interests.

ADVERTISING LITERATURE.

Lumen Bearing Company, Buffalo, New Jersey.—The second of this company's series of monthly art calendars for 1907 is entitled "An Upland Road," reproduced from the original painting of that name by Paul Dougherty.

S. F. Bowser & Co., Inc., Fort Wayne, Indiana.—A pamphlet which has just been issued by this company shows the possibilities in the way of lubricating oil storage which permits neatness, convenience and accuracy in measuring.

R. Woodman Manufacturing & Supply Company, Boston, Mass.—A pocket catalogue giving details, descriptions and prices of an extensive line of punches manufactured by this company has been received. In addition to punches, the company also makes baggage and other brass checks and all kinds of badges and buttons.

Crocker-Wheeler Company, Ampere, New Jersey.—Bulletin No. 74 describes engine type alternating current generators. The various elements including housing, rotor, coils, etc., are described and general information given regarding generators of this type. A number of views are shown of plants where the Crocker-Wheeler alternators are installed.

Goldschmidt Thermit Company, 43 Exchange Place, New York, N. Y.—Thermit is now so well known for welding purposes that it is hardly necessary to enumerate the different classes of welding to which it is particularly applicable. An attractive little pamphlet gives details of a welding outfit and the welding compound and indicates by engravings from photographs, the possibilities of Thermit.

The Locke Insulator Mfg. Company, Victor, New York.—One of the handsomest catalogues which has been received for some time is that which has been issued by this company listing an extensive line of insulators for electric power transmission purposes. The various types of insulators are shown by fine engravings from photographs and the tables giving dimensions are conveniently arranged.

New Era Manufacturing Company, Kalamazoo, Michigan.—A new booklet has just been issued by this company entitled "Valuable Information for Superintendents and Foundry Foremen." It should be of interest to superintendents and foremen in all lines of foundry work as it gives a number of valuable hints designed to aid in the production of good castings together with formulas for the composition of metal for use in many different classes of castings.

Buda Foundry & Manufacturing Company, Chicago.—Bulletin No. 105 illustrates and explains Buda lining-up jacks, which are a recent manufacture of this company placed upon the market within the past month. The jack, which, as its name indicates, is for lining-up purposes, combining elevating and transferring features operated by a single interchange of the lever. It is designed to decrease the necessity of employing a large number of men for lining track.

C. Druckille, 132 Reade Street, New York, N. Y.—"Railroad Sandcraft" is the title of a 24-page booklet describing the injector sand blast apparatus manufactured for cleaning steel cars, locomotive work, steel bridges and other structural work. The sand blast is now such an essential piece of apparatus for use in preparing steel cars and steel structures for repainting as well as in preparing the steel for its original coating that it is believed this publication will prove of general interest.

Ingersoll-Rand Company, 11 Broadway, New York, N. Y.—Catalogue H 36, which has just been received, is a handsomely printed and illustrated publication of 64 pages, describing a single line of air compressors, known as "Type 11," out of the great variety built by the company. The compressors are duplex steam-driven, automatic machines mounted upon a single base and entirely contained. A large number of combinations of steam and air cylinders are provided for in sizes ranging from below 10 to above 200 horsepower. The catalogue furnishes a description of the

various machines and a discussion of their functional relations and their adaptation to special and exacting conditions together with lists of general dimensions, capacities and other details.

Charles F. Johnson, Citizens' Building, Cleveland, Ohio.—Mr. Johnson, who is a dealer in second-hand electrical, steam and contractors' equipment, issues a list from time to time of equipment which he has on hand. Recent lists show an extensive line of cars, motors, snow sweepers and plows on hand for electric railways.

Power & Mining Machinery Company of Cudahy (suburb of Milwaukee), Wis., in conjunction with the Snow Steam Pump Works of Buffalo, N. Y., has opened a new sales office at 719 White building, Buffalo, where will be handled the several types of gas generating apparatus, such as the Loomis-Pettibone system, suction and pressure gas plants, built by the Power & Mining Machinery Company, and the Snow gas engines, built by the Snow Steam Pump Works. Mr. Seward Babbitt, the sales manager of the first-named concern, will make his headquarters at the Buffalo office, on account of the facility for conducting business from that point.

Wendell & MacDuffie, 26 Cortlandt St., New York, N. Y.—A new catalogue issued by this company is a 24-page booklet known as No. 16, which describes fully the asbestos and cement fire-proof materials manufactured by them. The line includes reinforced asbestos corrugated sheathing, a strong and durable composition of asbestos and cement compressed under a high pressure and reinforced with $\frac{3}{8}$ -inch woven wire mesh, asbestos building lumber, designed for use in construction work in electrical plants of all kinds for insulations, door panels, telephone switchboards, etc., and Century asbestos shingles are features of the company's line of manufactures.

Rostand Manufacturing Company, Milford, Conn., manufacturer of the McCarthy hat and baggage rack, states that its business is growing and the railroads are coming more and more to recognize the advantage of a rack well constructed and able to stand heavy usage by passengers. A number of roads have placed orders for these racks for their new equipment and in many cases are replacing as fast as the cars are sent to the repair shop the old racks with the McCarthy rack. F. A. Barbey, 185 Summer street, Boston, and George H. Bryant, 1055 Old Colony building, Chicago, represent the Rostand Manufacturing Company in their respective territories.

The Concrete Review.—The Association of American Portland Cement Manufacturers announces the publication of the Concrete Review, Volume 1, Number 1 of which appeared on February 1. The publication is to be semi-monthly and is to meet the growing demand for the most reliable information regarding the proper use of Portland cement and serve as an easily accessible guide to the best articles appearing in the various technical publications. Original articles will be published together with extracts from articles which appear in other publications. The Concrete Review will be sent upon request addressed to the assistant secretary of the Association of American Portland Cement Manufacturers, Land Title building, Philadelphia.

NEW DIRECT-CURRENT MOTORS FOR INDIVIDUAL MACHINE DRIVING.

Illustrations are herewith presented showing a new line of direct-current motors manufactured by the Allis-Chalmers Company which are designated as "type K." Several interesting features are embodied in this new design. The cylindrical field magnet yoke is of open hearth steel and machined on each end to receive the housings that carry the bearings. The housings are held in place by through bolts and, on four-pole machines, can be rotated 90 degrees or 180 degrees to allow side-wall or ceiling mounting; bi-polar machines can be arranged for floor or ceiling mounting. The yoke is machined on the inside cylindrical surface and the poles are fastened to it by countersunk fillister-head cap screws. The pole cores are of open hearth steel and are circular in cross section; these cores are machined on one end to fit the inner surface of the cylindrical yoke and on the other to receive the pole shoes. The latter are built up of annealed steel punchings riveted together and fastened to the poles by flat head machine screws. The pole face has been carefully shaped to give suitable distribution of the field flux, thus securing good commutation and preventing humming due to the armature teeth. Except for the smaller sizes, the field coils are wound on metal spools, and are covered with sufficient insulation coated with varnish to protect them from external injury or moisture.

The armature cores are built up of sheet steel punchings insulated from each other to reduce the core loss and consequent heating. The laminations are keyed to the shaft, and in building up the core they are separated at intervals so as to form radial ventilating ducts. The punchings are firmly clamped between cast iron end heads, which also serve as supports for the ends of the armature coils. In punching the armature laminations, openings are made in the discs, so that when the latter are assembled, ventilating passages are formed parallel to the shaft and connecting with the radial ducts. There is thus a free passage for the circulation of air through the core, and all parts of the core and windings are thoroughly ventilated.

The armature coils are form wound and interchangeable; they are heavily insulated with stay binding and the whole armature is thoroughly impregnated with insulating varnish after it has been completely wound.

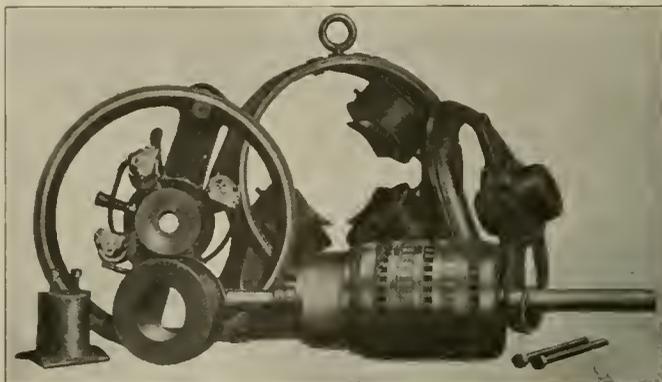

The commutator is of large diameter and ample wearing depth, having bars of hard-drawn copper insulated from each other and from the shell by the best quality of mica; the mica between bars is so selected that the wear is uniform. The clamping

rings hold the bars firmly and the whole construction is such as to secure a perfectly cylindrical surface free from high or low bars.

In all except the smaller sizes, the commutator sleeve is hollow to permit the passage of air through to the armature.

The bearings are of ample size and lubricated by oil rings. The shaft projection for the pulley is turned smaller than the journals, so that the journal can be turned down, when worn, without reducing its diameter below that of the projection.

The brush holders are of the same general design as used

Allis-Chalmers Type-K Motor Dismantled.

on all the standard direct current machines. The brush studs are fastened to a rocker arm mounted on the bearing housing; this allows the brushes to be set at the best running position, but, after being once properly set, they require no adjustment under any change in load within the range of the motor. Graphite brushes are used, connected to the holders by flexible copper shunts.

The frame of the standard Type K motor is open at the ends to permit a free circulation of air through the machine. It can, however, be converted into a semi-enclosed or a totally enclosed motor by the addition of suitable metal covers which are readily fitted to the end housings. For the semi-enclosed type the covers are perforated.

These motors are manufactured in 13 different frame sizes, and for each size there are a number of ratings, the output of a given frame being proportional to the speed.

These motors are suitable for all classes of work where either

Allis-Chalmers Type-K Motor.

a constant or variable speed direct-current motor is required. For general driving of machinery or for variable speed work shunt-wound machines are used. For cases where a large starting torque combined with the constant-speed characteristic of the shunt motor is required, compound-wound motors can be furnished. For crane and hoisting service series-wound motors are supplied.

Type K machines operate exceptionally well as generators which are compound wound, and will deliver any current from zero to their full rated output without sparking and without shifting the brushes.

Although the city council of Chicago passed the Chicago City railway and the Chicago railways. (Union Traction)

Voters to Pass On Chicago Ordinances.

ordinances over the mayor's veto at its meeting on February 11, the companies have announced that they will not consider the ordinances operative unless they are approved by the voters at the election on April 2. There seems to be little doubt that the ordinances will be approved by a large vote. The Chicago Real Estate Board and the Chicago Commercial Association, two of the leading organizations of the city, have decided to make every effort to secure the approval of the ordinances. Other civic organizations which are also vitally interested in the improvement of the street railway service will take similar action. The veto message of Mayor Dunne raised points which the aldermen considered had been thoroughly thrashed over in the meetings of the local transportation committee before the measures were drafted and for that reason his objections to the passage of the ordinances at this time had no effect.

The report of the first three months' operation of the Municipal Traction Company of Cleveland is interesting.

Municipal Traction Earnings in Cleveland.

Revenue passengers were first carried on November 1. The company earned, during November, \$2,926.50; during December, \$4,811.67, and during January, \$7,703.93; in addition to which it reports a lump sum of \$1,830.75 as earned from "other sources" during the three months. Against the total earnings of \$17,271.85 there was a total operating cost, including rental, of \$16,985.09, or 93.13 per cent, leaving a balance of \$1,186.86. Until January 16 the company was unable to run its cars to the Public Square in the center of the city. It is interesting to observe, therefore, that the earnings from January 16 to January 31, inclusive, aggregated \$5,341.11 and the operating expenses \$3,466.79, not including the rental charge. This operating ratio is so extremely low, when it is remembered that it is in comparison with gross earnings based on

3-cent fares, that it is only too plain that it could be realized only during a period in which repairs and renewals were not part of operating expense. It leaves a balance, for the sixteen days, of net earnings equal to \$1,874.32 or on the basis of about \$45,000 annually. The latter sum would just pay the 6 per cent per annum due on the \$750,000 of par value of the shares of the underlying company to which the Municipal Traction Company is pledged. Apparently, then, the success of the enterprise is conditioned upon a considerable growth in traffic or its ability to get along without charges for repairs or renewals—the latter an obviously impossible requirement.

The rapid development of electric railways is forcing new questions upon the state railroad commissions, and although

Jurisdiction of State Commissions.

In some states the laws have been amended to include the interurban railroads within the jurisdiction of the state commissions, in others they have not been modified to meet the changed conditions. The

South Dakota commission in its annual report says: "A few states have already placed electric roads under the authority of their railroad commissioners in respect to the matter of crossing other roads, but in general there is one law for railways using horse, mule, cable or electric power and designated as street railways, and another for those employing steam power, as in our state. Now that street railways are expanding into interurban roads giving passenger and freight service over extended lines and offering similar service to that of the steam roads, it is found that the laws should be changed to meet the new conditions. A notable example of the extension of electric lines within our state is the comparatively recent transformation of the Chicago Burlington & Quincy line between Deadwood and Lead from a steam railway into an electric line. In case the commission was asked to allow an electric road to cross the tracks of a steam road at grade, the question would at once arise, 'Has the commission any authority to do so?' the law as it now is giving the commission only general supervision over all roads operated

by steam. The law should be so amended as to give the commission general supervision over all railroads or railways operated by steam or electric power, street railways only excepted." Other states are considering the same problem and it is evident that something must be done at once to relieve the inconsistency of the situation. The sooner the electric interurban railroad is recognized by the state legislatures the better it will be for all concerned. Of course there are difficulties to be met, for instance in regard to the distinction between city and interurban lines, but the matter is one that cannot be neglected with impunity and many needless complications will be avoided by facing the problem at once.

Coating the inside of boiler tubes with a thin layer of graphite is a "kink" that has given excellent results in a boiler plant using water containing excessive amounts of scale-forming salts. These deposits have required frequent drilling of the tubes. It was found by experience that much less scale adhered to the tubes coated with graphite and that the scale which did form was far more easily removed from them than from uncoated tubes. The application of graphite might be said to have insulated the steel from deposit and thus rendered the tubes more easily cleaned; and when cleaned their interiors appeared perfectly smooth without the usual patches of scale remaining as is the case after a tube has been bored with a turbine-cleaner. The one application of graphite so adhered to the metal that the interior of the tube had the appearance of a gun barrel, the graphite coat remaining intact after several cleanings. The graphite may be prepared for application to the interior of tubes by mixing it with pure mineral oil in an amount sufficient to form a thick paste, or it may be applied dry.

EXCHANGE OF FREIGHT WITH STEAM RAILWAYS.

In the effort to develop new sources of business, traffic managers of various electric railway companies have tried, sometimes successfully and sometimes without acceptable results, to secure the establishment of joint tariffs and through routes with steam railway companies. Reciprocal arrangements of this kind have been found advantageous in a number of instances.

The Interstate Commerce Commission has been petitioned by the Cedar Rapids & Iowa City Railway & Light Company, of Cedar Rapids, Ia., to establish joint rates on cereals and live stock between points on its line and points on the Chicago & Northwestern Railway Company lines.

The commission held meetings in Cedar Rapids on January 29 and 30, at which the evidence was heard. The Cedar Rapids & Iowa City operates an electric railway between those two cities, a distance of about 28 miles. It is built upon a private right of way 100 feet wide for practically the entire distance. The road is built according to steam railway standards with a 1 per cent grade, and no curves exceed 3 degrees, except one of 4 degrees. The bridges were built to accommodate heavy steam railway traffic. The territory through which the electric line passes is not served by any other railway except at terminal points. The company has exchanged considerable business in carload lots with the different steam railways. Last year it handled 450 cars of live stock.

The steam railways have refused to establish through routes and joint rates and the company was obliged to charge the Iowa distance tariff from the town of shipment to Cedar Rapids. The steam railways then charged their local tariffs from Cedar Rapids to destination. After the enactment of the Hepburn law the company applied to the different railways for routes and rates and, after these were

refused, entered a complaint with the commission. After hearing the evidence the commission adjourned and it is expected that the arguments will be heard within a few weeks.

In its answer to the complaint filed with the commission, the Chicago & Northwestern took the position that the Cedar Rapids & Iowa City is not engaged in interstate commerce and is not subject to the provisions of the interstate commerce law. The Northwestern asserted that the electric railway has no facilities for handling freight and that when freight has been received for shipment from points on the electric road, the Northwestern has been obliged in every instance to furnish the necessary equipment. The electric railway, the Northwestern alleged, has never delivered or offered to deliver cars loaded with live stock, grain or other freight. The Northwestern also maintained that the business which originates on the electric road is not sufficient to warrant the establishment of joint rates.

The business of several electric railways with steam roads is of considerable importance. The St. Louis & Belleville Electric Railway Company of East St. Louis, Ill., hauled and delivered to steam roads last year about 350,000 tons of freight, consisting chiefly of coal, which was carried on a 40-cent rate. This rate is charged by all the steam roads in that district. The amount of tonnage received by the electric company from steam roads was not so large, but it averaged probably 10 carloads a day. The business of the company is entirely in carload lots. No passenger cars are operated. The principal commodities transported which were exchanged with steam roads were coal, lumber, stone, brick, pitch, sand, macadam, mine props, powder and mine rails.

The Omaha Lincoln & Beatrice Railway Company of Lincoln, Neb., limits at present its interchange of freight with steam railways to joint switching of carload lots. Since the traffic arrangements were entered into the business has averaged about 5 cars a month. After the line from Lincoln to Omaha is finished, which it is expected will be this year, the management believes its business with steam roads at the two terminal points will increase. There are 6 miles in operation, over 5½ of which carload lots of freight have been switched.

The experiences enumerated above indicate that the possibilities of developing traffic relations with steam roads are worthy of serious consideration by those officials of electric railways who are responsible for growth in traffic.

TRACK RENTAL AT INTERURBAN TERMINALS.

It is generally acknowledged that the best city entrance for an interurban line is over private right of way. However, financial conditions and the development of many interurban lines as extensions of suburban systems have made it necessary, in most cases, for interurban companies to rent track privileges from local street car companies. It is not believed that there is uniformity in the methods of charging for such privileges.

Probably the most common way of renting city tracks for the use of interurban cars is at a fixed rate per passenger carried. Such rates vary from 2½ to 5 cents per passenger. If the haul is more than one and a half miles it would seem that a charge of 2½ cents per interurban passenger would not yield very much profit to the city company, unless the interurban traffic were very great. On the other hand, if the interurban company furnishes its own cars and trainmen and the distance is less than three miles, a charge of 5 cents per passenger carried would seem to be excessive. The mileage of the tracks rented is a very large factor in the rate to be charged, if the rental is to be on a per capita basis.

In some cities contracts have been made which allow the interurban cars to operate over the city tracks at a fixed

rate per mile run. In one instance a charge of 20 cents per car-mile is made. As a standard method of computing such rentals would be useful in many cases, it is suggested that perhaps the most satisfactory way for two electric railway companies to consider such situations would be to base the charges on the ton-mile as a unit. The weight of city and interurban cars under normal operating conditions could be ascertained, and with a knowledge of the schedule, the number of ton-miles made in a day, a month or a year could be approximated closely without any difficulty. In the smaller cities where single-truck cars are used it probably would be found that the interurban cars would weigh twice as much as those of the city company, so that each trip of an interurban car would count for two trips, or perhaps a fraction more, of a city car. As the question of the weight of passengers or freight carried would include factors of intricate detail it probably should not be considered.

After the proportionate use of any route has been determined according to the ton-miles operated, the cost per mile of the track and overhead construction as used by the interurban cars could be ascertained and interest thereon be allowed at the rate of 5 or 6 per cent. To this should be added the cost of maintenance, including all necessary repairs, removal of snow, sprinkling, etc. A further sum should be added for depreciation and while an exact estimate of this charge might not be possible in the beginning, an amount equal to a fixed rate could be set aside each year and the totals readjusted at definite periods of say five or ten years.

The combined amount of these three items—cost of roadway, maintenance of roadway and depreciation—should be divided by the ton-miles operated over the track included in the estimates and the proportional amounts charged to each company. This will afford a basis for making rates, but to such a unit should be added the cost for power, which could be paid for by the interurban company according to the number of kilowatt-hours used. If the price per kilowatt-hour could not be agreed upon in advance it would be well to determine the cost of power at the switchboard, including the interest, maintenance, depreciation and all power-house expenses, and to this add a fixed percentage as profit for the generating company.

In determining the final amount to be charged per ton-mile as here outlined some allowance should be made to the city company for the expense and labor it has called into play in making available a terminal for the interurban company. This charge might appear as a fixed percentage of the actual cost as determined, or as a lump sum per month which, though small, would yet be a steady income to the city company and one which the interurban company could well afford to pay. If the city company were anxious to promote the construction of interurban lines radiating from its terminals it also could afford to make concessions as to the later cost for the first few years until the interurban road had been placed on a paying basis. Without this charge the city company would derive some benefit from a reduction in its interest charges and any other charges resulting from the increased use of its tracks.

Only city companies that have trackage facilities not occupied to their limits, and therefore an investment which is not earning as much as it might, can afford to allow interurban cars on their lines. The question becomes with them not how much they are really entitled to receive for the use of the tracks, but: we have an investment which is idle part of the time. Any compensation which represents more than the cost of track and roadway maintenance and power is therefore so much clear gain.

The rules governing the operation of foreign cars on city tracks should be simple and it should be obligatory that the interurban company's employes observe the existing rules of the city system. It is thought that in many of the terminal situations where in some cases needless time and

ability have been wasted in arguing over a lump sum to be paid by the interurban company for its yearly rentals, an agreement could satisfactorily be made if the problem were attacked on a unit basis, using the ton-mile as a foundation.

THE INSTRUCTIVE VALUE OF WORKING EXHIBITS.

The increasing power and complexity of cars recently built for rapid-transit service imposes a burden of no little responsibility upon those charged with the instruction of train and car-service men. For several years trainmen, and it is suggested that similar advantages should be given shopmen, have been instructed in their duties by supplementing oral or printed teaching with practical study of actual car equipments. A familiar feature of the latter method is the provision of schoolrooms fitted with controllers, brake-valves and cylinders, train lines, signal lanterns and illustrations of detail parts of the rolling stock. The addition of air-compressor outfits and working control circuits makes possible better teaching than was feasible without the vital stimulus of using power in the concrete. For this reason the modern trainmen's school, when equipped with skeleton cars and complete electrical apparatus, becomes a most efficient factor in preparing men for actual service. Of course, it is a mistake to assume that a new man placed in the car service has little more to learn after his two or three weeks of preliminary instruction. In the exacting routine of platform work new men often need friendly encouragement as the mastery of the equipment with respect to locating troubles on the road comes only with experience.

There appears to be no single part of the car equipment that all new men find especially hard to understand. With some new motormen the fundamental principles of the brake-valve are hard to grasp; with others, the understanding of the contactor, reverser or master-controller wiring may be a stumbling block. Much can be done to aid in the explanation of these points by exhibiting diagrams of circuits clearly drawn on a large scale and by including as a part of the teaching equipment sections of the braking apparatus.

The Boston Elevated Railway Company has gone even farther than to provide dummy cars with actual equipment in its trainmen's school. A special blackboard with sketches of the main motor-circuits, resistances, circuit-breaker, fuse and contactors painted upon it is mounted behind the corresponding groups of equipment on an instruction car. In each circuit on the drawing is inserted an incandescent lamp, which automatically lights whenever the current flows through the corresponding circuit on the dummy train. The change from series to parallel can plainly be seen as well as the flow of current in the reverse circuit.

There is no question that the use of the lamps helps the men materially in understanding the circuit changes and the scheme is a simple one which easily could be adapted for use in less elaborately equipped schools. The great point to be remembered in work of this nature is that electrical conceptions quite probably are foreign to the minds of applicants for train-service positions.

A large wall-drawing of the electro-pneumatic brake system which is used on the later type of cars has been found to be an effective aid to instruction. The valve handles on the drawing are made of celluloid cut to the proper shape and pivoted. All the other movable valves of the instruction equipment as well as the brake piston rod and rotating contacts are constructed of stiff pasteboard, so that the exact function of each part can be seen.

Such refinements may be considered by some as too elaborate, but when we consider the relative importance of high-class trainmen, well acquainted with the cars which they operate, it is easily seen that facilities for careful and thorough instruction are excellent investments.

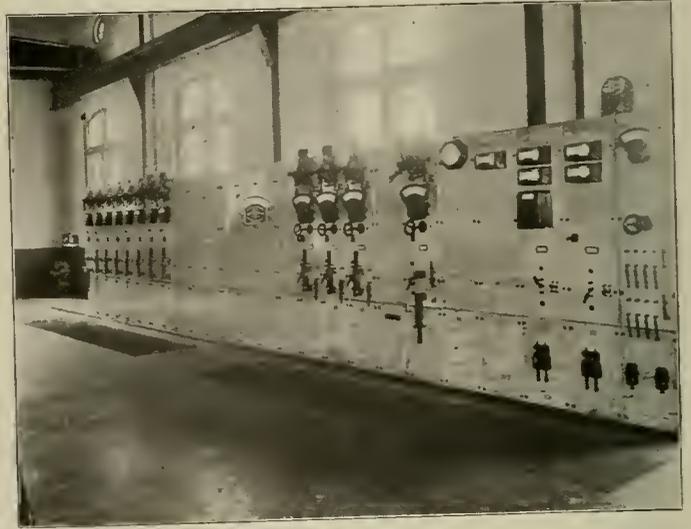

NEW SUBSTATION OF THE INTERNATIONAL RAILWAY COMPANY, BUFFALO, N. Y.

The Seneca and Elk streets substation of the International Railway Company of Buffalo, N. Y., with an ultimate capacity

and switch cells for five 1,000-kilowatt rotaries and a double-feeder booster. It now contains one 1,000-kilowatt and three 400-kilowatt machines, which latter will be replaced by larger units as the service requires. Blank panels are provided in the switchboard, and all conduit is in the floor for a sta-

Seneca Street Substation, Buffalo—Interior View Showing 1,000-Kw. Rotary and Busbar Compartments with Doors Removed.

Seneca Street Substation, Buffalo—Switchboard.

of four 400-kilowatt rotaries, became overloaded during the winter of 1905-1906. It could not conveniently be extended, and, as it was located in a section of the city which is flooded at least once each year by the overflowing of the Buffalo river, it was decided to build a new station and to locate it outside the district subject to flood. The new Seneca and Imson streets substation just completed and described and illustrated herewith, is outside the area that is sub-

tion containing seven 1,000-kilowatt rotaries, a storage battery with its booster set and a two-feeder booster set.

Power Supply.

The southeast section of Buffalo is growing rapidly, and with the mustering into service of the heavy, electrically-heated "5,000-type" cars it is expected that the new substation will soon carry a load that will show not too great a margin of reserve capacity. It is not to be expected, however, that the section which can be economically fed

Seneca Street Substation, Buffalo—Interior View Showing 1,000-Kw. Rotary and Three 400-Kw. Rotaries.

merged at the times of highest water, and is as near the load-center of the southeastern section of the city as was the old station.

Sufficient land was purchased to accommodate an extension of the converter station, a storage battery house, and leave a driveway all around the property. The present station is complete with space, switchboards, bus compartments

from this station will ever produce a load beyond the capacity to which the station can conveniently be increased.

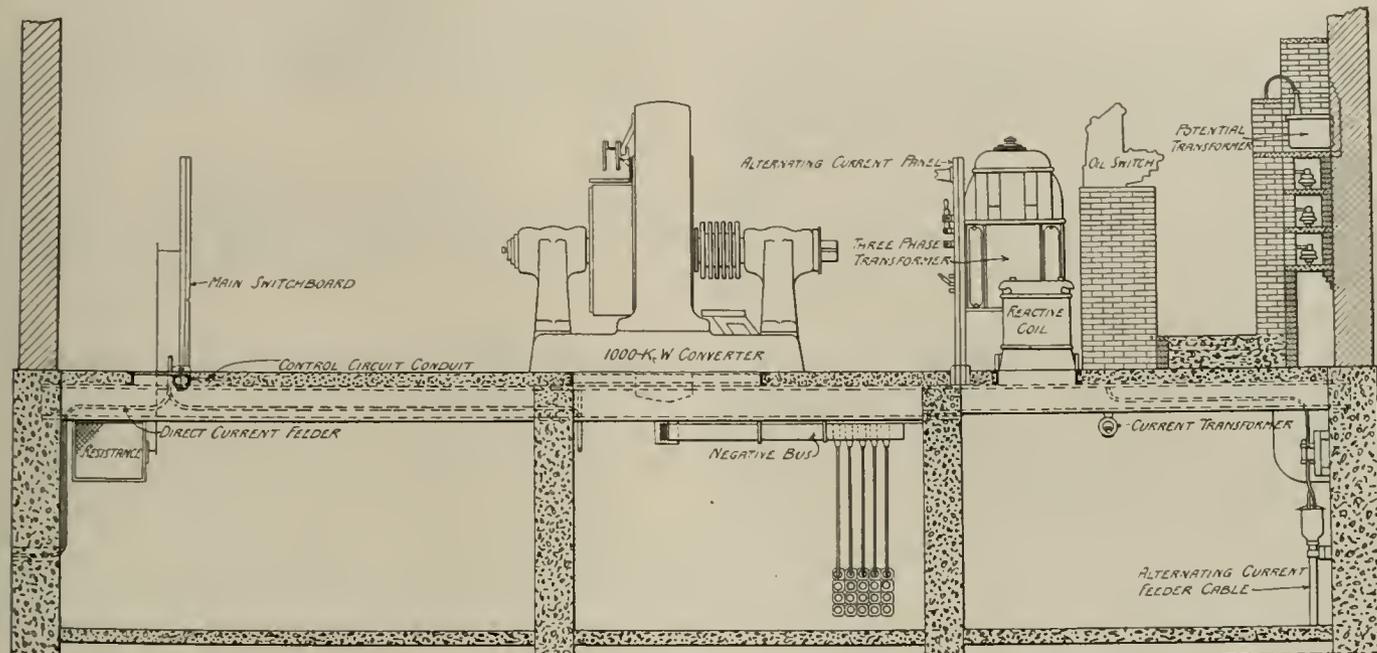

The new substation is supplied with power by means of underground cables of the Cataract Power & Conduit Company, Buffalo, distributor of power from the Niagara Falls Power Company and Canadian Niagara Power Company. The International Railway Company has a steam plant in Buffalo

which supplies alternating-current power in parallel with Niagara Falls power to some of its other substations, but the cables to this particular substation are not connected with the steam plant. An accompanying load chart exhibits a total load curve for the city of Buffalo and also load and voltage curves for the substation described herewith. The

wanda and Lockport have storage batteries. The International Railway Company supplies power to its Canadian division from its own hydro-electric plant situated at Table Rock, Niagara Falls, Ontario.

Building Construction of New Substation.

In excavating for the foundations, a solid, flat stratum

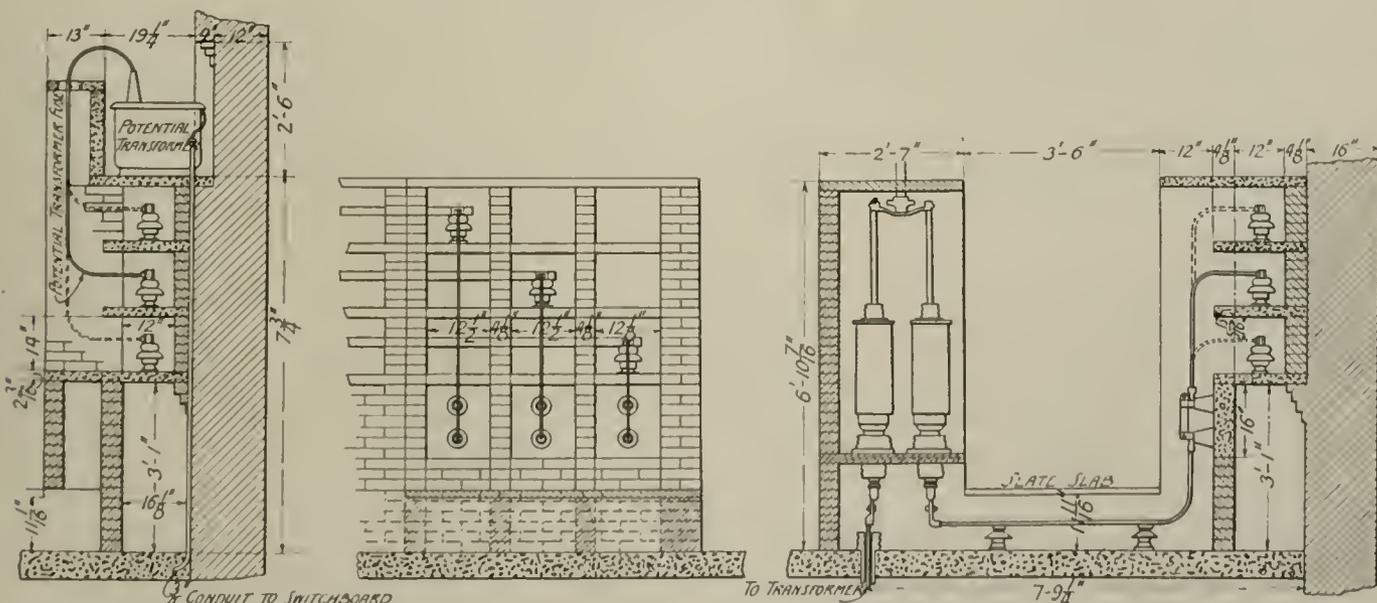

Seneca Street Substation, Buffalo—Cross-Section Showing Arrangement of Apparatus.

largest Buffalo substation is that at Virginia and Washington streets, containing six 1,000-kilowatt rotaries, a motor-generator lighting set and two 1,500-horsepower (one hour rating) storage batteries and boosters. Other city substations are at Walden avenue and the Belt Line, and in the Niagara street steam plant.

The interurban and other divisions of the system out-

of smooth rock was found within a few inches of the depth to which it had been planned to dig. The rock had a slight incline (less than one foot in the length of the building) and it was only necessary to cut out a small channel in this to accommodate sewer pipes for the drainage of the building. On this admirable foundation the walls are carried up to grade with concrete. The superstructure is of red shale

Seneca Street Substation, Buffalo—Busbar Compartments and Method of Making Switch and Potential Transformer Taps.

side of the city of Buffalo are supplied with power from substations located at North Tonawanda, Lockport, Ocott and in Power-house No. 1 of the Niagara Falls Power Company.

All of these stations operate on power from the Niagara Falls Power Company and those at North Tona-

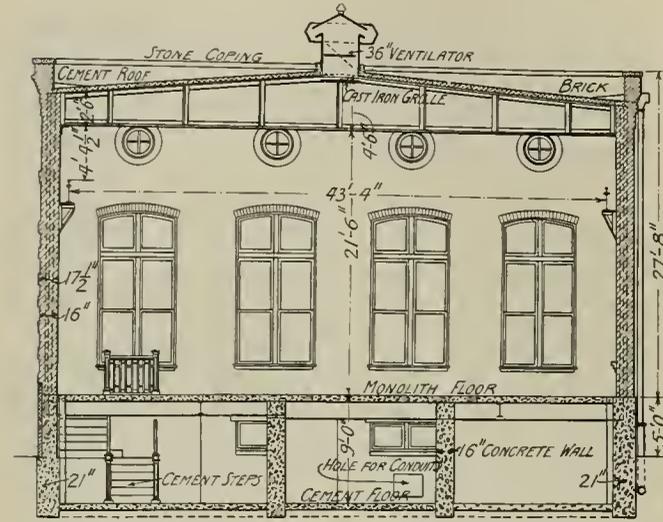

brick with sandstone trimmings, and concrete floors and roof reinforced with expanded metal and half-inch iron rods spaced six inches apart.

Floor Construction.

In preparing the main floor heavy I-beams were arranged so that their tops are at the same level. The various floor

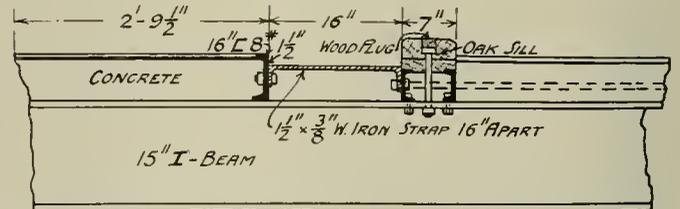

openings were then framed-in with 6-inch channels resting on top of the beams. The floor consists of 5½ inches of concrete finished off with ½ inch of monolith surface. The process of laying the floor was as follows: After placing the wood forms, ½-inch round-iron rods spaced 6 inches

of cheapness in laying, perfect symmetry of short ends and no difficulty about keeping the ducts close to the expanded metal at all points, thus obtaining the maximum possible depth of concrete above the ducts and preventing fractures in the concrete. The flexible conduit comes nearly enough to being water-tight for practical purposes. Where the conduits come horizontally out of the floor they are led through holes of suitable size drilled in the channels and the ends are capped with rigid outlet bushings secured snugly against the channels. Where the ducts pass vertically upward or downward out of the floor a solid steel elbow is at-

Seneca Street Substation, Buffalo—Cross-Section Showing Details of Building Construction.

apart were laid and covered over with expanded metal, the two being wired together firmly. The control-wiring conduit of flexible steel tubing was then put in place and wired to the expanded metal. When the concrete was poured, the rods, expanded metal and conduit were all lifted together so that no portion of the metal was within ½ inch of the

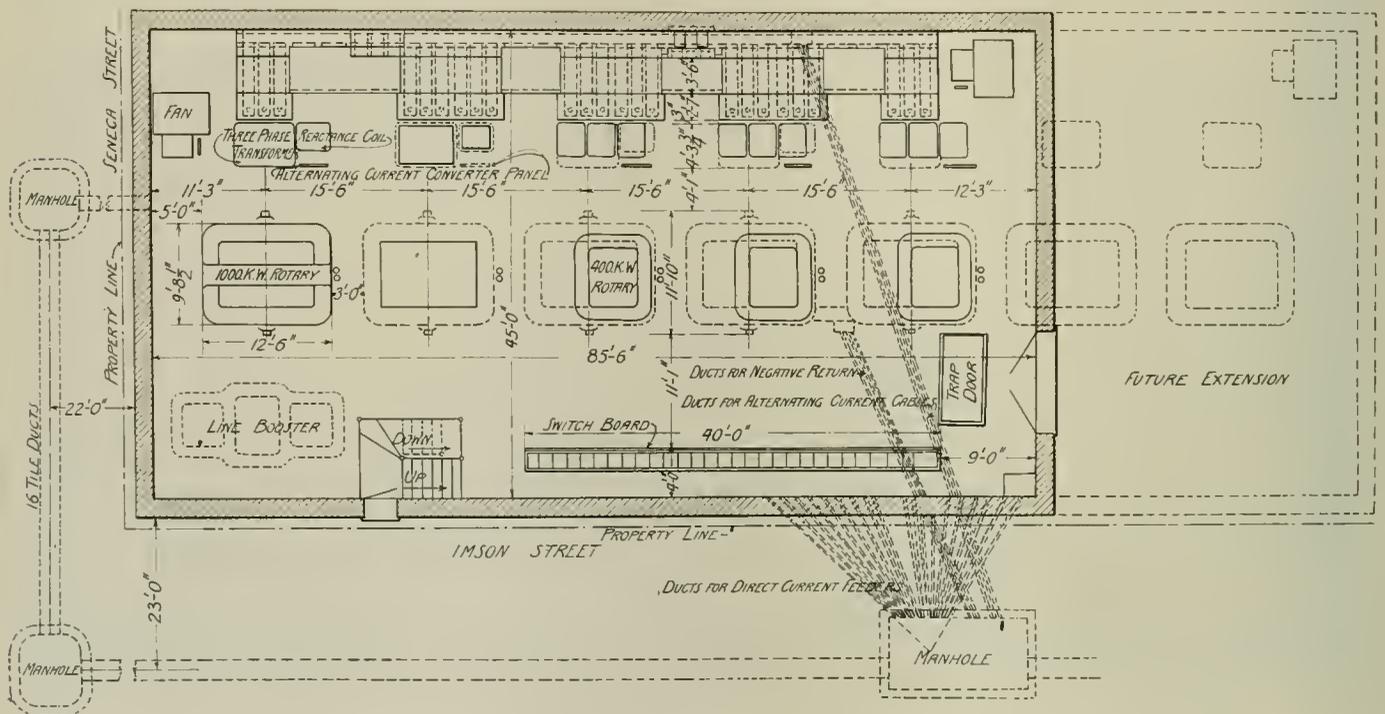

Seneca Street Substation, Buffalo—Details of Switchboard Slot.

tached to the flexible duct, enough of the elbow being embedded in the concrete to render an unyielding outlet fixture.

On account of the proximity to the flooded district it was decided to place the high-tension busbar compartments, disconnecting switches, etc., on the main station floor, instead of in the basement as has been done in many recent installations. This location also has the advantages of avoiding the dust that is always blown into the air chamber by the fans, and it brings the disconnecting switches where the operator does not have to leave the machinery to manipulate them.

The high-tension busbar structure is built up of Kittanning re-pressed buff brick, laid with ¼-inch joints in cement-

Seneca Street Substation, Buffalo—Plan Showing Present and Future Arrangement of Apparatus.

falsework. The result is a strong and most satisfactory floor, smooth on both sides. The monolith has the advantages of not staining with oil, cracking, giving off dust and not being as hard under the feet as concrete. It is also easy to keep clean and can be patched readily.

The use of flexible-steel conduit offers the advantages

tempered mortar. The disconnecting switch slabs and busbar barriers are of concrete. The busbars are supported on iron-capped porcelain insulators of the pole-line type. The insulators are on iron pins set in the horizontal barriers. The hanging barriers for the cable-disconnecting switches in the basement are built up of transite board glued to wooden

frames and painted. The busbar compartments and switch cells are completely covered with doors of transite board.

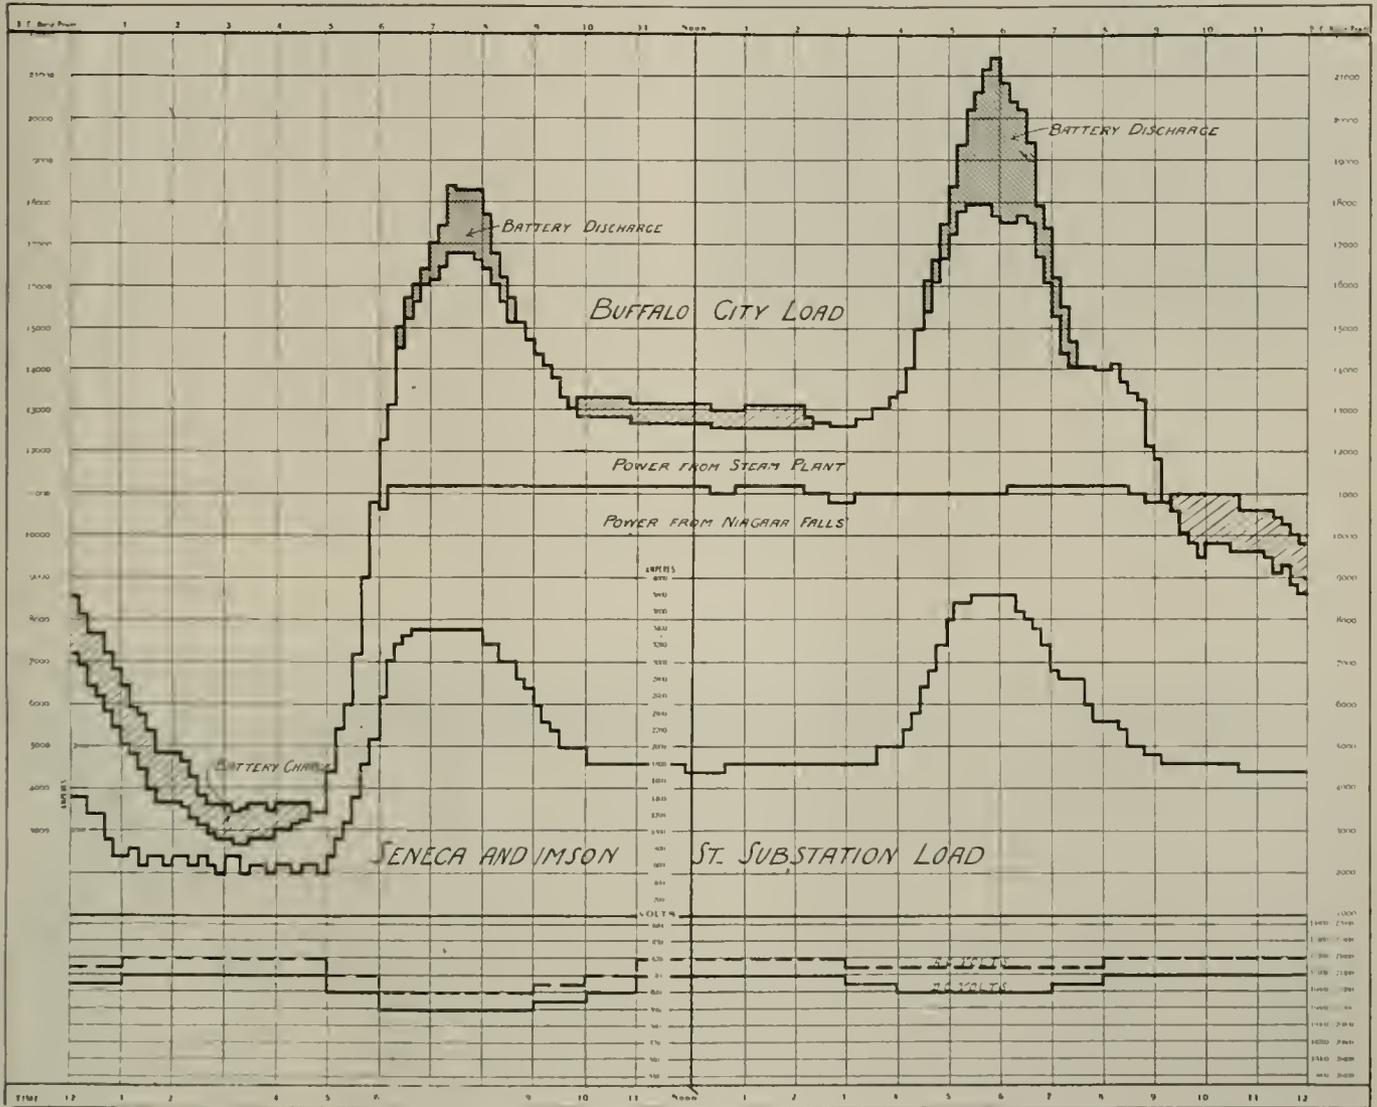

Entrance Details.

The sill of the large entrance door is at the level of the main station floor and a little above the platform height of a wagon, so that apparatus can be conveniently unloaded. To facilitate unloading machinery and bringing it into the station an arrangement is provided by means of which the crane can be used to great advantage. Directly in front of the door, and about fifteen feet from the sill, there is a heavy cast-iron plate secured to the floor framing. This plate has

care of by providing on three sides large windows cut close to the floor and surmounted by transoms, smaller windows near the roof on all four sides, and six 36-inch ventilators in the roof.

Arrangement of Apparatus.

Current enters the 11,000-volt busbars at one side of the building and passes straight across through the successive switches and apparatus to the point where it leaves on the railway feeders at the opposite side of the station. All connections are thus simplified and minimum lengths of cable are required. The direct-current feeders each leave the

International Railway, Buffalo—Power Chart Showing Total City and Combined Seneca and Imson Substation Load-Curves Typical for Winter 1906-1907.

a thick portion which comes flush with the top of the finished floor, and through the thick part there is a vertical hole, or circular eye, three inches in diameter, which passes all the way through the floor. Directly under this eye in the main floor there is a ring-bolt anchored securely in the rock beneath the basement floor. By fastening a chain in the ring-bolt and passing it up through the eye, a snatch-block can be secured at any desired height above the station floor. A cable around the snatch-block with one end attached to the load and the other to the crane-hook can be used to haul the load off the truck and to the station floor, where it can then be picked up by the crane in the usual way. The ring-bolt is set low enough in the basement floor so that it can be covered with a checkered plate flush with the floor.

The ventilation of the whole station has been well taken

building through underground ducts directly in line with the centers of their respective panels. This separates the exposed lengths of cable and gets the feeders into the ducts by the shortest possible route. As shown in the plan view these ducts converge into one large vault under the street.

The apparatus is so placed that there is ample room around each element to perform the usual operations, and the aisles are wide enough so that large, heavy pieces do not have to be raised high with the crane when installing or removing. The fans for cooling the transformers are located close to windows so that outdoor air may be had when necessary.

The 1,000-kilowatt rotary is started on low-voltage taps from the secondary winding of the three-phase transformer,

and the 400-kilowatt rotaries are similarly started but are supplied with power by three single-phase transformers.

Switchboards.

The alternating-current rotary panels contain all the switches to be operated in starting a machine, except the field break-up switch. The overload relay and alternating-current meter are also on this panel, thus simplifying the wiring. These panels are located close to the static trans-

forming out and short-circuiting the secondaries of the current transformers on the dead cables.

The direct-current feeder panels are in the main switchboard and are equipped with potential receptacles connected to the station voltmeter, so that the attendant can determine, if he drops a feeder, whether or not it is alive from another station and what voltage it carries. The circuit-breakers are all wired to sound a gong when they open automatically.

A utility panel is provided in the main switchboard, supporting the ammeter and rheostat controlling the storage battery for operating the oil-switches; also switches and fuses for lighting circuits and the motor-driven air compressor. On the lower section of this panel is a relay which sounds a gong in case any oil-switch opens automatically, and another relay which causes six incandescent lamps on the bottom of the middle roof truss to be instantly illuminated from the oil-switch control battery in a case of a general power interruption which puts out the regular station lights.

Switchboard Details.

The method of leading the wires from the floor ducts to the back of the switchboard panels is rather unusual and is believed to have many advantages over the individual junction boxes, bent tubing in wood sills, etc., that have often been employed. The switchboard panels stand on a wood sill, which in turn rests on two channel-irons on edge with ample space between them for handling and spacing the wires. The conduit projects just through the channels and is capped off flush. Vertical bushings in the wood sills lead the wires from the ducts to the back of the panels. The under side of this opening between the channels can easily be covered with steel plate so as to prevent injury to the wires from below.

The oil-switch control battery is placed in a separate room in the basement. This room is connected by means of

Seneca Street Substation, Buffalo—Exterior View.

formers and rotaries instead of in the main switchboard. The advantages are that the attendant has fewer steps to take in starting a machine, cannot mistake the panel controlling any particular machine in case of trouble and the main switchboard is reduced in length, thereby bringing nearer together the panels with which the attendant is constantly concerned. There are control switches and indi-

International Railway, Buffalo—Virginia Substation with Six 1,000-Kw. Rotaries.

cating bull's eyes for the converter oil-switches on the direct-current rotary panels as well as on the alternating-current panels. These switches on the direct-current panels are only for use in emergency and are arranged so that they will only open the oil-switches.

The incoming power is measured on a single meter, regardless of the number of incoming cables in service. This is accomplished by paralleling the secondaries of the current transformers. Double-throw switches are provided for cut-

a pipe laid in the floor, with the air-chamber under the transformers, and as there are windows in the battery room, the air can be changed at any rate desired. Next to the battery room is the store-room and station-attendants' locker room and opposite these is the toilet room. The whole basement is well ventilated by windows protected on the outside by both screens and bars.

The electrical apparatus was furnished and installed by the General Electric Company, the station arrangement and

design having been worked out by the engineers of the International Railway Company. The equipment and arrangement of the new station are clearly shown in the accompanying engravings from blue-prints and photographs for which, with the above data, we are indebted to G. A. Harvey, electrical engineer International Railway Company.

COMMUNICATION.

A Car Repair Problem.

To the Editors:

The locating of troubles in the electrical equipment of the ordinary street car is not always as simple as might be supposed. The following statement of conditions will illustrate a problem which recently came to my notice. It might be of interest to the shop men who are readers of the Electric Railway Review, and therefore I forward it, trusting that some replies may be received.

The particular car on which the trouble occurred was equipped with four G. E.-80 motors and two K-28 controllers. The electrical equipment was originally placed on the car at the car builder's. When the car was put in service it ran all right for about three months; then it was sent to the repair shop for trouble reported as being in the No. 2 end-controller. On inspection the repair man found a broken pawl spring in the No. 2 controller. This repair was made and the car placed in the hand of the tester, who found that with all four motors the car would run properly from the No. 1 controller both forward and reverse, but on reversing from the No. 2 controller the No. 2 motor would reverse its direction of rotation when the first parallel point was reached. If the No. 1 and No. 3 motors were cut out the car would run forward and reverse properly when operated with the No. 1 controller and would run forward when operated with the No. 2 controller, but when it was attempted to reverse with the No. 2 controller the circuit-breaker would open. Removing the brushes from the No. 4 motor opened the circuit.

SEVENTY-SIX.

INSTRUCTING TRAINMEN AT KNOXVILLE, TENN.

The Knoxville (Tenn.) Railway & Light Company has a novel and satisfactory method of teaching new employes the details of motor construction and car wiring. Each motorman must spend seven days in the repair shops before he is given a regular run. During that time he must apply himself to learning the component parts of motors and on completing this service he able to trace the path of the current from the trolley wheel to the track return. To assist him in this task a large car-wiring diagram is kept for ready reference in a conspicuous place at the shops. In addition to this bulletins are posted which enumerate the component parts of the motors used and furnish descriptions of the course traveled by the current in passing from the trolley wire through the car back to the power house. One of these bulletins is as follows:

"A General Electric motor type—1,000 or 67 consists of, 1 armature, 1 commutator, 1 yoke, 2 brush holders, 2 brushes, 4 pole pieces, 4 fields, 1 gear wheel and 1 pinion.

"A General Electric motor of Type 800 has but 2 fields, and 2 pole pieces, otherwise it is the same as motors of the No. 1000 or 67 types.

Travel of Current.

"The current travels from the trolley wire to the trolley pole, from the trolley pole to the trolley base, from the trolley base to the overhead-switch, from the overhead-switch to the fuse-box, from the fuse-box to the lightning-arrester, from the lightning-arrester to the kicking coil, from the kicking coil to the cable, from the cable to the controller, from the controller to the resistance box, from the resistance box to the motor, from the motor to the rail, from the rail to the power house."

CHICAGO TRACTION ORDINANCES TO BE DECIDED BY VOTERS.

The message of Mayor Dunne vetoing the Chicago City Railway Company and the Chicago Railways Company ordinances was read to the city council of Chicago on February 11, but the aldermen after discussion passed the two measures over the veto. The vote was 57 to 12, or one more in favor of the ordinances than was recorded at the meeting on February 4. The mayor's objections were answered in detail by the aldermen. They pointed out that while the mayor had been in favor of a settlement of the traction problem he was now interposing objections in order to defer action until after the election on April 2. The principal points raised by the mayor and the answers of the aldermen who discussed the message were as follows:

Mayor Dunne.

The ordinances fail to provide practical methods for the acquisition of the systems. At the present time the city is authorized to issue Mueller certificates amounting to \$75,000,000; after deducting commissions these would net \$72,000,000 in cash. The price of the present properties as fixed in the ordinances aggregates \$50,000,000. The cost of rehabilitation will be from \$40,000,000 to \$50,000,000 and may be an unlimited amount, making the total cost to the city at least \$90,000,000 to \$100,000,000. The city will never be in a position to acquire these lines unless supplemental ordinances are passed, authorizing the issue of at least \$100,000,000 certificates. Unless the ordinances limit the cost of rehabilitation at any time to the amount of Mueller certificates authorized to be issued, in my judgment it will be most difficult if not impossible to obtain the passage of such ordinances.

Alderman Foreman.

During the pendency of the negotiations the mayor has known that the price agreed to be paid for the property and the amount shown by the engineers' estimate to be necessary for rehabilitation will exceed the amount of the authorized issue of Mueller certificates and that if the amount required to rehabilitate the properties is expended, it will require another issue of certificates in order to purchase the roads. The price to be paid for the properties is not the price asked by the companies, but is the price placed by the city's own experts, one of whom is the mayor's personal appointee.

If the ordinances become effective and consolidation of the two companies takes place, as is highly probable in view of the statement of John P. Wilson, representing the Chicago City Railway Company, and in view of the fact that the same financial interests dominate and control both companies, the consolidated companies will operate under the ordinance which is more favorable to them. This is the Chicago City Railway ordinance, which, in the event of purchase by the city, requires the payment of all cash, including the total cost of all the properties and rehabilitation. The other ordinance, which in my judgment will not be accepted, requires the payment of all cash except the cost of rehabilitation, which may become a lien subject to which the city may acquire.

We cannot hope with any confidence that a fund will certainly be acquired out of the 55 per cent net receipts which become the property of the city. We view with serious misgivings the assertion of the companies that the net receipts coming to the city will be any substantial part of the gross receipts. You have passed these ordinances without any provision of any character for gross receipts. Not only do the ordinances fail to guarantee to the city an income of any character, but, if the ordinances become effective, approximately \$125,000 which is paid to the city

The one urgent and sovereign need of the city of Chicago is good street railway service, not passable street railway service. The giving of an up-to-date service in this town will not endanger municipal ownership in the slightest degree. If it does, municipal ownership is a pretty sorry thing to be making any claims to our consideration. The installation of the service which is proposed is a matter which rests entirely with the people and if they desire to embark in the ownership and operation of street railways they will have no hesitancy in authorizing the sufficient issue of certificates to consummate it.

The ordinances proceed upon the conditions that the interest return on the investment of the companies shall be limited to 5 per cent of the value of the properties as fixed by the experts plus the new money to be invested in rehabilitation, the latter to be expended under the direct control of the board of supervising engineers and that the city and the companies shall divide the net profits upon the basis of 55 per cent for the city and 45 per cent for the companies. The ordinances provide that two funds, one of 6 per cent and one of 8 per cent, shall be retained, the first for

under existing circumstances will be wiped out.

No licensee company to which the city may give a license may acquire the plants of the present companies unless upon the payment of a 20 per cent bonus above the price the city would have to pay if it acquired the properties for municipal ownership and operation. The reason advanced by the traction companies for insisting upon this premium was that they should be protected against the sand-bagging operations of rival capitalists. The companies absolutely refuse to accept the provision that if a licensee company should offer to the city to accept an ordinance of similar character and give a 4-cent fare, the existing companies should take the money invested in the plant and turn over the properties to a 4-cent fare company.

The city is embarrassed by a provision which permits these companies to charge 10 per cent contractor's profit upon the cost of rehabilitation and at the same time the ordinances permit them to make subcontracts. Under the ordinances the companies are empowered to charge 10 per cent additional on the cost of subcontracts and the profit obtained therefrom.

The agreement between John A. Spoor, Thomas E. Mitten, the City of Chicago and the First Trust and Savings Bank, which purports to remove the obstruction created by the existence of the present General Electric railway ordinance, is not signed by any of the parties.

The amendment providing for the arbitration of disputes between the companies and their employes was voted down.

The ordinances as finally adopted contained some changes from the summary as published in the Electric Railway Review of January 19, 1907. The important changes are as follows:

Referendum.

The ordinances "shall not take effect unless and until a majority of the votes cast upon the following question of public policy at the election to be held in the City of Chicago, on the first Tuesday in April, A. D. 1907, are in the affirmative: 'For the approval of ordinances substantially in the form of the pending ordinances (reported to the City Council of the City of Chicago on January 15, A. D. 1907), authorizing the Chicago Railway Company and the Chicago Railways Company, respectively, to construct, maintain and operate street railways in said city, and providing for the purchase thereof by the said City or its licensee.'

Transfers.

The companies shall exchange transfers with all existing street car lines operating in the city, not heretofore mentioned, under reasonable regulations, and at all points of connection after such time as the franchises of the other lines now operating shall have expired and shall be extended or renewed.

Through Routing.

The purchase or acquisition by the city or its licensee of any street railways shall not affect or impair the obligations regarding transfers and through routes.

the purpose of maintenance, and the second for the purpose of extension and replacement. Whatever remains of these two funds at the termination of the grant goes either to the city or its licensee and never to the companies.

Speculation in Chicago's streets should cease. The city should have no choice as to which profit-making corporation occupies its streets. It must be borne in mind that the demand for 20 per cent bonus is one to protect the companies from other companies which seek to oust them from the streets. They contend, and not without some force, that if the city become a party to such intent, at least they should be compensated for their removal, and that they should not be made the prey of firms of promoters who trade on other people's assets. The suggestion that such a licensee company should give 4-cent fares was met by the companies by the statement that this would be no protection to the companies, but would inure to the benefit of the city. Such a licensee company could not be required to spend any money on subways or underground trolleys, or to make extensions, or to pay the city compensation, or a part of its net profits.

The part of the ordinances relating to contracts, the method of their letting and the percentage of the contractor's profit was one that was properly guarded by Bion J. Arnold, A. B. Du Pont and M. E. Cooley. The price of every article installed by any of the companies must be approved by the board of supervising engineers on which the city has one member, Mr. Arnold.

Alderman Werno.

The contract covering the disposition of the General Electric railway line has been signed and deposited with the comptroller.

The employes have not urged that the ordinances provide for arbitration of disputes between the companies and the employes.

Fares.

The ordinance was amended to include the future limits of the city for one fare.

Chicago Railways Company.

If the property and rights of the Union Traction company are not acquired within 120 days after the passage of the ordinance the company has an additional 90 days in which to secure approval of the plan of reorganization and readjustment. There must be deposited with the Chicago Title & Trust Company as trustee by January 20, 1908, not less than 3,126 shares of stock of the Chicago West Division Railway Company, 1,251 shares of stock of the North Chicago City Railway Company, 29,601 shares of the stock of the North Chicago Street Railroad Company, and 49,946 shares of stock of the West Chicago Street Railroad Company, being a majority in each instance, other than that held by trustees under existing mortgages or trust deeds; also 81,001 shares of the preferred stock of the Chicago Union Traction Company and 133,334 shares of the common, being more than two-thirds of each class. The plan shall not be operative unless the allotment of securities and the other provisions are approved by P. S. Grosscup and John C. Gray. If they fail to agree they shall refer the question in disagreement to a third person to be selected by them. In case they fail to agree on such third person the selection shall be made by George W. Wickersham and Edward B. Burling. The decision of a majority shall then be binding.

General Electric Railway Company.

The representatives of the Chicago City Railway Company agree as a condition of the ordinance to secure to the city of Chicago the power to annul all the rights and franchises of the General Electric Railway Company and to remove its tracks. In accordance with this agreement John A. Spoor and Thomas E. Mitten deposit with the First Trust and Savings Bank as trustee the promissory notes, bonds and certificates of stock of the General Electric Railway. If the ordinance becomes operative these securities shall be held by the trustee until the provisions of the agreement have been carried out. If the ordinance does not take effect on or before July 1, 1907, the securities shall be returned to Mr. Spoor and Mr. Mitten.

The board of election commissioners has heard arguments regarding the legality of the form of the emergency referendum petition, and will probably announce its decision next week. If it is decided that the petition is legal in form, the voters who are attacking it will raise the question that the signatures are not sufficient in number and that some were forged.

In order that there might be no doubt as to its position the Chicago Railways Company, through Henry A. Blair, vice-president, has addressed a letter to Charles Werno, chairman of the local transportation committee of the city council, stating that the company is advised by counsel that the clause providing that the ordinance shall be effective only in the event of a favorable vote at the April election, is legal and valid. "The company," Mr. Blair says, "will not, in any event or under any circumstances, make any claim to the contrary. If the majority of the votes cast shall not be in favor of the ordinance, the company will make no claim that the ordinance is operative and will make no claim to any rights under the ordinance. The company does not desire to undertake the reconstruction of the street railways covered by any ordinance which is disapproved by a majority of the voters of the city who may vote for it. The company is willing to give such other assurances as may be desired by your committee to further protect the city in the matter above referred to." This letter is similar to one that was issued by T. E. Mitten, president of the Chicago City railway, several weeks ago.

Large Power Plant for Inland Empire System.

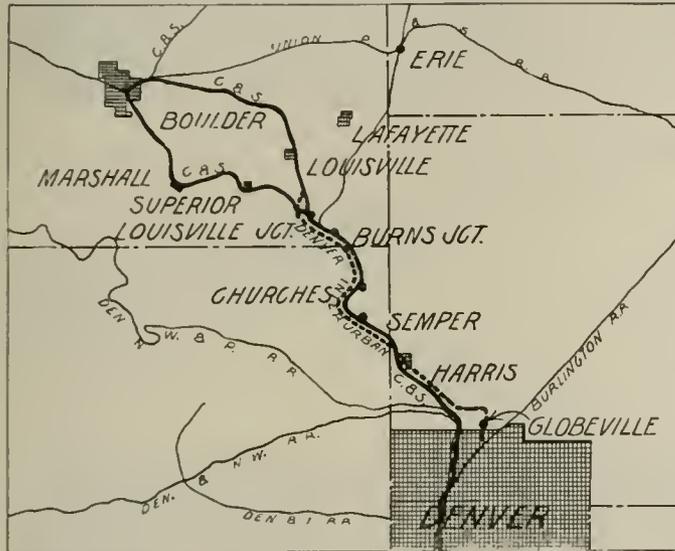

The Spokane & Inland Empire Railroad Company is now engaged on a large water power development at Nine Mile bridge on the Spokane river near Spokane, Wash. The work includes the construction of a masonry dam and power house and the ultimate installation of turbines and generators capable of producing over 20,000 horsepower. The construction is in charge of Mr. F. M. Sylvester, manager for Sanderson & Porter, engineers and contractors, who have the contract for the work.

The new electric railway track laid in Canada in 1906 amounted to 93.32 miles. Of this total 88.42 miles were laid in Toronto, Quebec and British Columbia.

ELECTRIC LINES BETWEEN DENVER AND BOULDER, COLO.

Plans recently have been completed for making possible through electric trains between Denver and Boulder, Colo., a distance of 29.5 miles. United in this work are the Denver City Tramway Company, which will furnish city terminal facilities, the Denver & Interurban Railroad Company, which will build a new line from Globeville just north of Denver to Semper, and the Colorado & Southern Railway Company, which will equip for electric operation its present steam-operated lines between Denver and Boulder, meanwhile building a low-grade freight line to be operated with steam locomotives from Semper to Louisville Junction. It is announced that construction work will begin at once on the Denver & Interurban portion of the undertaking.

The accompanying map shows the location of the smaller towns with respect to Denver and Boulder. It will be noted that at the present time the Colorado & Southern has a steam-operated line comprising a single track from Denver to Louisville Junction, from which point to Boulder there are two operating lines, one by way of Louisville, the

Map Showing New Lines to Be Built and Electrified Between Denver and Boulder, Colo.

other through Marshall. It has been definitely announced that the Denver City tramway will build a new line from Seventeenth street on Arapahoe street to Twenty-Third street, thence along Twenty-Third street and across the Twenty-third street viaduct, which will be rebuilt, thence by private right of way to Washington street and along this street to Globeville at the city limits. From Globeville the Denver & Interurban Company will build a new line to Semper, and from Semper to Louisville Junction the Denver & Interurban cars will operate over the present Colorado & Southern main line, which has a maximum grade of 1.25 per cent. That the trackage facilities may not be limited between Semper and Louisville Junction a new line for the operation of freight trains with steam locomotives will be built with a ruling grade of .8 per cent.

With this new construction there will be afforded two tracks from Denver to Louisville, one to be used by electrically operated cars for passenger traffic and the other for steam-operated freight trains. From Louisville Junction, as has been stated, there are two single-track routes now in operation to Boulder. Advantage will be taken of this so-called "loop" by operating both steam and electric trains from Louisville to Boulder on the northern track and in the opposite direction on the southern track by way of Marshall.

The distance between Denver and Boulder over the new

route will be approximately 30 miles and it is expected to make the run in 52 minutes. The roadbed of the new line will be designed for heavy traffic and the track laid with 80-pound steel rails. The waterways will be crossed with concrete arches. The Denver & Interurban Railroad Company has offices at 809 Cooper building, Denver. Mr. A. D. Parker is president, and Mr. H. W. Cowan chief engineer of this work.

PROPOSED BROOKLYN-MANHATTAN SUBWAY LOOP.

After a long and complicated controversy over the relative merits of a subway and an elevated loop to connect the Manhattan terminals of the Brooklyn, Manhattan and Williamsburg bridges, the Board of Estimate and Apportionment of New York City has approved the plan for a four-track subway loop, and it is now expected that this will be followed by the approval of the appellate division of the supreme court of the state.

Under the rapid transit laws that have been enacted and amended at various times by the legislature of New York for the benefit of New York City, the local authority in the matter of approving routes and granting franchises, which formerly rested with the board of aldermen, is now exercised wholly by the board of estimate and apportionment. The determination of routes and the question of general public policy rest with the board of rapid transit commissioners, which consists of the mayor, comptroller or other chief financial officer, the president of the chamber of commerce of the city and five other persons. The legal course to be followed before new rapid transit facilities are authorized follows: The board of rapid transit commissioners must consider routes and general plans and determine whether the desired rapid transit facilities would be in the public interest; secure the approval of the board of estimate and apportionment; and secure the consent of the owners of the abutting property to the extent of 50 per cent of the assessed value thereof. If the consent of property owners is not obtainable the law provides that the appellate division of the supreme court shall appoint a commission to investigate each proposed route and, upon a favorable report of this commission, the court may authorize the extension. The board must then prepare detailed plans and specifications and advertise for bidders.

The route as designed by the board of estimate and apportionment and shown by the accompanying map begins at the Manhattan end of the Williamsburg bridge and runs through Delancey street and its contemplated extension to Centre street and under Centre street to the Brooklyn bridge terminal at Park Row, with a spur extending under Canal street to the proposed new Manhattan bridge. In Brooklyn the subway extends from the Williamsburg bridge under Broadway to Lafayette avenue and thence under that street back to the extension of the Manhattan bridge approach.

Although the board of rapid transit commissioners has no control over the bridge traffic over the East river, the latter being in the hands of the bridge commission, the former body has taken every step in its power to promote a plan for the early relief of the congested condition of the passenger traffic between Manhattan island and Brooklyn and has anticipated the decision of the appellate division of the supreme court by the preparation of complete plans and specifications for the loop, so that after all legal steps shall have been taken there need be no delay in advertising for bidders and in raising the funds to undertake the work.

The work which will first be undertaken will be the Manhattan portion of the loop connecting the Williamsburg and Brooklyn bridges. The completion of the Brooklyn portion of the loop by means of a line over the Manhattan bridge will await of course the completion of the long delayed work on that structure. Under favorable circumstances the Man-

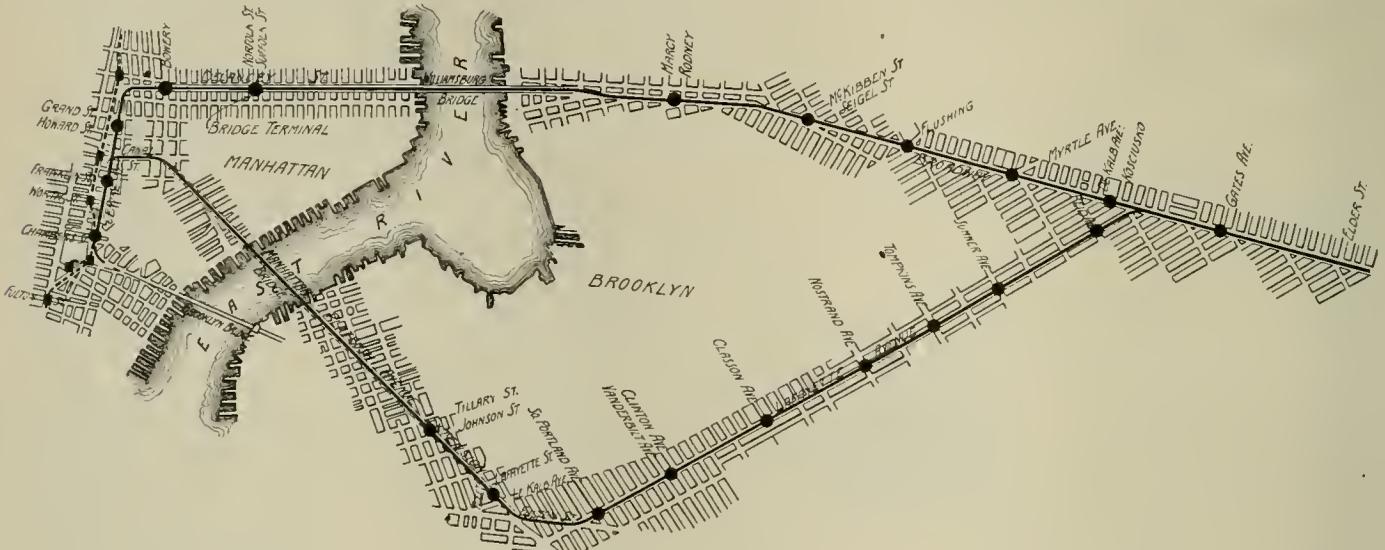

hattan portion of the loop could be in operation within about two and a half years.

The effectiveness of the earliest relief that can be afforded by the construction of the subway loop hinges largely upon the establishment of practicable conditions for the operation of the cars of the Brooklyn Rapid Transit Company around the loop connecting the Williamsburg and Brooklyn bridges.

During the discussion of the relative merits of a subway and elevated loop structure on Manhattan Island this question was an important consideration. The majority of the board of estimate and apportionment favored the subway loop, in order to prevent further disfigurement of the city by an elevated structure, but the Brooklyn Rapid Transit Company contended that from its standpoint a subway loop presented grave operating difficulties, particularly if the board insisted upon the operation of all-steel cars in the subway, and that these difficulties would all be overcome by the building of an elevated structure. It was declared that the section of the city to be traversed is of a character that could not be injured for business purposes by the presence of an elevated structure and that the latter would afford relief in the near future, whereas the subway cannot be built and placed in operation in time to solve the present distress-

Rapid Transit Company is an applicant for the proposed subway loop between the bridges, or at least has signified its willingness to lease and operate it when constructed. This is incorrect. The question of the adaptability of our equipment to such operation, the safety of handling the business under the prescribed conditions, and the possibility of lifting cars up a $5\frac{1}{2}$ -per cent grade at the Park Row end of the Brooklyn bridge without a great expenditure for new types of cars and change of train composition which together with an increased cost of operation would make it impracticable from a financial standpoint—all these will need to have the most careful consideration in the light of further information. The discussion with the committee was on these lines. We are exceedingly desirous of co-operating in any feasible measure, above ground or below, but we cannot do the impossible. I have from the first felt and frankly expressed grave doubt of the feasibility of the Brooklyn Rapid Transit Company operating the subway connection between the bridges on the grades laid down by Mr. Parsons three years ago, which I understand practically control in the present plan, but we will gladly join the committee in the fullest consideration of this or any other proposition, however doubtful the result may now seem to be."

On the Brooklyn side of the Williamsburg bridge no incline will be required, so far as the Brooklyn Rapid Transit cars are concerned, as a cross-over will connect the Williamsburg tracks with the elevated structure of that system in Broadway. There is no question that the proposed loop, if

Route of Proposed Brooklyn-Manhattan Subway Loop.

ing problem of the bridge congestion. The company contended that although enormous sums of money have been expended in improving the company's elevated structures in Brooklyn, the adoption of the heavy steel cars, the use of which in the subway the board of rapid transit commissioners at first proposed to make compulsory, would necessitate a further radical strengthening of the elevated structure in Brooklyn and the expenditure of vast sums for this work and for new cars and auxiliary equipment. As the result of conferences between President E. W. Winter of the Brooklyn Rapid Transit Company and the board of rapid transit commissioners it was decided that the board would not insist upon all-steel cars but that cars similar to the new type of steel-underframe wooden cars, having asbestos floor protection, would be satisfactory. The concession does not relieve the Brooklyn Rapid Transit Company from large expenditures for new equipment and for increased power to operate the loop—expenditures which will be very considerably increased by reason of the $5\frac{1}{2}$ -per cent grades and the very short curves connecting the bridge tracks with the subway. The present position of the Brooklyn Rapid Transit Company in the matter is clearly set forth in the following statement, which has been issued by President Winter:

"Apparently the impression is abroad that the Brooklyn

found practicable, will enable the Brooklyn Rapid Transit Company to operate its cars under a much reduced headway and to care for the bridge traffic with a greater degree of comfort than at present, but it will also involve a complete revision of the company's operating scheme. The ramifications of the company's system will make possible a number of through loop operations and this will involve a freer interchange of cars between the various lines of the system than at present. It will be necessary to work out all the routes on the basis of economical operation. The operation of either elevated or subway loop will add great expense to the Brooklyn Rapid Transit Company. Some 300 new cars will be required and 15,000 kilowatts capacity for additional power, so that the aggregate investment on account of the loop will hardly be less than \$4,500,000, without considering the numerous changes in the elevated structure, which may be necessary in the working out of the new through routes. It is the intention of the Rapid Transit Commission, when the Brooklyn portion of the proposed subway loop is built, that the whole loop will be operated in connection with the present subway system, the Manhattan portion of the loop to the Brooklyn approach of the Williamsburg bridge being used jointly by the subway operating company and the Brooklyn Rapid Transit company.

NEW TYPE OF CAR, UNITED TRACTION COMPANY.

The United Traction Company, Albany, N. Y., has recently placed in service a new type of car which includes several interesting details. The car is of the straight-sided type with vestibuled platforms and a steam-car pattern hood. The principal feature which commends the car to the officials of the traction company is the device for opening and

New Cars for United Traction Company, Albany—Interior View Showing Arrangement of Doors to Form Motorman's Compartment.

closing the doors by the motorman. This mechanism also closes the steps while the car is in motion. It is thought that placing the doors and steps under the control of the motorman will keep the number of accidents to passengers at a minimum. The fact is recognized that nearly all damage suits against street railway companies are caused by injury to passengers while they are getting on or off moving

United Traction Company, who has exercised a general supervision over the construction of the sample car.

The new cars will be run over the Troy division. The general dimensions are as follows: Length of body 28 feet; over platforms 40 feet; over buffers 41 feet 6 inches; width at bottom 8 feet; over drip rails 8 feet 2 inches. The interior finish is cherry; ceilings of bird's eye maple; seats and backs spring cushioned covered with rattan. The glass in the side sash and doors is polished plate, and the deck glass is white-chipped with bevel borders. The car is equipped with a push-button signal bell system, alarm gongs, Consolidated heaters, pantasote curtains, solid polished bronze trimmings and other details. The vestibule platform is on a level with the car floor, the vestibule having a cab for the motorman, who is completely shut off from the platform compartment. A unique feature is the operation of the push-button signal bells, the current being taken from the trolley and the voltage lowered by a diverter. The car is mounted on Brill's No. 27 G. I. trucks, equipped with four G. E. No. 80 motors, and type-M master control.

Suggestion to Prevent Street Crossing Accidents.

A special committee appointed by the Indianapolis Commercial Club to investigate street car accidents has suggested a plan to avoid accidents caused by persons passing from behind one car immediately in front of an approaching car on the opposite track. The plan deemed practical by the committee was the placing of a signal bell on the rear of each car, to be operated by the motorman, when his car is at a standstill and another car is approaching on the opposite track; such signal to be a warning to the pedestrian about to cross from behind a standing car to the track of an approaching car. Robert I. Todd, vice-president and general manager of the Indianapolis Traction & Terminal Company, to whom the plan was presented, said it was impractical, because it depended on a dry battery, the action of which he said was uncertain. Mr. Todd's objections were on the theory

New Cars for United Traction Company, Albany—Exterior View showing Air-Operated doors and steps.

cars. This will be prevented by the new type of car, as a passenger will be unable to get on or off the car until the car comes to a dead stop, when the doors will then be opened by the air mechanism controlled by the motorman.

The trial car operates so satisfactorily that an order for 24 more has been placed with the builders, the J. M. Jones' Sons Company, Watervliet, N. Y. The 24 new cars will be duplicates of the sample car, with some modifications suggested by Edgar S. Fassett, general manager of the

that a bell falling to work at all times might lead the public into danger if depended upon.

The Columbus Railway & Light Company, of Columbus, O., has paid dividends to over 600 of its employees. This is in accordance with a policy adopted several years ago by the company, to pay dividends to its employees at the same rate paid the stockholders, based on the amount of the wages of the employees.

DELLWOOD PARK, CHICAGO & JOLIET ELECTRIC RAILWAY.

The Chicago & Joliet Electric Railway Company, of Joliet, Ill., is now completing in readiness for the summer season what is expected to be one of the finest and most attractive parks owned by interurban railways in the country, both on account of its advantages in the way of natural scenery and from an architectural standpoint. Dellwood Park, as it is called, is located on the main line of the Chicago & Joliet Electric Railway, about four miles north of Joliet and about thirty-five miles southwest of the center of Chicago. The work on the park was begun early in 1906 and it was opened to the public, although in an incomplete state, last season. This year the park is being improved in many ways and new features are being added, including some new buildings. This work is now in progress and is being pushed as rapidly as possible in order to have the park entirely completed by the opening of

Company. From Summit, three miles west of the Forty-eight street terminal, a double-track line extends to Lyons, where connection is made with the cars of the Chicago Union Traction Company connecting with all lines on the west and north sides of Chicago. The distance from Joliet to the Chicago city limits is 30 miles and cars are now operated on an hourly schedule, making the run in 1 hour and 25 minutes. During the summer the headway will be reduced to 30 minutes or possibly 15 minutes and the running time will also be reduced. The run from Joliet to the park is made in 15 minutes and during the park season cars will run every five minutes or oftener if occasion requires. It is expected to attract a large number of visitors to the park from Chicago and to this end it is expected to reduce the round-trip rate to 50 cents. No admission fee to the park will be charged.

The grounds on which the park is located are rectangular in shape, 2,400 feet long by 1,350 feet wide, the long side extending east and west, comprising about 62 acres of land

Dellwood Park—Boathouse and Lower Dam with Passageway Underneath.

the coming season. Although the state of some of the new work is not sufficiently advanced to permit of illustration, the accompanying engravings from photographs, for which we are indebted to the courtesy of Mr. J. R. Blackhall, general manager of the Chicago & Joliet Electric Railway Company, will give an excellent idea of the scope and class of the work and the natural advantages of the location. All of the work is of the most substantial character throughout, and when completed the park will have cost approximately \$250,000.

The Chicago & Joliet Electric Railway Company, which is controlled by the American Railways Company, of Philadelphia, Pa., operates six city lines in Joliet and vicinity and furnishes an entrance to the city over its tracks for the cars of the Joliet Plainfield & Aurora Railroad Company, operating between Aurora and Joliet. The Chicago & Joliet also has a double-track interurban line from Joliet to the city limits of Chicago at Forty-eighth street, whence passengers may continue their journey to the center of the city in the cars of the Archer avenue line of the Chicago City Railway

whose character is admirably suited for park purposes. The ground is mostly hilly and about two-thirds of it is wooded, including 40 varieties of trees, shrubs and plants growing in their natural state. A large number of imported shrubs and plants, as well as native shrubs and trees, have been added during the past season to the already fine collection in the park. A deep ravine extends through the grounds in an easterly and westerly direction, with rock cliffs from 30 to 50 feet high exposed on either side. The difference in elevation between the lowest point in the ravine and the highest point of ground in the park is 82 feet.

The high ground overlooks the valley of the Des Plaines river, with a view to the north and south as far as the eye can reach, taking in the Chicago Drainage Canal and the deep waterway soon to be built from Lake Michigan to a point opposite the park and which is planned to extend to the Gulf of Mexico by way of the Illinois and Mississippi rivers.

Formerly a small stream ran through the ravine, of such insignificant proportions that it was often nearly dry in the

summer. This has been dammed by two reinforced concrete gravity dams to form two lagoons, one with an area of 4.8 acres and the other 3.5 acres, which afford excellent opportunities for boating, bathing and other water sports in the summer and skating in the winter.

Both dams were built by the Ambursen Hydraulic Construction Company, of Boston, Mass. The upper dam is 40

Dellwood Park—Interior of Dancing Pavilion.

feet long by 15 feet high. The lower is 170 feet long by 18 feet high, with an 82-foot spillway. The lower dam, which is illustrated in one of the engravings, is located at one side of the entrance to the grounds and gives a very effective appearance to the first view of the park. This dam is hollow and contains a passageway under the spillway, which is lighted at night.

The walks on both sides of the ravine are connected by means of concrete stairways with promenades extending out over the dam as far as the spillway on each side. At the right of the spillway is a glass cascade 16 feet long by 9 feet high, which is lighted at night by Cooper-Hewitt mercury

Dellwood Park—Band Stand.

lamps. At the other side of the dam is a frame structure 50 by 36 feet, with concrete base, not yet entirely completed, which will be used as a refreshment pavilion and boat-house, and which will be kept open in the winter for the accommodation of skaters.

The ravine is also spanned by two reinforced concrete bridges, which are illustrated, the upper one a single 40-foot elliptical arch, 15 feet above the water, and the other consisting of three 40-foot elliptical arches, 140 feet long, including approaches, and 30 feet above the water. Both bridges were

designed with an eye to beauty and make a very effective appearance.

The finish of the concrete work in the dams and bridges, as well as in other parts of the park, is especially noticeable. Great care has been taken to remove the form-marks and to give a smooth surface. On all plain work the concrete has

Dellwood Park—Three-Span Concrete Bridge.

been rubbed smooth with sandstone. In other places the edges have been rubbed smooth to form a border two or three inches wide and the remainder of the surface has been bush-hammered. In some cases this process has been reversed and the border has been bush-hammered and the rest finished smooth.

A double track branching from the main line of the Chicago & Joliet electric railway enters the park on the north side and forms a loop near the center of the park. This loop contains four tracks where cars may wait in readiness to handle the crowds at the time when most of the park patrons are ready to return home. A concrete plat-

Dellwood Park—View of Scenic Railway.

form 112 feet long by 16 feet wide, covered by a roof supported by a steel frame, is located on this loop. A similar platform is located opposite to the main entrance to the grounds, between the main tracks. A concrete subway leads from the station under the north bound track and the highway into the park, to avoid opportunities for accidents caused by having crowds on the tracks. The entrance to the subway is an inclined plane instead of stairs. There are two outlets from the subway into the park, the most frequented one an incline plane and the other a stairway. From

the subway macadamized walks lead to all parts of the grounds.

All the amusement buildings are located on an avenue 60 feet wide and 650 feet long, starting from the station on the loop. A 50,000-gallon water tank on a steel tower 75 feet high is located in the center of the avenue. A building 50 feet square built around the base forms a refreshment stand. The tower is to be enclosed with metal lath and Portland cement plaster and will be made to represent a lighthouse tower. A 20-foot concrete basin and fountain are located on each side of the tower, each halfway between the tower and the ends of the avenue. Complete water, sewer and gas systems are provided throughout the grounds. An 8-inch water-main extends each way from the tower, supplying all the buildings and fire hydrants located at frequent intervals. The tank will be supplied by an artesian well about 2,000 feet deep that is now being sunk from which water will be pumped into the tank and from there distributed through the system.

The buildings located on the avenue include the scenic railway pavilion, 64 by 33 feet; dancing pavilion, 124 by 74 feet, giving a dance floor 100 by 50 feet and a promenade 12 feet wide on all four sides; the electrical theater, 68 by 36 feet with a seating capacity of 250; a laughing gallery, 36 by 20 feet; and a combination amusement building, 90 by 50 feet, in which will be gathered together the various smaller amusement features, such as the shooting gallery, hall-throwing gallery, penny arcade, cane and knife racks, slot machines, etc. The band stand, and octagonal structure, 25 feet in diameter, with concrete foundations and floor, which will be used for concerts by the Dellwood Park Band, of 30 pieces, is located at one end of the avenue.

Before the opening of the next season a theater, 87 by

the grounds before next season. These will be provided with kitchens and fires for the use of picnic parties.

All of the buildings are of the Spanish mission type of architecture and are substantially built, of frame construction with concrete foundations. The exterior finish is Portland cement plaster and stucco on metal lath. The build-

Dellwood Park—Entrance to Park, Showing Subway.

ings are painted a grayish green. The roofs are covered with red Ludowici interlocking tile.

The scenic railway, which is about 2,000 feet long, starts from the pavilion on the main avenue, winds through the wooded part of the grounds, crosses the ravine over the upper dam, and recrosses over the lower lake, skirting the rock walls of the ravine to a point 200 feet from the starting point,

Dellwood Park—Dancing Pavilion.

146 feet, with a stage 40 by 31 feet and with a seating capacity of 1,200, will be erected on the south side of the avenue opposite to the water tower. A carrousel, a House of Nonsense, and places for one or two other small amusements will also be erected. On the bluff, overlooking the lagoon, a casino, 60 by 100 feet, is to be erected. Here it is proposed to establish a first-class restaurant, where meals of the better quality will be served. Two picnic pavilions, 30 by 65 and 38 by 80 feet, will be erected in different parts of

where the cars are carried up an incline by an endless-chain hoist to the station. The scenery along the railway is all natural.

A tract of 16 acres, at the upper end, including the upper lake, is fenced off from the other part of the grounds and reserved for private picnic parties and for the use of the Joliet Chautauqua Association, which meets for two weeks in July. A steel auditorium building with a seating capacity of 3,500, and equipped with a stage and dressing rooms, is

located in this reservation, for the use of the Chautauqua Association and for concerts, conventions, etc. This auditorium has the shape of a 20-sided polygon, 150 feet in extreme diameter. The umbrella type roof is sustained by steel trusses supported by a center column.

Just north of the Chautauqua grounds is an athletic field

Dellwood Park—Single-Span Concrete Bridge.

containing 5 acres, enclosed by a high board fence. This field is provided with a baseball diamond, a quarter-mile cinder track, a steel frame grandstand seating 1,000 people and bleachers seating 500. Baseball games are held here two or three times a week during the season.

A macadamized driveway for vehicles leads from the highway at the entrance to the park to a court between the

park near the entrance, where the current for the "Magnetite" lamps is converted from alternating to direct current by General Electric mercury arc rectifiers. The substation building is 15 by 20 feet, of buff pressed brick, with concrete floor and a tile roof.

The buildings are all lighted with incandescent lamps, with the exception of the dancing pavilion and the auditorium, which are lighted by four-glower Nernst lamps, and the outside of the buildings, including the water tower, are decorated with incandescent lamps.

An illuminated electric fountain with color-changing effects is located on an island in the lower lake. Another small fountain, with a 15-foot basin, is located in the walk leading from the subway.

A one-and-a-half story frame cottage is now under construction for the use of the head gardener, who will be permanently located in the park.

The entire park is fenced with 72-inch Ellwood woven wire fencing on reinforced concrete posts, with three barbed wires strung above the top in a triangle and fastened to galvanized iron crests cast in the posts. About 1,500 concrete posts were required for the fencing.

The park is being built by the Dellwood Park Company, Incorporated, a subsidiary company of the Chicago & Joliet Electric Railway Company and managed by the same officers.

Improperly Mixed Varnish.

In a recent lecture before the New York Railroad Club Mr. William Marshall presented some interesting facts regarding the history and use of varnish. The explanation of the fact that most cars look dull or "all gone in" in such a short time is found in the common practice of mixing the

Dellwood Park—Steel Auditorium in Chautauqua Grounds.

loop and the athletic field, with an entrance to the Chautauqua grounds.

The grounds are lighted by 80 General Electric "Magnetite" luminous arc lamps, 22 four-glower Nernst lamps, 35 two-glower Nernst lamps and a large number of incandescent lamps. Power for lighting, in the form of three-phase 60-cycle current at 2,300 volts pressure, is supplied from the plant of the Economy Light & Power Company at Joliet. The lighting is all controlled from a substation located in the

color coats with too little linseed oil so that they will dry rapidly. The result of this is that the pigment, which has a large oil-carrying capacity, absorbs the oil from the varnish coat. This consequently loses its life and luster. The claim was made that too little time is allowed for varnishing cars, and the use of too much "dryer" and too little oil to hold the pigment. The remedy suggested was to allow sufficient time for painting and varnishing and to use plenty of oil in the color coats.

SINGLE-PHASE LINES OF THE ILLINOIS TRACTION SYSTEM.*

BY H. C. HOAGLAND, ELECTRICAL AND MECHANICAL ENGINEER.

It is the purpose of this paper to present some of the features of the single-phase railway system now being built by the Illinois Traction System.

A new power house is now being built at Peoria, Ill., to furnish power for this system, as well as the local street railway. The plant consists of eight 400-hp. Stirling water-tube boilers, designed for a working pressure of 200 pounds. These boilers will be fired by Green automatic stokers, and coal will be fed automatically. In the generator room will be installed: Two 2,000-kw., 2,300-volt, Curtis steam turbines, two 750-kw. rotary converters, one 75-kw. turbo-exciter set, and one 70-kw. motor-generator set, together with a switchboard and the other necessary apparatus.

The turbines will generate 25-cycle current at 2,300 volts, which will be stepped up by six 700-kw. Westinghouse, water-cooled transformers, to 33,000 volts. The current will be delivered to the transmission line at this voltage.

Transmission Line.

The first transmission line and two substations are being built on the Peoria Bloomington & Champaign line, to Bloomington. In the substations the pressure will be stepped down from 33,000 to 3,300 volts, which will be used on the trolley. It is the intention to connect the Springfield & Northeastern line from Springfield to Mackinaw, to this line; also the Chicago Bloomington & Decatur line, from Bloomington to Decatur; and balance the three phases of the transmission line by feeding one of these roads from each phase. The transmission line will be connected through an automatic oil switch to busbars in a substation at Decatur. The line from the present Riverton power house will also be connected in the same way, and the two power houses will be operated in multiple. From these busbars, a line will be run to Champaign along the St. Louis Decatur & Champaign Railway and at Champaign the 15,000-volt transmission line—which now furnishes power to the Danville Urbana & Champaign Railway from Champaign to Danville, Georgetown and Ridge Farm—will be connected through three 400-kw. step-down transformers, making the transmission line from Peoria to Georgetown, about 175 miles long.

There will be installed at the Danville power house this summer, a 2,000-kw. generator, direct connected to a pair of 36x60-inch twin engines, which will also feed this transmission line when needed. The substation will be provided with oil-break switches to sectionalize the line and by the use of double-throw disconnecting switches, the transformers can be connected to the live side of the line and the service will not be interrupted while repairs on the transmission line are being made.

Car Equipment.

The Illinois Traction System will soon have in operation 125 miles of track equipped for single-phase operation. The apparatus for which is being furnished by the General Electric Company.

Four-motor, 75-hp., single-phase equipments with multiple-unit train control will be used. The motors will be the GE A-605 compensated type, designed to operate on both high-tension alternating-current and 600-volt direct current.

The armature of the motor has a commutator and is very similar in construction and appearance to the standard direct-current railway motor. It has a series drum winding with three coils per slot and is wound for a maximum of 250 volts. It can be removed from the field frame by removing one of the field heads. The field structure is quite different, however, from that of the direct-current motor, as there are no inwardly projecting poles, and the entire field winding can be removed and readily replaced by a duplicate set of windings, should an accident result in their being damaged. There are two outer steel castings bolted together. These hold the interior field ring rigidly in position to form the magnetic field. This inner portion is built of laminations insulated from one another by japan and securely bolted together by long through bolts. The punchings are shaped so as to form four poles which are slotted for the reception of the compensating field windings.

The field windings are in two sections, the "compensating winding" and the "exciting winding." The function of the latter is to excite the fields, and that of the former to counteract the armature inductance and thus provide a relatively high power factor throughout the range of alternating current operation, and further to improve the commutation

on both alternating and direct-current operation by compensating the armature reaction, thereby reducing the field distortion. The two sets of windings are separate. The field coils are connected in such a manner as to reduce the self induction at high currents, and to permit the motors to be run two in series when operating on standard 600-volt circuits. The compensated windings are connected in series with the armature and field.

Control.

The alternating-current direct-current multiple-unit system of control is similar to the well known type-M control for direct-current operation. To adapt this system for both alternating and direct-current operation, changes are made in the circuit of the contactor coils when the car passes from an alternating to a direct current section, and vice-versa. The motor fields are also connected in series for the direct-current operation and in parallel for alternating current. These changes are made by a special switch called a commutating switch, as the car passes a short dead section separating the alternating and direct-current portions of the trolley line. At the same time, either the resistance or compensator leads are put in circuit for direct or alternating-current operation, respectively.

Direct current operation is exactly similar to that employed on ordinary direct-current equipments. For alternating current operation "potential control" is used; that is, acceleration is obtained by increasing the potential at the motor terminals by connecting compensator taps of successively increasing voltage to the motors in proper sequence, until, when on the last tap, the motors are connected to the full working voltage. The compensator is of the oil-cooled type, suitably designed for suspending underneath the car body and the end castings are provided with stuffing boxes to prevent any leakage of oil where the taps enter.

Protective Devices.

On our cars, both pantagraph and trolley current collectors will be used. For protecting the car equipment against heavy overloads and short circuits that may occur at times, due to unavoidable circumstances, there is placed in the high-tension circuit, between the trolley and the compensator, an oil switch, which is electrically operated and held closed by a small energized coil. This switch is also protected by an expulsion fuse.

For direct current operation, the apparatus is protected by a main direct-current switch. Both the alternating and direct-current circuits are also protected by suitable lightning arresters.

The change from alternating to direct-current operation is accomplished at a dead section in the trolley wire as previously stated. At the instant the car enters this dead section whichever main switch is closed, will open automatically owing to the fact that the circuit energizing its retaining coil is broken. The car can run over this dead section at full speed and all the motorman has to do to obtain the proper connections, is to throw the commutating switch and close the main alternating or direct-current switch, as the case may be, which can be done in the fraction of a minute.

The alternating current passenger cars for the Illinois Traction System are of the standard interurban type, 51 feet 6 inches long over all, having a seating capacity of 58 passengers, and weigh, loaded and completely equipped, about 40 tons. They are geared to a speed of approximately 50 miles per hour on level tangent track. We will also have in operation several electric locomotives, weighing about 60 tons for freight service, which will be equipped with single-phase motors of the same type as described, but of larger capacity.

Cost.

The following table gives an estimated comparative cost per mile of single track road for alternating current and direct current systems, based on the average operating conditions for interurban roads. It is assumed the cars will be 50 to 55 feet over all; equipped with four 75-hp. motors; weighing, loaded and equipped, 40 to 42 tons; geared to a maximum speed of about 45 miles per hour and making a schedule speed of 30 miles per hour with an average of one stop every two miles:

	Distance between substations	Total cost per mile
600-volt DC trolley.....	10 miles	\$24,354
600-volt third rail.....	13 miles	25,908
3300-volt AC trolley.....	17 miles	20,915
6500-volt AC trolley.....	45 miles	20,498

The cost of road bed and track included in the above figures is the same for each system, viz.:—\$13,300. The table has been made on the basis of unit lengths and the figures are only approximate consequently when applied to

*Abstract of paper read before the Illinois Society of Civil Engineers, Peoria, Ill., Jan. 23, 1907.

out the "car report" here shown. On this an exact record of the condition of the car when it left the barn is made, together with the trouble or defect to be repaired. The barn foreman then enters the defects reported on the double car tag which is tied to the controller handle, and left there until repairs have been made and inspected by the foreman.

Upon completion of the repairs the workmen fill out the second half of the tag, which is then signed by the foreman, who sends it to the master mechanic with his personal report written on the back of the original car report.

These tags and car reports are filed for future reference and have been found very satisfactory.

FIFTY-TON LOCOMOTIVE, KANSAS CITY & WESTPORT BELT RAILWAY.

The American Locomotive Company, in conjunction with the General Electric Company, has recently completed a 50-

base of 6 feet 6 inches. Each truck is equipped with two General Electric type 55-H direct-current motors. The motors are inside hung, half the weight being carried on the axle and half by nose suspension from the truck frame. The rated maximum tractive effort is 16,400 pounds. When exerting its rated drawbar pull, the motors will use a current of 160 amperes per motor and will operate a train of 320 tons on a 2 per cent grade, at approximately 8 miles per hour. With a current of 215 amperes per motor, the locomotive will exert a maximum instantaneous effort for starting purposes of 25,000 pounds. The same weight of train will be hauled on the level at a speed of 13 miles per hour.

The locomotive is provided with type-M single-unit control, with five steps in series and five in parallel. It is equipped with General Electric combined automatic and straight airbrakes, fed by one centrifugal pump air compressor, with a piston displacement of 50 cubic feet per minute when delivering at a pressure of 90 pounds. It is fitted with one U. S. trolley, suitable for collecting current at a pressure of 500 volts. The frame is of 10-inch channels with cast-iron humpers and floor plates of 3/8-inch steel. The cab is of the steeple type with one motorman's and two auxiliary compartments. Some of the principal dimensions are as follows:

- Length over all.....31 feet 1 inch
- Height over cab11 feet 9 inches
- Width over all9 feet 6 1/2 inches
- Total wheel-base22 feet
- Rigid wheel-base6 feet 6 inches
- Driving wheels36 inches in diameter

Municipal Ownership and Monopoly.

A real result of municipal ownership is afforded by the city of Lansing, Mich. It is the owner of an electric plant furnishing light and power to its citizens. A new corporation having developed a hydro-electric plant adjacent to the city and being in the way of furnishing electric power to the citizens in competition with the municipal plant, it is proposed to enjoin the service of the newcomer and thereby exclude the competition. This is, of course, in the interest of the financial well-being of the municipal plant, but what does

Fifty-Ton Electric Locomotive for the Kansas City & Westport Belt Railway.

ton electric locomotive for the Kansas City & Westport Belt Railway. The locomotive is designed for freight service and is carried on two 4-wheel motor trucks of the equalized type, with a total wheel base of 22 feet, and a rigid wheel

it argue to the consumer? Simply this, that he cannot avail himself of new and modern developments which reduce costs so long as a monopoly is necessary for the municipal plant to make it pay.—Finance.

PIPING AND POWER STATION SYSTEMS—XXIX.

BY W. I. MORRIS, M. E.

If the waterway is of large dimensions and conditions permit, it should be constructed of concrete; this is the best material which can be used and it is probably the cheapest. The shape and method of constructing a concrete pipe will be governed by the condition of the soil through which it is run. If the waterway is cut through shale or rock, vertical sides and a flat bottom will be found the most economical form to construct. Such a conduit is shown in Figure 245-(11-7). There is no object in using rounded sides or bottom where the banks are fully able to support the weight on them without exerting a lateral strain on the walls. If the banks at the points, a-a, are secure and will permit the concrete being rammed hard, the top may be constructed as an arch. But if the banks are weak, there is no object in making the top arched, as it would not have a solid skew-back to resist the thrust. In this case it would be safer and require less material to build a flat top and use metal rods at the lower portion of the top, thus reinforcing the concrete. If the banks are of loose sand, similar to quicksand, then an egg-shaped conduit should be used; in clay, it would be possible to build

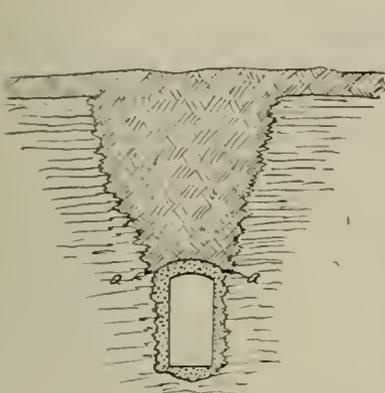

Figure 245-(11-7).

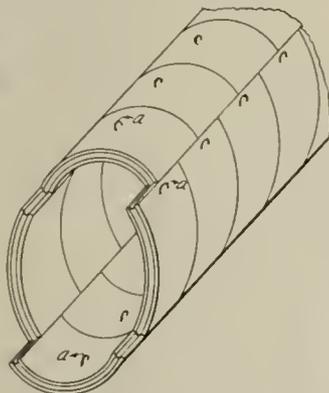

Figure 246-(11-8).

the waterway of hard brick and require very little forming, the bottom being used as a form to lay the brick.

In whatever form the waterway is constructed it should be so graded in regard to low water and have such a height that a man could walk through it when the water is low. For instance, if the bottom of the waterway is 3 feet below low water it should not be less than 5 feet high in the clear, allowing 2 feet above the water for a man to breathe while cleaning the bottom. The wells which run down to the intake should not be over 150 feet apart, as the air in the waterway would become stifling if the distance between the manholes is greater than this. The waterway, as stated, may collect sand, etc., and when the water is high and the conduit is full of water a man could not get in to clean it out. This would not cause trouble as there would be plenty of water available even though there were 2 or 3 feet of sand on the bottom. The trouble would arise only at times when the water level would be low, in which case, however, it could be easily remedied.

Instead of using forms in the trench for building the concrete walls they can be built on the surface of the ground, in a wooden mold, using light wire mesh for reinforcement. This will permit the use of very light concrete walls, possibly 6 inches for a 3 by 5-foot conduit, which could be assembled as shown in Figure 246-(11-8). Two patterns only are required for the molds and all the concrete blocks can be made and be ready for use when the trench is opened. By this method of construction the trench would be open only a short time and many of the difficulties occurring from caving-in would be avoided. Another advantage of this form of

conduit would be that the blocks could be laid in water without injuring the concrete. The loops shown at a should be of heavy wire or rods built into the blocks to facilitate handling them with a crane. Tongue and grooved joints should be used in this construction. The lifting eyes, a, in the bottom slabs may be cut off after they are in place or recessed below the surface. With this construction only a small amount of labor would be required for assembling, as the

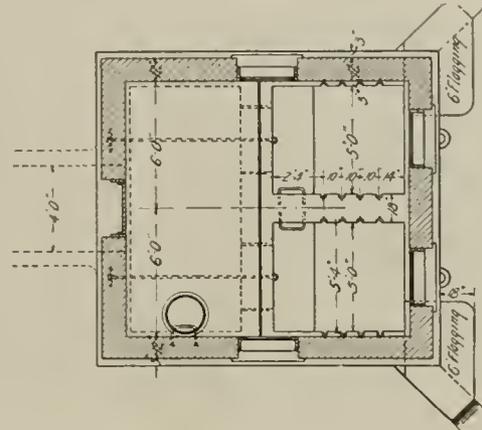

Figure 247-(11-9).

sections could be formed by common laborers. The sections should be put together with cement in the joints and made as tight as tile pipe which would be quite sufficient for this class of work. The weight of these sections,—4 feet by 4 feet by 6 inches, taken at 140 pounds per cubic foot—would be 1,120 pounds, which could easily be handled by a crane.

Whatever the construction of the intake may be it is necessary to guard the mouth so as to prevent the entrance of leaves, sticks, fish, ice, logs, etc. If the water supply is liable to freeze around the intake to such an extent that the supply might be endangered, a line with a regulating valve in it should be run from the condenser discharge so that

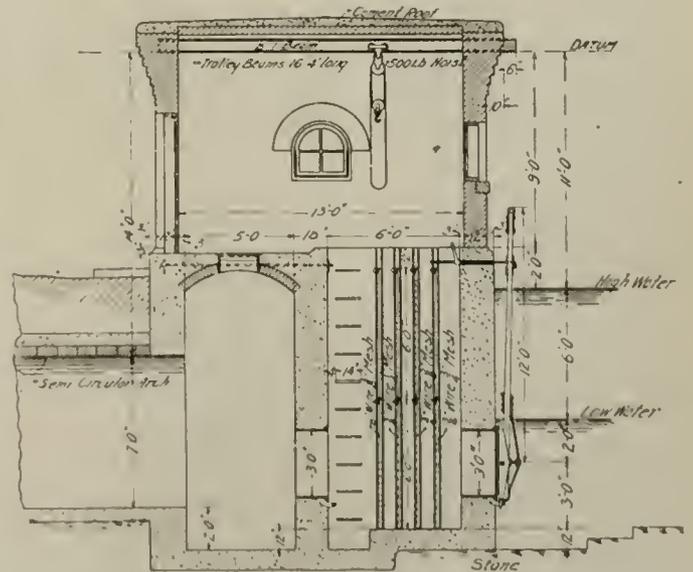

Figure 248-(11-10).

warm water can be delivered at the intake and freezing thus be prevented. The intakes should be fitted with screens of different mesh, arranged so that they can easily be removed for cleaning.

The accompanying figures show a screen house designed by the writer. Figure 247-(11-9) is the plan view showing the double-screen compartment with a 3-foot opening into

and out of each compartment. All four of these openings are arranged for the valve shown in Figure 250-(11-12) which permits shutting off either of the screen compartments without interfering with the operation of the plant. There are two valves for this screen-house. By placing them on the outside of the opening as shown in elevation, Figure 249-(11-11), it is possible to shut off all the openings. The section shown in Figure 248-(11-10) shows one of these

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

NOT REQUIRED BY ORDINANCE TO STOP CARS BETWEEN TRACKS OF TWO RAILROADS BEFORE CROSSING SAME. *Bartholomaeus v. Milwaukee Electric Railway & Light Co.* (Wis.), 109 N. W. Rep. 143. Oct. 9, 1906.

A city ordinance required that before crossing a railroad crossing an electric car should be stopped at least 20 feet from same and that the conductor should pass in front of the car a sufficient distance to enable him to ascertain whether there was any danger in sight. The supreme court of Wisconsin holds that under this ordinance where an electric railway crossed two steam railroads diagonally, the distance between the main tracks of the two being about 85 feet, the electric railway company was not required to bring its cars to a standstill between the tracks of the two railroads before crossing the last one. It says that an attempt to stop cars in such a situation would increase the danger of collision instead of diminishing it, and render the ordinance unreasonable in its operation.

LIABILITY FOR INJURY CAUSED BY FLASH FROM CONTROLLER. *Gilmore v. Milford & Uxbridge Street Railway Co.* (Mass.), 78 N. E. Rep. 744. Oct. 16, 1906.

The defendant's contention here implied, the supreme judicial court of Massachusetts says, that it was not liable for an injury caused by a flash from the controller which could not be prevented by any means that have yet been devised or any care that could be exercised. The court doubts the correctness of that proposition. It would seem that if the company sees fit to use a force which is so imperfectly understood that no method has yet been devised for preventing a flash from the controller, the company and not the passenger should bear the risks arising from its use. But however that may be, there was testimony here tending to show that what occurred was much more than an ordinary flash from the controller, and it was for the jury to say what the nature of the occurrence was. It was also clearly for the jury to determine what weight was to be given evidence introduced by the defendant tending to show that it exercised proper care and diligence in inspecting the controller

NOT LIABLE FOR SHOOTING OF PASSENGER ON FOURTH OF JULY. *Ormandroyd v. Fitchburg & Leominster Street Railroad Co.* (Mass.), 78 N. E. Rep. 739. Oct. 16, 1906.

A Fourth of July celebrator had a cannon loaded with blank cartridges in his yard, quite a distance from the street, sending out "a jet of flame and a volume of smoke as far as the sidewalk," several feet short of the defendant's car tracks. At about half past five in the afternoon, the plaintiff, a passenger on one of its cars, was injured by being struck by some of the wadding of the cannon. The supreme judicial court of Massachusetts holds that the evidence did not warrant a finding of negligence on the part of the defendant. It says that the defendant had no reason to anticipate any danger to its passengers from such a source. Nor was it bound to stop its car and investigate for the purpose of seeing whether the cannon was properly loaded or pointed. The firing had been going on all day and, in the absence of any indication to the contrary, the defendant had the right to assume that it was not a hostile demonstration against the travelers upon the highway, but was a simple ebullition of patriotic emotion, and as such was harmless. To require a street railway corporation to have a general oversight of the details of such exhibitions along the line of the highway on the anniversary of the Declaration of Independence, and to hold it responsible for the consequences to its passengers of any neglect of the exhibitors, would be unreasonable. Such care would be inconsistent with the proper transaction of the business. It might keep the passengers safe but the cars

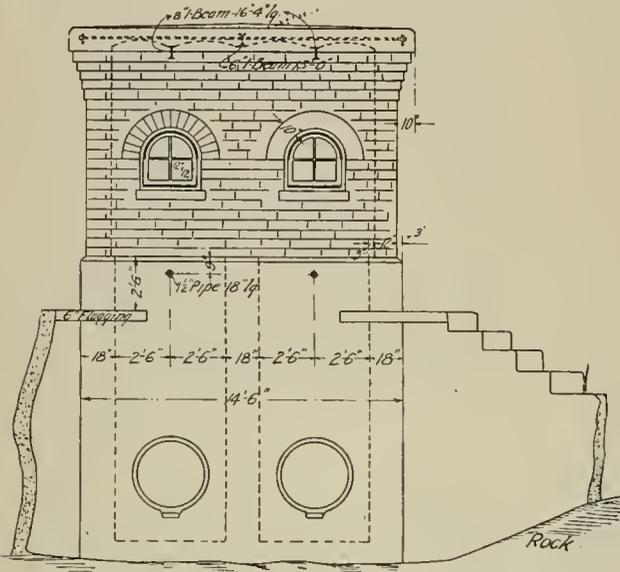

Figure 249-(11-11).

valves in place. The valves, when not in use, are under cover and by keeping them well painted they are always in condition ready for use. The lower end of the long lever has a wrought-iron piece which forms a pivot upon a heavy "scrub-brush handle" cast on the iron casing-ring. The upper end and also the lower portion, just above the valve are each provided with an eye to facilitate raising the valve out of the water; the end of the trolley-beam is extended outside of the building for this purpose.

The valve shown is made of wood of double thickness with well leaded joints and a soft sponge-rubber ring 1-inch square in section fitted around the space at the edge to make a water-tight joint. The screw-rod which extends through the wall and handle-nut are provided to draw the lever up

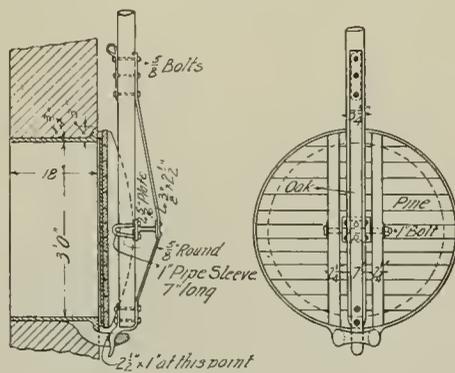

Figure 250-(11-12).

tight against the valve and force the valve against its seat. The adjusting screw is located inside of the building so that it is out of reach of meddlers. The flagging shown in Figures 247 and 249 permits a man to get out of the front of the screen-house and for attaching a small chain hoist to the end of the trolley-beam. An 8-inch I-beam is used; not on account of the weight that it is required to carry is it so great but in order to provide room for trolley wheels of ample size.

(To be continued.)

would practically be at a standstill most of the time and their proper efficiency would be greatly impaired. The case widely differs from those cases where the railway corporation has reason to anticipate danger from a crowd of rioters or other outside parties or causes.

DETERIORATION IN MECHANICAL CONTRIVANCES—PROOF OF INJURY FROM CATCHING HEEL ON METAL PROJECTING FROM STEP OF CAR MAKES PRIMA FACIE CASE.

Rattan v. Central Electric Railway Co. (Mo. App.), 96 S. W. Rep. 735. Oct. 1, 1906.

All mechanical contrivances, the Kansas City court of appeals takes it for granted, as a general rule, are liable to change and deterioration from use. And it thinks it possible that the lead in the metal frame of a "safety tread" fastened to the top of the wooden step of a car had become worn or displaced so as to have left the thin edge of the plate extending above the surface in its worn state; that thus exposed it would become broken, and in that condition have caught and held the heel of the plaintiff's shoe as claimed by her. The point that there was no evidence that the defendant knew, or could have known, of any defect in the step of the car, or had time to remedy the same, the court holds, was not well taken. The plaintiff made out a prima facie case without any direct proof of actionable negligence in that respect. "Res ipsa loquitur" (the matter speaks for itself).

LOCATION OF POLE IN UNDESIGNATED AND UNAUTHORIZED PLACE IS A TRESPASS AND THE OWNER OF THE FEE MAY HAVE RELIEF BY ACTION OF EJECTMENT.

Moore et al. v. Camden & Trenton Railway Co. (N. J.), 64 Atl. Rep. 116. June 18, 1906.

When a trolley company has laid down its railway in the streets of a city, and has obtained by petition from the governing body an ordinance granting such a right and fixing the route of the road and the places where the poles are to be located according to a map accompanying said petition, pursuant to the street railway act of April 21, 1896, the court of errors and appeals of New Jersey holds that it cannot afterwards lawfully place or erect its poles at places in the street different from those so designated. If it locate one of its said poles in the street at a place upon land not thus fixed and designated, and without the authority of the owner of the fee thereof, it becomes a trespasser, and the owner may have relief by an action of ejectment to recover possession of the land thus occupied by the pole, such possession to be afterwards held subject to the public easement.

NOT RESPONSIBLE FOR SAFETY OF STREET OR BOUND TO NOTIFY PASSENGERS OF GUTTER.

Thompson v. Gardner Westminster & Fitchburg Street Railway Co. (Mass.), 78 N. E. Rep. 854. Oct. 17, 1906.

A passenger alighting from a car at about 8 o'clock in the evening of August 16 was injured by stepping into a gutter. The track ran by the side of the road, and between the track and the sidewalk there was a gutter in the form of a ditch 1 foot wide and 1 foot deep, the nearest line of the ditch being 2½ feet from the nearest rail of the track. The supreme judicial court of Massachusetts, in overruling exceptions to a verdict directed in favor of the defendant, says that the place where the car stopped was a part of the highway over which the defendant had no control. "The street is in no sense a passenger station for the safety of which a street railway company is responsible." The plaintiff's contention that it was the duty of the conductor to caution her against stepping into the gutter, and that his failure to do so was negligence, was untenable. Gutters like the one described are not uncommon features of streets in our country towns. They are generally between that part of

the highway which is wrought for public travel and the sidewalk. The plaintiff knew that she was alighting from the car upon the sidewalk side, and the conductor may well have assumed that she was familiar with the existence of gutters and would govern herself accordingly. His failure to warn her was not negligence.

WHETHER PASSENGER WAS THROWN FROM CAR AT CURVE IN OPPOSITION TO CENTRIFUGAL FORCE QUESTION FOR JURY.

Duquis v. Saginaw Valley Traction Co. (Mich.), 109 N. W. Rep. 413. Oct. 29, 1906.

This case is without a parallel in cases of negligence, according to the statement of Mr. Justice Grant, of the supreme court of Michigan, in a concurring opinion, it appearing to be in conflict with the law of centrifugal force. But under the testimony of the plaintiff and his witnesses, if the jury believed them, he was somehow thrown from the car at a curve, although the defendant contended that it was a physical impossibility as claimed, suggesting that the man himself stepped off the car, and it is held that there was a disputed issue of fact which it would have been error to refuse to submit to the jury, unless the court is to substitute its judgment upon questions of fact for that of the jury.

NO ACTIONABLE BREACH OF CONTRACT OR ROUTING ORDINANCE IN ASKING PASSENGER TO CHANGE TO IMMEDIATELY FOLLOWING CAR TO RESTORE SCHEDULE—DIVERSION OF CAR.

Dryden v. St. Louis Traction Co. (Mo. App.), 96 S. W. Rep. 1044. Oct. 16, 1906.

A passenger intending to go to the terminus of the route of the car which he was on was notified on the way by the conductor that the car would not go to the usual terminus, and to take a car following in close proximity. But he refused to change cars, and subsequently sought to recover damages. The evidence on the part of the defendant showed that there had been a delay of 15 minutes, caused by a "jammed switch," resulting in a blockade and disarrangement of the spacing of the cars on the line. The superintendent testified that in order to restore the proper spacing of the cars, and to make up the time lost by the car in question he ordered the conductor to make the loop at a different point from the terminus stated.

That there was no substantial breach of the defendant's contract to carry the plaintiff to his destination, the St. Louis court of appeals says it thinks was clearly shown by the plaintiff's own evidence. He was offered a transfer to another car (at hand) to carry him to his destination, four blocks north of where he was. The mere inconvenience to the plaintiff of getting off one car to take passage on another to be carried immediately to his destination was not an actionable breach of the defendant's contract to carry him.

Nor was he given a right of action by a city ordinance which legalized the company's routing as it existed on a certain date, and which provided that no change of the routing should be thereafter made without the sanction in writing of the mayor, president of council, and supervisor of street railways, and provided, in effect, that a car should not be turned from its established routing, except in cases of unavoidable accident, or when it was about to be turned in according to schedule at a car shed. The ordinance did not attempt to take away from the company its lawful right to make all reasonable rules and regulations for the conducting of its business, nor to specialize all and every circumstance under which a car might be temporarily turned from its regular route. The court thinks that was not only a reasonable diversion, but a necessary one, for the accommodation of the traveling public, and was in no sense a violation of the letter or spirit of the ordinance, and hence afforded the plaintiff no right of action.

News of the Week

Progress of Hudson River Tunnels.

Chief Engineer Charles M. Jacobs, of the Hudson & Manhattan Railroad, which is building the so-called McAdoo tunnels under the Hudson river from Hoboken and Jersey City to Manhattan island, last week gave out some figures showing the progress being made on the work. The two tubes between Hoboken and Morton street are completed under the river, and on the Hoboken side \$34 feet of one approach and 923 feet of the other approach are dug. On the New York side the land tunnel, westbound, has been completed 1,400 feet, almost to a point under Jefferson Market, and the eastbound subway is dug, also through Christopher street, 2,100 feet, to and up Sixth avenue as far as Tenth street.

Of the two downtown tunnels, extending from Cortlandt street, New York, to a point under the Pennsylvania terminal, Jersey City, both are about three-fifths completed under the river, the north or westbound tube having come out 3,120 feet from the Jersey shore, and the south tube having been driven 3,218 feet toward New York.

At Jersey City the two tubes that are to connect the McAdoo terminal under the Pennsylvania station with the Erie and Lackawanna terminals have been dug from the Pennsylvania terminal about half-way up to the Erie terminal; from the Hoboken end of the Christopher-Morton tubes terminal shaft at Fifteenth street about half-way down to the Erie terminal, and from the Fifteenth street shaft up to within two blocks of the Lackawanna terminal. West of the Pennsylvania terminal the four main-line connecting tunnels that go to Newark have been dug to Grove street. Nearly 5,000 feet of the tunnels on the Jersey side are dug. The terminal stations are well under way. The tunnels under the Hudson are to be in operation, it is promised, by September, 1907.

Legislation Affecting Electric Railways.

Oklahoma.—The constitutional convention has adopted a provision prohibiting steam or electric roads from charging more than 2 cents per mile, giving the railway commission power to exempt any road upon satisfactory proof that it cannot earn a reasonable income upon the money actually invested if not permitted to exceed the 2-cent rate.

Pennsylvania.—Four bills have been introduced in the legislature by Senator Campbell. One amends the trolley consolidation act of 1895 by providing that traction companies in country districts may sell or lease property or franchises which are owned, leased, operated or controlled to any other traction or motor power company incorporated in the state. Such companies may also contract with other companies for the operation of lines. The present law was framed to permit the consolidation of the companies in Philadelphia and Pittsburg only. Another bill gives electric companies the right to acquire the franchises of steam railway companies, to carry freight, and to make arrangements for the operation of steam railway cars over electric railway tracks. The bill also gives the president and directors of the street railway companies power to borrow money and to issue bonds without any limitation. The present law provides that money shall not be borrowed in an amount exceeding the capital stock subscribed and bonds shall not exceed double the amount actually paid in of the capital stock subscribed, "the proceeds whereof shall be actually expended in the construction and equipment of the roads." A fourth bill authorizes the companies to construct branches or extensions by resolution of the board of directors instead of by resolution of the stockholders. Proposed branches or extensions need not be within the general scope of the original charter. A bill has also been introduced in the legislature by Representative Robert Dearden of Philadelphia to compel street railway companies to provide each passenger with a seat. It also provides that if all the seats are occupied the companies shall not refuse passage, but must transport any passenger not provided with a seat for half fare. It further provides that a passenger having paid half fare may take a seat when one is vacated.

Mayor Guthrie's Views on Pittsburg Subway.

Mayor Guthrie of Pittsburg, on February 6 addressed the rapid transit commission of the city councils at their invitation on the subject of the proposed ordinance to give the Pittsburg Subways Company a franchise for a system of subways covering the entire city. He said in part:

"To provide a permanent basis for the settlement of terms of joint use by other companies the subway company should be required to keep a separate account of the cost of the construction of its down town system. This account should be audited by the comptroller or an auditor and the amount thus ascertained should be used in determining the amount to be paid for such joint use.

"The length of the franchise should not under any circumstance exceed 50 years, and that term should not be considered unless the public interests are fully safeguarded. Personally, I think 25 to 30 years a long term. We have no right to bind the future city to a system which may cripple its growth and subject the people to a great burden.

"Bonds for the construction of the line not to exceed the actual cost might properly be given as a lien on the franchise until paid, but provision should be made for a sinking fund to extinguish them. The capitalization of the company, either by bonds or stocks, should be limited to the cost of construction and not exceed 25 per cent in addition thereto. No increase of bonds or capital stock should be issued without the consent of the city, and then only if the amount be actually raised in cash and expended

for improvements. Cost and maintenance should be paid out of the earnings.

"The value of the franchise is solely in the power of the holder to tax the public for its use. It is not just to permit the holder to tax the public in order to pay interest and dividends on watered bonds and stocks, and even to withhold proper accommodations in order to reduce operating expenses, so as to leave a larger balance to be applied to such purposes.

"The company should not be permitted to sell or lease its lines or to consolidate with any company without the consent of the city. There should be a provision that transfers at all stations should be made with other lines, either surface or subway. The city must have power to compel the company to furnish adequate accommodations and service.

"All details of construction and operation should be determined before construction is begun. The city should have the right to select at least three consulting engineers to pass upon all plans.

"In order to require the company to bear its fair share of the city's expense it should pay each year an amount equal to the mileage fixed for that year on the cost of construction.

"It should be required to pay into the city treasury each year any balance of its revenue remaining after payment for operating and maintenance; 5 per cent interest on its bonds and 6 per cent on its capital stock.

"The city should have the right to buy the capital stock of the company at par any time after 25 years.

"The company should be required to render annual accounts to the comptroller, and there should be some limitation on the power of the company to absorb its surplus income by excessive salaries."

Western Society of Engineers.—The programme for the regular meeting of the Electrical Section of the Western Society of Engineers on February 15 included a lecture on "Direct-Current Compensators for Balancing Electric Circuits" by H. M. Biebel.

Thefts of Copper Wire on the Illinois Traction System.—Considerable trouble has been caused recently on the electric lines in the southern part of Illinois by thefts of copper wire. On Wednesday night, February 6, 200 feet of heavy trolley wire was stolen from the Illinois Traction Company's line between Bloomington and Peoria.

Louisville Railway Wage Increase.—President T. J. Minary of the Louisville Railway Company announced on February 9 that the directors had decided to increase the wages of all the company's employes who are paid by the hour one cent an hour. This includes trackmen, mechanics, motormen and conductors, whose wages vary between 15 and 21 cents an hour. About 1,500 men are affected by the increase, which will take effect at once.

Special Car for Tacoma Railway & Power Company.—An attractive special car is now being equipped in the Tacoma Railway & Power Company's shops. It will be equipped with cushioned chairs, buffet, tables, and the floor will be carpeted. The fittings throughout will be equal to those of the best modern private cars. It is primarily intended for the use of the officials of the road in inspecting the 200 miles of electric railway lines included in the system, and for the use of distinguished visitors. During the summer when the car is not required for official purposes it will be chartered to trolley parties to American lake and many of the other attractive points of interest on the roads.

Proposed Union Station at Dayton.—According to an assertion attributed to Col. E. C. Spring, manager of the Dayton Covington & Piqua Traction Company, the owners of all the lines entering the city of Dayton, O., have been trying to agree upon a union station to be erected here, but no definite answer has yet been received from the Schoepf roads. He said that some of the companies wanted a union passenger station, but not a station to be used for both freight and passengers by all the roads. The managers of the various companies met with the city council a few days ago and discussed the matter. It is possible that the old city building may be converted into a depot, but as yet nothing definite has been decided upon.

The Concrete Review.—The Association of American Portland Cement Manufacturers announces the publication of the Concrete Review, Volume 1, Number 1, of which appeared on February 1. The publication is to be semi-monthly and is to meet the growing demand for the most reliable information regarding the proper use of Portland cement and serve as an easily accessible guide to the best articles appearing in the various technical publications. Original articles will be published, together with extracts of articles which appear in other publications. The Concrete Review will be sent upon request addressed to the assistant secretary of the Association of American Portland Cement Manufacturers, Land Title building, Philadelphia.

Plan Bureau of Alliance Against Accident Frauds.—A meeting of representatives of steam railroads, traction companies, accident and liability insurance companies, public service and other corporations was held at the Great Northern hotel in Chicago on the evening of February 5 to consider the establishment of a local index bureau of the Alliance Against Accident Fraud. H. C. Wagner of the Employers' Liability Assurance Corporation was elected chairman and L. L. Austin of the Northwestern Elevated Railway secretary. No definite action was taken. Another meeting will be held in a short time. This index bureau receives daily from each local subscriber a report showing the name, age, address, attorney and physician of each individual who has made a claim upon the subscriber's company. The bureau sorts and classifies the reports and whenever a duplication of names of claimants, physicians or attorney is found the claim departments

of the companies affected are brought in touch for the purpose of finding out if the claim is fraudulent or exaggerated. Such bureaus have been established in Boston and New York and are said to be doing effective work at a small cost.

Los Angeles Cars Shipped on Their Own Wheels.—The Pacific Electric Railway Company, Los Angeles, Cal., recently received 52 new standard-gauge cars, which are now being fitted with electrical equipment at the Los Angeles shops. These cars will have multiple-unit control so that during the rush hours they may be operated in trains. It is of especial interest to note that in delivering these cars from the shops in St. Louis they were transported on their own wheels. While this practice is perhaps not unusual in the east where distances are comparatively short, it is worthy of note that experience has shown it to be feasible to deliver for a distance of 2,100 miles on their own wheels three trains, including 52 electric railway cars.

Organization of Shop Foremen.—The shop foremen of Brooklyn, Manhattan, Newark and vicinity met and formed an organization for the exchange of experiences and data on the equipment and repairing of rolling stock. It is hoped by the men that an exchange of ideas will be brought about which will be a great advantage both to the men and to the companies. Officers have been elected as follows: President, Clark Crather of Paterson; first vice-president, Miles Hoyt of Brooklyn; second vice-president, A. Dotschall of Manhattan; third vice-president, R. R. Myers of Flatbush; secretary and treasurer, John R. Case of Newark. An executive committee of seven members has been appointed to draw up a constitution and by-laws. The association will hold monthly meetings.

Cleveland Traction Situation.—The street railway situation in Cleveland still remains in the same condition as for the past month. President Andrews of the Cleveland Electric Railway and President DuPont of the Municipal Traction Company are still engaged in determining a basis on which to calculate the value of the Cleveland Electric property and have given out nothing as a result of their conferences except the statement that satisfactory progress was being made and that probably the negotiations will not be completed until some time next week. The thirty-day truce, during which all hostilities between the two companies were to be suspended, expired on February 10, and by agreement it was extended indefinitely, with a provision that it may be terminated upon 24 hours' notice from either side. Attorneys for both companies have filed in Judge Phillips' court a petition that the injunction case of the old company against the Forest City Railway be suspended until the result of the negotiations is known.

Committee on Municipal Ownership.—The membership of the committee on "Municipal Ownership" of the American Street & Interurban Railway Association for the work of the 1907 convention has been completed and now stands as follows:

C. W. Wyman, chairman, general manager Stone & Webster, Boston, Mass.

John A. Beeler, general manager Denver City Tramway Company, Denver, Colo.

George F. Chapman, general manager United Railroads of San Francisco, Cal.

H. M. Sloan, general manager Calumet Electric Street Railway Company, Chicago, Ill.

J. J. Stanley, general manager Cleveland Electric Company, Cleveland, O.

The names of members of the other committees that have been appointed may be found in the Review for February 2, page 161, and for February 9, page 203.

Electrification of Washington Terminal.—On January 29 the senate committee on the District of Columbia gave a final hearing to the railroad interests which are opposed to the bill applying the smoke law of the district of Columbia to the steam railroads doing business in Washington. Arguments against the bill were presented by representatives of the Pennsylvania and the Baltimore & Ohio. The point was made that the railroads had incurred great expense in providing terminals at Washington, which were far in advance of the needs of the city; that they had established freight yards outside of the city limits in order that the smoke nuisance might be reduced by keeping freight locomotives out of the city so far as possible, and that to force the railroads to assume the additional expense of electrifying the Washington terminal would mean great loss to the public, first by reason of the delay which must ensue before electrical installation would be completed, and secondly because of the terminal charge, estimated at \$5 per car, which would have to be assessed on cars within the district.

Trackage Agreement Between Boston & Worcester and Boston & Albany.—It is reported that a tentative agreement, involving important changes, has been entered into by the officials of the Boston & Worcester Street Railway and the New York Central Railroad. Among the interesting changes promised as the result of it is the reduction of the running time of the Boston & Worcester trolley air line cars between Worcester and Boston from 2 hours and 15 minutes to 1 hour and 30 minutes, and the establishment of the trolley freight business that has been under consideration by the Boston & Worcester officials for months. The agreement is to the effect that the Boston & Worcester road may run from Newton Highlands into Boston over the Boston & Albany circuit branch, and have its Boston terminals at the old Park square station, which the New York Central recently secured on a conditional sale, awaiting legislative sanction. By the carrying out of this agreement, the railroad can electrify its circuit branch, a step that has been under consideration. Another plan that the Boston & Worcester has in mind is the construction of a 3¼-mile boulevard from a point in South Framingham, opposite the South Framingham

muster field to Fayville, at the Southboro and Framingham line, to cost \$300,000.

New York Rapid Transit Affairs.—Chief Engineer Rice of the New York rapid transit commission, who was instructed to investigate the application of the United Engineering & Contracting Company, which is building the Pennsylvania tunnels in Thirty-second and Thirty-third streets, between Fifth and Sixth avenues, to be allowed to excavate by the method of open cuts instead of by boring, presented his report on February 7. Mr. Rice found that the character of the ground required open cut excavation but of less length than stated in the company's application. The commission heard protests from several property owners who declared that the open cut work would injure the foundations of their buildings and take trade away from the merchants. Mr. Philbin, of the contracting company, said that they would be compensated for all damage and the commission postponed the hearing for a week until an agreement on the question of damages could be reached. The commission approved the action of the committee on plans which on February 5 decided that if the Brooklyn Rapid Transit Company operates in the proposed bridge subway loop it shall be allowed to use the best type of cars of its present rolling stock equipment, instead of being required to use steel cars. The commission has ordered a public hearing for February 28 on the form of the proposed contract for the bridge subway loop.

San Francisco Employees Receive Increase of Wages.—It is reported that the board of arbitrators selected last fall to adjust the differences between the United Railroads of San Francisco and its employees, in regard to hours and wages, has decided that the company shall increase the wages of its employees 20 per cent and that the hours of labor shall remain as at present, 10 hours constituting a day's work. The unions directly interested in this decision are the local bodies of the Amalgamated Association of Street and Electric Railway Employees of America, International Brotherhood of Electrical Workers, Stationary Firemen and Street Railroad Construction Workers. The company's refusal to accede to the demands of the unions resulted in a strike which lasted from August 26 to September 5, 1906, almost completely tying up the street-car service of San Francisco, which was terminated on September 5 by an agreement to submit the demands of the men to arbitration by a board consisting of one man chosen by the unions, one by the company, and the third by the other two. A few days later President Calhoun offered increases to the different unions involved, but they rejected the offers in favor of arbitration. The board of arbitrators consisted of William H. Beatty, Major Frank McLaughlin, and Rev. Peter C. Yorke. The increase in wages is to take effect from the date of the end of the strike, September 5.

Plans for a Municipal Subway in St. Louis.—Senator J. J. Prendergast of St. Louis on February 9 introduced into the Missouri legislature a bill to permit the city of St. Louis to build subways. The bill, which was drafted by Mayor Wells and approved after certain amendments by a committee of fifteen representative citizens, provides that any city of 100,000 or more inhabitants may build or acquire subways within their corporate limits to be exclusively owned by the city, for the transportation of passengers, baggage, express and freight; that such cities may operate subways or lease them for a period not exceeding 50 years, and may regulate their use and the construction and operation of cars therein. It is also provided that such cities may issue municipal bonds, at not less than par, payable out of the income from the subway. In connection with this bill an amendment to the state constitution was also introduced, which provides for an increase of the borrowing powers of such cities for the purpose of building or acquiring subways. According to the amendment no indebtedness may be incurred by a city for this purpose unless approved by two-thirds of the voters, and unless provision is made for an annual tax sufficient to pay the interest on such indebtedness and to constitute a sinking fund for the payment of the principal thereof within 30 years. No definite plans for the actual construction of a subway have yet been considered, but it is desired to secure the necessary legislation to make such a step possible as soon as it is deemed necessary or feasible.

Six Fares for a Quarter in Minneapolis.—The Minneapolis city council has decided that the people of Minneapolis are entitled to six street car rides for a quarter. Friday evening, February 8, the council passed an ordinance requiring the Twin City Rapid Transit Company to "sell and provide for the sale of tickets, each good for transportation of one passenger for a continuous passage over the street railway lines of said company in said city at the rate of not less than six tickets for twenty-five cents." The ordinance was drafted by Attorney C. B. Holmes, a member of the council. The street railway is expected to resist the ordinance, when it is given the mayor's signature and made a law, relying on the provisions of an ordinance of 1890, confirming an act of the council permitting the street railway company to operate all its railway lines in the city by electricity. This ordinance provided for a minimum fare of five cents a ride. However, the ordinance which it continued and which names the five cent fare is taken by advocates of the new measure to be a license merely, revocable at the will of the council. It is believed that St. Paul will also take up the crusade for lower fares. A special committee of the city council appointed to confer with the Twin City company's officials in regard to the street-car service on February 11 informed W. J. Held, the general manager, that in the event of Minneapolis getting six fares for twenty-five cents the same concession would be demanded for St. Paul, in spite of the fact that the franchise of the company seems to allow it to charge a straight five-cent fare during the life of the franchise. This announcement was accompanied by a demand for improved service and Mr. Held made several proposals to that end, which will be considered by the council.

Construction News

FRANCHISES.

Albia, Ia.—A franchise has been granted to C. A. Ross, Chicago, C. B. Judd, Pittsburg, A. S. Kimberly, New York, and Calvin Manning, Ottumwa, Ia., to operate a street railway in Albia. The promoters agree to have one mile of line in operation within a year.

Auburn, N. Y.—The Auburn & Ithaca Traction Company has been granted a franchise to enter the city with the provision that within two years from the date on which permission to build is granted by the railroad commissioners the line must be completed. The franchise also provides for the improvement by the company of all streets through which its line passes.

Carbondale, Ill.—The Southern Illinois Transit Company, which proposes to build an interurban line from Carbondale to Murphysboro, Carterville, Herrin, Johnson City and other points, has been granted a franchise to lay tracks over certain of the principal streets of the city. The franchise specifies that actual construction shall begin within three months after acceptance and that within one year thereafter there shall have been completed and in operation a single or double track railway from a point on Main street to one of the following points: Carterville, Herrin or Cambria. A bond of \$5,000 is to be given as a guaranty that \$5,000 shall have been expended on actual construction by the first of next July.

East Liverpool, O.—At a recent meeting of the stockholders of the Ceramic City Light Company, the Wellsville Light & Power Company of this city and the People's Light & Power Company of Chester, W. Va., it was agreed to surrender the charters of the corporations to the secretary of state at Columbus, O. These companies have been in operation many years with the exception of the People's, which was organized to furnish light to the city of Chester and also to East Liverpool, but which never exerted its authority. The business of all three companies was merged into the affairs of the East Liverpool Traction & Light Company, which now controls the traction and light properties in this section of the state.

Grand Rapids, Mich.—The Grand Rapids Electric Company, a new organization, has applied for a franchise for right-of-way through the city from the northwest to the southwest side and from the southwest side to the heart of the city for freight, passenger, mail and express service. It is reported that this is a part of a projected interurban system which is to begin at Alpena and run through West Branch, Gladwin, Mt. Pleasant, Edmore, Greenville, Belding, Rockford, Grand Rapids, Kalamazoo, Battle Creek, Coldwater, Camden and into the state of Ohio. Another part of the project, it is stated, contemplates a road from Grand Haven to Lansing through Grand Rapids. The application has been referred to the committees on streets and ordinances.

Kankakee, Ill.—The Kankakee Electric Street Railway, the North Kankakee Electric Street Railway and the Kankakee & Western Electric Railway have been granted new 20-year franchises. It is stated that the franchises under which the companies were operating were illegal because the consent of the abutting property holders had not been obtained.

Lexington, Ky.—The Central Kentucky Traction Company, represented by Louis des Cognets, president, and Judge J. R. Morton, attorney, has applied for a franchise to construct and operate a traction line connecting Lexington with Nicholasville, Lancaster and Richmond, Ky.

Marysville, Cal.—A franchise has been granted to the Northern Electric Company, Chico, Cal., to build an electric line in certain streets of Marysville. The franchise as originally drafted and applied for last November, was objectionable to the council on account of certain provisions omitted and incorporated. The company has now conceded these points, among which are the elimination of the third-rail clause and the cutting-out of the right of way asked for on Orange street. The company also agrees to place lights at certain points along its line.

Mt. Vernon, O.—The city council has been asked for a franchise to build an electric railway in Mt. Vernon, by two different companies: the Cleveland & Southwestern Traction Company and the Mansfield & Southern Traction Company, the former represented by Roberts & Abbott of Cleveland, and the latter by Frank L. Beam and Dwight E. Sapp, also Judge Maxwell of Mansfield, O. Both companies desire to operate over practically the same streets in Mt. Vernon. The petitions have been referred to the board of public service and the city solicitor.

New Castle, O.—The 50-year franchise recently applied for by the New Castle & New Wilmington Street Railway Company has been granted by the city council with the provision that the road must be completed and cars running within two years from the date of its acceptance.

Spokane, Wash.—The city council in committee of the whole has reported for passage the ordinance granting the Spokane & Inland Empire Railroad a franchise for a subway nearly a mile long connecting its freight and passenger terminals in the city. A map showing the route of this subway and an outline of the company's plans in connection with it was published in the Electric Railway Review for February 2, 1907, page 148. The franchise is perpetual and practically free from restrictions. Work must begin within two years and be completed within five years.

St. Charles, Mo.—St. Louis capitalists, represented by H. H.

Wilmes, are asking for a franchise to operate an electric line over the principal streets of St. Charles. It is stated that the proposed line will connect with the St. Louis St. Charles & Western Electric Railway across the Missouri river, which, it is said, may mean that the United Railways Company of St. Louis is interested.

Waxahachie, Tex.—The Central Texas Traction Company has been granted a six-months extension to its franchise for entering the city with an interurban line. The franchise expired on February 7 and the extension was asked for to allow more time in which to decide on the streets over which it shall run.

Weatherford, Tex.—G. M. Bowie, of Weatherford, representing Chicago capitalists, has been granted a franchise to build an electric line in Weatherford which it is said will be a part of an interurban line connecting Weatherford and Ft. Worth. One mile of track must be completed within one year from the date of the franchise.

Winona, Minn.—The La Crosse & Winona Traction Company has applied for two 50-year franchises, one for furnishing light, heat and power for commercial purposes and the other for a street railway. The first franchise gives the company the right to furnish electricity from a plant to be located in the city and permission to control and maintain all new lines it may acquire in the city as well as the present lines. Rates are quoted in the franchise for light and power and an important section provides that they shall be adjusted every 10 years by three adjusters, one appointed by the council, one by the company and the third by the two already named. The street railway franchise provides that cars shall be in operation from Winona to Galesville within 18 months and to La Crosse within two and a half years, with permission to run tracks into the city and on the present tracks or on new ones to be constructed by the company. The council probably will not act on the measure for some weeks. C. M. Morse, president, Winona, Minn.

RECENT INCORPORATIONS.

Alfarata Electric Street Railway Company.—Incorporated in Pennsylvania to build an electric railway from Alexandria to Tyrone Forge, Pa. Capital stock \$75,000. Incorporators: John Phillips, president; Samuel I. Spyker, secretary, and W. G. Kenaga, treasurer. Headquarters, Altoona, Pa.

Big Valley Street Railway.—Incorporated in Pennsylvania to build an electric line from Mill Creek by way of Airy Dale, Allensville, Belleville and Kishacoquillas Seminary to Reedsville, Pa., 27 miles. Incorporators: R. W. Jacobs, H. E. Steel, F. Blair, I. Isenberg, George C. Wilson and Wallace H. Wilson.

Brownsville Masontown & Smithfield Railway.—Incorporated in Pennsylvania to build and operate an electric line between Brownstown and Smithfield, Pa., 20 miles. Capital stock, \$150,000. Incorporators: W. J. Sheldon, president, McKeesport, Pa.; W. J. Dain and C. V. Kennedy.

Decatur Taylorville & Litchfield Traction Company.—Incorporated to build a railroad from Decatur to Litchfield, Ill. Incorporators, Dudley Taylor, Frederick Job, Thomas B. O'Connell, Alma L. Dorothy and W. W. Taylor.

Franklin & Towamensing Electric Street Railway.—Organized and soon to apply for a charter to build an electric line from Weissport through North Weissport and Phifer's Corner to Harry, to Parryville and thence to Bowmanstown, Hazard, Palmerton and Millport, Pa. Incorporators: A. P. Berlin, John T. Semmel, Dale Craig, H. J. Bretney and T. J. Fretz.

Hagerstown & Northern Railway.—This company has been incorporated to take over the Hagerstown & Northern Railway Company and the Franklin Railroad Company. The Hagerstown & Northern extends from Hagerstown to Reid, and the Franklin line runs from Reid to Shady Grove, Franklin county. Christian W. Lynch of Harrisburg is president.

Juniata Valley Street Railway.—Incorporated in Pennsylvania to build an electric line from Huntingdon to Mt. Union, Pa. Incorporators: R. W. Jacobs, H. E. Steel, F. Blair, I. Isenberg, Wallace Wilson and George C. Wilson.

Lyndhurst & Sherando Railroad.—Incorporated in Virginia to construct a line from Lyndhurst to Mount Troy in Augusta county, 6 miles. Capital stock, \$50,000. Incorporators: J. H. Ralston, president; J. B. Sleman, Jr., secretary and treasurer; H. T. Winfield, F. L. Siddons, James Sharp and Harry Standford, all of Washington, D. C., and H. L. Millner, Morgantown, N. C.

Mattoon, Ill.—The Decatur Sullivan & Mattoon Transit Company has been granted a 50-year franchise to build and operate over certain streets in Mattoon. The franchise was passed as originally drafted by the company with the exception that 28-foot iron poles were substituted for the wooden poles specified.

Rock Island Construction Company.—Incorporated to continue the construction of the Rock Island Southern Railway from Galesburg to Rock Island Ill. Capital stock, \$500,000 with a right to increase to \$2,000,000. Incorporators: G. H. Higbee, president, Burlington, Ia.; E. C. Walsh, vice-president, Clinton, Ia.; C. H. Walsh, treasurer, Burlington; J. W. Walsh, secretary, Davenport; W. B. Young, W. W. McCullough, S. S. Halnan, Monmouth; M. A. Walsh, Clinton; G. W. Gale, Galesburg; Albert Hidden and L. N. Elwards, St. Louis. It is stated that the line connecting Rock Island, Monmouth and Galesburg will be started as soon as the route has been decided upon.

Williamson Traction Company.—Incorporated to construct and operate a street railway in Williamson and Mingo counties, West

Virginia, also in Pike and Martin counties, Kentucky. The capital stock of the company is \$50,000, of which \$500 has been subscribed and \$50 paid. The incorporators are W. J. Williamson, E. J. Wilcox, George W. Brown, H. Williamson and C. H. Jones, all of Williamson, W. Va.

TRACK AND ROADWAY.

Alliance, O.—Surveys are being made for an electric line from Akron, to Alliance and Youngstown, O.

Atlantic Northern & Southern Railway.—H. S. Rattenborg, general manager, Atlantic, Ia., writes that contracts are to be let about March 1 for grading on this line from Manning to Valisca, Ia., 72 miles. Surveys have been made from Atlantic to Manning, 40 miles. The motive power has not yet been determined, but will be either electricity or gasoline motors. J. A. McWaid, of Atlantic, president.

Batavia Medina & Ontario Railway.—It is reported that the Orleans Construction Company, of Buffalo, N. Y., will soon begin the construction of this line from Olcott to Batavia, N. Y.

Beloit Traction Company.—The Rock River Construction Company, which has the contract, has placed orders for all the materials and equipment for the proposed city lines in Beloit, Wis. The American Trust & Savings Bank of Chicago has been made trustee for the bondholders. The Rockford & Interurban Railway of Rockford, Ill., is interested.

Boston Elevated Railway.—This company has taken all of the land necessary for its elevated extension from the North station to the Charles river dam, Boston, Mass., which has been authorized by the Massachusetts railroad commission. Work must begin within six months from the date of the grant of location, December 22, 1906, and be completed within 3½ years.

Boston, Mass.—Representative M. M. Lomasney has introduced a bill into the Massachusetts legislature asking that the Boston Rapid Transit Commission be directed to look up the matter of a subway in the West End, from the Charles river dam to a point near the North station, making connection with the various subways and tunnels at that point. This subway would practically follow the line of the proposed elevated structure of the Boston Elevated Railway.

Buffalo Niagara & Toronto Railway.—Plans have been filed for the construction of this line from Niagara-on-the-Lake, via St. David's, to St. Catharines, Ont.

Charleston & Summerville Electric Railway.—About ten miles of the grading has been completed between Charleston and Summerville, S. C., and two grading crews are now at work, one near each end of the line. D. E. Baxter & Co. of New York have the contract.

Chicago Lake Shore & South Bend Railway.—It is reported that rapid progress is being made on the construction of this road from South Bend, Ind., to Kensington, Ill. The grading has been completed from New Carlisle to South Bend. The strip from New Carlisle to Michigan City will be graded soon, contracts having been let. Grading west of Michigan City is now in progress. Proposals are being received for the grading from Dune Park to Gary, a distance of 12 miles. A contract has been let for the strip from Gary to the Calumet river, a distance of 5 miles, and the remainder of the grading will begin as soon as weather conditions will permit. All the steel necessary for the construction of the road has been ordered.

Consolidated Railway.—It is reported that this company is planning to build a line from Adams, Mass., to the summit of Mt. Greylock. The plan is to build an electric line to the base of the peak and a cog-rail line to the summit. As the summit of Greylock is high above the surrounding country, the building of that portion of the line will be an expensive undertaking. Surveys are being made, and it is understood that a move toward procuring the necessary franchises will be made in the near future.

De Kalb-Sycamore Electric Company.—This company, which now has a line in operation between De Kalb and Sycamore, Ill., has been reorganized and it is stated that the line will be extended from Sycamore to Belvidere. J. H. McMichael of Chicago, president.

Derry & Goffs Falls Street Railway.—The board of railroad commissioners has acted favorably on the petition of this company to build an electric line from Derry to Goffs Falls and it is stated that work will be started as soon as possible to enable the road to be in operation by the middle of the summer.

Ft. Wayne & South Bend Railway.—It is reported that this company, which was incorporated last year to build a road through Syracuse, Milford Nappanee and Wakarusa to Ft. Wayne, Ind., has been financed by a syndicate headed by H. L. Turner, of Chicago, and that a construction company is being formed to do the work.

Ft. Wayne & Springfield Railway.—It is reported that work is to begin early this spring on the continuation of the line from Decatur toward Celina, Ind., via Pleasant Mills, Willshire and Chattanooga. The road has been in operation from Ft. Wayne to Decatur for about two weeks. W. H. Fledderjohann, president, Decatur.

Gainesville Whitesboro & Sherman Railway.—Thomas S. Wayne, chief engineer, Gainesville, Tex., writes that grading will be resumed about March 1, on this line from Gainesville to Sherman, Tex., 29.4 miles, via Callisburg, Whitesboro and Sadler. About six

miles, from Gainesville to Milepost 7, was graded last year and the entire route has been surveyed. M. M. Elkan, of Macon, Ga., has the contract. G. A. Hassinger, New Orleans, La., is president.

Indianapolis & Louisville Traction Company.—The work of setting poles for this line between Jeffersonville and Seymour, Ind., has been started at Seymour and tracklaying is in progress. Several miles of track has been laid at the southern end of the line. The power house and car barns at Scottsburg are well under way and are expected to be completed by April 1. John E. Greeley, Jeffersonville, superintendent of construction.

Joplin & Pittsburg Street Railway.—It is reported that this company has made preliminary surveys and financial arrangements and has secured the necessary franchises for its proposed line from Joplin, Mo., to Pittsburg, Kan. D. H. Holmes, of Kansas City, Mo., president; D. K. Wenrich, Joplin, secretary.

Kalamazoo Gull Lake & Northern Railroad.—It is stated that this company has made the necessary financial arrangements and that construction will begin in the spring on the line from Kalamazoo to Gull Lake, Mich. J. T. Upjohn, of Kalamazoo, president.

Lafayette & Logansport Traction Company.—Chief Engineer H. L. Weber of Ft. Wayne, has announced that 16 miles of track has been laid between Clymers and Rockfield, Ind., on this extension of the Ft. Wayne & Wabash Valley from Lafayette to Logansport. Material has been distributed between Clymers and Logansport.

Los Angeles-Pacific Company.—It is stated that this company will begin work in less than 90 days on the construction of a \$5,000,000 subway in Los Angeles, to be completed in two years. C. H. Ellison, chief engineer, Los Angeles.

Minneapolis Rochester & Dubuque Traction Company.—It is reported that this company has secured the greater part of the right of way for its proposed line from Minneapolis, Minn., to Dubuque, Ia. Secretary William P. Mason, of Minneapolis, has announced that construction work will begin as soon as the weather permits and that beginning May 1 12,000 tons of steel rails a month will be delivered.

Minster Loramie & Southern Railway.—R. B. Anderson of Wapakoneta, O., writes that this company, which was recently incorporated to build an electric line from Minster to Versailles, O., 16 miles, is not yet organized. Grading is to begin some time next fall.

New York, N. Y.—Eridge Commissioner J. W. Stevenson advertised on February 7 for bids for the construction of the elevated railway connection on the Brooklyn plaza of the Williamsburg bridge. The bids will be opened on Thursday, February 21, and the contract must be completed by August 30, 1907. The contractor will be required to begin work within five days of the date of certification of the contract by the comptroller. A bond of \$30,000 is required. This connection has been delayed because there have been no plans for a terminal or connection on the Manhattan side of the bridge. The city has now determined on a subway loop for the connection between the Brooklyn and Williamsburg bridges, and if the Brooklyn Rapid Transit Company gets a contract to run cars in the subway it may run across the Williamsburg bridge from its Brooklyn tracks and into the subway loop.

Ocean Shore Railroad.—John B. Rogers, chief engineer, San Francisco, says that this road will be completed from San Francisco to Santa Cruz, Cal., by October 1. Over 60 per cent of the grading and practically all of the fills and bridges have been completed.

Rice Lake, Wis.—The Rice Lake Milling & Power Company is interested in a project to build an electric railway from Rice Lake to Cameron, Barron and Prairie Farm, Wis.

San Bernardino Valley Traction Company.—A. D. Denham, Jr., president, San Bernardino, Cal., writes that contracts are to be let for grading the line from Colton to Riverside, Cal., 6½ miles. Surveys have been completed and construction is to begin in about three months. O. K. Dunham of San Bernardino is chief engineer.

Scranton Railway.—President J. J. Sullivan of Philadelphia, has announced that the company intends to expend \$720,000 on improvements in Scranton, Pa., beginning this spring. The plans include several important extensions of lines, details of which are not stated, double-tracking of existing lines, improvements to car barns, a larger power house and new cars.

Spokane & Big Bend Railway.—W. H. Plummer, president, Spokane, Wash., states that rapid progress is being made in clearing the right of way for the line from Spokane to Davenport, Wash., 40 miles, and that contracts for the grading are being let. Within three months 1,000 men will be at work on the line and it is expected to have the work completed by January 1, 1908. The right of way has been secured as far as Crystal City and the necessary franchises have been granted. At Seven Mile Bridge, below Spokane, the road will connect with the Spokane & Inland Railway and enter the city over its tracks. To cross the Spokane river at this point a \$20,000 bridge will be erected, plans for which are now being prepared.

Southwest Missouri Electric Railway.—The viaduct between Webb City and Cartersville, Mo., over the tracks of the Missouri Pacific and St. Louis & San Francisco railroads, was opened for traffic on January 31. This viaduct, which was described in the Electric Railway Review for August, 1906, is about ½ mile long and contains three steel bridges. The route over the viaduct

is much more direct than the old route and eliminates seven grade crossings. E. J. Pratt, chief engineer, Webb City, Mo.

Tacoma Railway & Power Company.—Manager W. S. Dimmock of Tacoma has announced that work is to begin at once on the extension of the P street line to the city limits, Tacoma.

Tecumseh-Norman Traction Company.—An official report states that grading is to begin in April on a line from Tecumseh to Norman, Oklahoma, 34 miles, which has been surveyed. W. E. Powell, Tecumseh, president; W. J. Beebe, Shawnee, chief engineer.

Toledo & Indiana Railway.—This company, it is stated, now has a clear right of way for its proposed extension from Bryan, O., to Waterloo, Ind., with the exception of two or three little strips between Bryan and Milburn. The right of way is 66 feet wide, paralleling the Lake Shore & Michigan Southern Railway the entire distance.

United Railways & Electric Company (Baltimore).—Preparations are being made to begin work on the proposed line from Towson to Lutherville, Md., about 2 miles. Surveys have been completed and the necessary property has been acquired.

Utah Light & Railway Company.—It is reported that this company has ordered 80 miles of rails and 150,000 ties to be used in the reconstruction of the Salt Lake City system. Seventy miles of the rails are 65-pound steel and 10 miles are of 85-pound steel, for use in the business portions of the city where traffic is heaviest. Shipments are to begin about March 1, at which time the work will begin. O. A. Honnold, Salt Lake City, Utah, chief engineer.

Warren Company.—H. L. Knickerbocker, chief engineer, Bisbee, Ariz., writes that grading is to begin on February 20 on this five-mile line from Warren to Bisbee, Ariz. Haggitt, Girard & Smith, of Prescott, Ariz., have the contract for grading, bridges and tracklaying. Eighty-pound rails have been specified. The company is still in the market for switches, frogs and other special work. The road will have 100-foot radius curves and a maximum grade of 7 per cent. L. W. Powell of Bisbee is president.

Wrightsville & York Street Railway.—This company, a subsidiary of the York County Traction Company, has filed with the recorder of York county, Pa., notice of its intention to build an electric line from Wrightsville to Columbia, over a double deck which is to be built by the Pennsylvania Railroad on its bridge across the Susquehanna river.

Yakima Intervalley Traction Company.—The report of the engineer who made the surveys has been approved by the directors, and it is announced that construction will begin at once on the line from North Yakima into the Moxee valley and to Zillah, Wash., 24 miles. Another line is to extend to Wide Hollow, west of North Yakima. W. A. Beli of North Yakima is interested.

POWER HOUSES AND SUBSTATIONS.

Alton Granite & St. Louis Traction Company.—Superintendent R. W. Bailey, Alton, Ill., is reported to have announced that this company has appropriated \$40,000 for improvements to its power plant at Alton.

Boston Elevated Railway.—It is reported that arrangements are now about completed for enlarging the power houses so as to supply 12,000 additional horsepower. It is planned to place two new generators in the Lincoln Wharf power house, one in the Charlestown power house and one at the Harvard power house.

Citizens' Electric Street Railway.—It is stated that this company, of Newburyport, Mass., will erect a substation near Salisbury, Mass., in which two 300-kilowatt transformers and the other necessary equipment will be installed.

East Liverpool Traction & Light Company.—The boiler capacity of the power plant at East Liverpool, O., is to be increased by installing two 500-horsepower Stirling boilers. Orders for the new equipment have been placed.

Indiana Columbus & Eastern Traction Company.—It is stated that this company proposes to erect a \$200,000 power house either at Lima or Bellefontaine, O., to supply the line which the company intends to build from Lima to Bellefontaine and from Lima to Defiance. J. L. Adams, general manager, Cincinnati, O.
